The Indian region excels all the other equatorial regions Ophi- in the great variety of generic types and number of diana. species of Snakes. The latter amount to no less than four hundred and fifty, which is nearly one-third of the total number of species known. They are referable to about one hundred genera, of which the majority do not range beyond the limits of the region. Of higher groups (termed families for the sake of convenience), the *Xenopeltidae*, *Rhinophidae*, *Oligodontidae*, *Xenodermidae*, and *Acrochordidae* are peculiar to, and characteristic of, this fauna,—but not more so than a number of genera which will be mentioned presently.

Of *Typhlopidae* more than twenty species are known.

Of *Tortricidae*, the genus *Cylindrophis* is spread over several of the subregions.

The *Calamariidae* are represented by a whole string of genera, of which thirteen are peculiar to the region. The most characteristic and geographically most important types are *Calamaria*, with twenty-four species, spread over the archipelago and the eastern parts of the continent, and *Aspidura* and *Haplocercus*, with four species, which are limited to Ceylon and southern India.

Species of those generalized forms which are termed *Coronellidae* and *Colubridæ* are likewise numerous (sixty-six species), and referable to seventeen genera, of which ten are limited to this region. In the north-western and northern parts the genus *Zamenis*, which is one of the most characteristic types of the warmer parts of the Euro-Asiatic fauna, is represented by six species.

Freshwater Snakes are abundant in genera, species, and individuals. Of *Tropidonotus* alone some forty very distinct species have been described, besides three others which are sufficiently differentiated to deserve generic separation. Of the so-called *Homalopsidae* all the genera, twelve in number, are peculiar, and the great development of these Snakes is, therefore, one of the most striking features of this region.

Besides two species of *Psammophis* allied to African forms, a distinct genus *Psammodynastes* has a wide range over the eastern parts of the continent and the archipelago.

Tree Snakes are represented by eight genera and twenty-six species, mostly characteristic forms.

³ Its existence in Australia is extremely doubtful.

⁴ The statement that specimens of *Trionyx* had been obtained by Ida Pfeiffer in Amboyna rests upon a misunderstanding, like that of the discovery of a Barbel by the same traveller in the same island. Dr Jentink also informs us that none of the Freshwater Turtles in the Leyden Museum came from islands east of Java and Borneo.

Dipsadidae are more numerous (eighteen species) than in the other equatorial regions.

Elachistodon and *Hologerrhum* may be mentioned as remarkable types not found elsewhere, but with a very local distribution.

The development of *Lycodons* India has in common with Africa; but the genera, six in number, are distinct.

Also the presence of gigantic Snakes of the genus *Python* is a feature which India shares with Africa.

Of *Erycidae* three species are Indian, *Gongylophis* and *Cursoria* being peculiar to the region.

Poisonous Snakes are numerous, the proportion to innocuous Snakes being as 1:10. Out of forty-six species, only two belong to the family of true Vipers, and they are restricted to the Indian peninsula with Ceylon, one (*Echis*) being even specifically identical with the African species, and the other (*Daboia*) having its only congener in the Mediterranean district. The remainder of the poisonous Snakes belong to the *Elapidae* and *Crotalidae* or Pit Vipers. The former are represented by six genera, of which no less than five are highly characteristic of the region, whilst the Cobras (*Naja*) are equally distributed over Africa. Of Pit Vipers five genera have been distinguished, the most characteristic being an arboreal form, *Trimeresurus*, with seventeen species. Also the other five genera are peculiar to India, with the exception of the genus *Halsys* which is Central-Asiatic.

The relations of the Indian region to the others will be considered as we proceed with the accounts of those faunas. Japan, with regard to its Reptilian fauna as a whole, must be referred to this region. This is clearly shown by the presence of species of *Ophites*, *Callophis*, *Trimeresurus*, *Tachydromus*,—characteristically Indian forms, with which species of *Clemmys*, *Trionyx*, *Gecko*, *Halsys*, and some Colubrids closely allied to Chinese or Central-Asiatic species are associated. The few Reptiles inhabiting the northern part of Japan are probably Palearctic species.

2. *The African Region.*—Owing to its strictly continental character and diminished variety of physical features, this region is inhabited by a much smaller number of Reptiles than one might be led to expect from the large extent of its geographical area. There are but few small outlying islands, furnishing a small number of interesting additions to this fauna. Madagascar, indeed, would supply a considerable contingent of distinct forms, but it is questionable whether this large island should be united with the African region, as we shall see hereafter.

The African region is characterized by the development of three of the four principal divisions of terrestrial Chelonians, viz., *Testudinidae*, *Chelydidae*, and *Trionycidae*; the *Emydidae* are absent, being represented by one species only, in the north-western corner of the region (*Emys platyceps*). The thirty-seven species are distributed thus:—

Testudo,	with 16 species	
Chersine,	" 1 "	21
Pyxis,	" 1 "	
Cinyxis,	" 3 "	
Emys,	" 1 "	
Dumerilia,	" 1 "	9
Sternotherus,	" 7 "	
Pelomedusa,	" 1 "	
Trionyx,	" 2 "	6
Cycloderma,	" 4 "	

The majority of the genera are peculiar, viz., *Chersine*, *Pyxis*, *Cinyxis*, *Dumerilia*, *Sternotherus*, *Pelomedusa*, and *Cycloderma*; and no other region shows a similar development of Land Tortoises. This last type has not only diverged into four genera, but is also represented by several of those gigantic forms which survived into geologically recent times. In the African region they inhabited only the neighbouring oceanic islands, viz., the Aldabra group, Mauritius, and Rodriguez; out of the eight species, which have been recognized chiefly from their osseous remains, one only survives at the present day. Also in Madagascar fossil remains of gigantic species, which must have been contemporaries of *Epyornis*, have been discovered by Granddidier; but on the continent no trace of these large creatures has been found hitherto. The Chelonians of the eastern and western halves of the continent do not essentially differ from each other, but *Trionyx* does not extend southwards beyond the tropic.

Of *Crocodylidae*, *Crocodylus* is represented by three or four species. Alligators are absent.

Of the families of Lizards inhabiting Africa the majority occur in the southern portion. *Agamidae* are numerous,

and represented chiefly by terrestrial forms. The *Geckonidae*, *Scincidae*, *Lacertidae*, and *Varamidae* are likewise well represented; *Eublepharidae* by a single genus and species in West Africa. The presence of several genera of *Amphisbenidae*, some of which are even identical with South-American, is highly suggestive. *Gerrhosauridae*, *Zonuridae*, and *Anelytropidae* are peculiar to tropical Africa; but the most important feature of this Lacertilian fauna is the almost universal distribution of *Chamaeleons* in numerous and highly specialized species.

Leaving aside, for the present, the island of Madagascar, we estimate that the number of species of African Snakes does not exceed two hundred, which are referable to about seventy genera, of which no less than fifty do not range beyond the limits of the region. On the whole the east coast genera are different from those of the west coast, but in the southern parts no such differentiation can be shown. Very little is known as regards the range of the species and genera towards the central districts. As regards higher groups only two families, the *Dasypeltidae* and *Dinophidae*, are peculiar to Africa; and, although they have a wide range over the region, they consist of very few species only. Other families show a greater variety of genera and species here than in any other part of the globe. The almost entire absence of the genus *Tropidonotus* and the scanty representation of Colubrids are very noticeable features. Poisonous Snakes are numerous, all the various families being well represented, with the exception of the Pit Vipers; singularly enough innocuous Colubrine Snakes with facial pits occur (*Bothrophthalmus*, *Bothrolycus*).

Of *Typhlopidae* nearly forty species have been described, and, besides, the *Stenostomatidae* are represented by seven species.

Eight out of ten Calamaroid genera are peculiar to this fauna, and remarkable is the frequency with which among them the sub-caudal shields coalesce into a single series.

The *Caronellidae* are represented by some twenty species, but no true *Coluber* occurs, the four species which approach this type most closely belonging to distinct genera (*Scaphiophis*, *Xenurophis*, *Herpetathrips*).

Almost entire absence of *Tropidonotus* is a characteristic feature of this fauna. Also of other Freshwater Snakes only six genera with seven species are known.

The small family of *Psammophidae* is well represented by three genera and nine species, of which six belong to *Psammophis*.

Of Tree-Snakes there are six genera, of which *Ahaetulla* (*Philothamnus*) is most generally distributed, in twelve species.

Of *Dipsadidae* there are five genera and ten species, four of which belong to *Dipsas* proper.

The *Lycodonts* are as well developed as in India, by seven genera and fourteen species; all the genera are peculiar to Africa, and some of them are modified for an arboreal mode of life.

Of *Python*s three species are distinguishable; but, besides, a member of the Booid family (*Pelophilus fordii*) occurs on the west coast. Two species of *Eryx* occur.

Poisonous Snakes are extremely numerous, the proportion to innocuous Snakes being as 1:5. Of *Elapidae* four genera occur, among which *Naja* figures with at least two species; besides this family the *Dinophidae* are a remarkable and characteristic type, having assumed entirely the appearance and mode of life of Tree Snakes. The *Atractaspididae*, with three genera and thirteen species, are likewise almost entirely African, only one other type (*Dinodipsas*) having been recently discovered in Venezuela. Pit Vipers are absent, but the largest forms of *Viperidae* are developed in this region, this family being represented by four genera and twelve species. The singular genus *Atheris* is a real Tree Viper with prehensile tail.

The Reptilian fauna of Madagascar is a most remarkable mixture of types belonging to different regions, which cannot be accounted for in the present state of our knowledge of the geological changes that have taken place whilst the present fauna was already in existence.

The Chelonians¹ offer a marked point of distinction from those of

¹ The Chelonians of Madagascar require a thorough critical examination; some of the species which are recorded as having been brought from that island have been evidently introduced from the African continent. Others, as also certain species of Snakes, are certainly not natives of Madagascar.

Africa: no *Trionyx* occurs in Madagascar. On the other hand species are found of *Testudo*, *Chersine*, *Sternotherus*, and *Pelomedusa*, which are spread also over a greater or lesser area of the continent. Two Chelonians, *Pyzis* and *Dumerilia*, are peculiar to Madagascar, the latter nearly allied to the South-American *Pellocephalus*. The Madagascar Crocodile is closely allied to the common African species; and its presence in the island can be easily accounted for.

Among the Lizards we find a distinctly South-American element in two Iguanoid genera, *Hoplosternum* and *Chalarodon*, replacing the Old World *Agamidæ*. The absence of *Varanidæ*, *Lacertidæ*, and *Amphisbænidæ* removes Madagascar from Africa, whilst the extraordinary development of *Chamæleonidæ* (more than twenty species) and the presence of *Gerrhosauridæ* and *Zonuridæ* are important features common to both. A very small family (*Uroplatinæ*) is peculiar to Madagascar. No special relation to the Indian region is shown by this Lacertilian fauna.

With regard to Ophidians, Madagascar has hardly anything in common with Africa. The African fauna is characterized by the great development of Lycodonts,—they are absent in Madagascar; and of the four families of African poisonous Snakes Madagascar does not possess a single one. When we analyse the affinities of the twenty-seven species known at present from Madagascar, we arrive at the following conclusions:—

1. Snakes without distinct relations to any particular region:—*Typhlops* (six species), *Ablabes* (one species), *Ithyocyphus* (one species), *Dipsadoboa* (one species).

2. Snakes with affinities to the African fauna:—*Mimophis* (one species), *Pelophilus* (one species).

3. Snakes with affinities to the Indian fauna:—*Ptyas* (one species), *Langaha* (one species).

4. Snakes with affinities to the South-American fauna:—*Liophis* (one species), *Tachymenis* (one species), *Pseudocoryphus* (two species), *Heterodon* (two species), *Dromicus* (one species), *Herpetodryas* (one species), *Philodryas* (one species), *Dipsas* (two species), *Xiphosoma* (one species).

Rela-
tions of
Africa to
India.
Africa shows affinities to all the three other equatorial regions, but chiefly to the Indian. No sharply defined boundary exists between the two regions, the intervening parts of Asia being inhabited by a desert fauna which penetrates into districts of similar nature in Africa as well as in India. Certain genera and species belonging to this desert fauna are therefore common to both regions. But there are, besides, other points of affinity of deeper significance, such as the development in both of a distinct Trionycoid genus, besides the typical *Trionyx*, the general distribution of Agamoids and *Varanidæ*,¹ the presence of the remarkable family of Lycodonts, which do not occur anywhere else, of the large forms of *Python* with concomitant absence of Booids, and of the *Elapidæ*, of which one genus (*Naja*) extends from the west coast of Africa to Borneo. But these resemblances are fully counterbalanced by great differences in other portions of the Reptilian fauna: the Indian Emydoids are replaced by *Chelydridæ* in Africa, a type which it has in common with Australia and South America, whereas India possesses no *Amphisbænidæ*, no *Chamæleons*.² With regard to Ophidians, the number of forms generally is greatly diminished in Africa, but the proportion of poisonous Snakes is doubled. The Pit Vipers of India are wholly absent, and are replaced by true Vipers. In the Indian region arboreal Agamoid Lizards prevail; in Africa the Snakes show a greater tendency towards a modification of the habitus and structure for arboreal life. The Freshwater Snakes and Colubers which are so numerous in India are much reduced in numbers in Africa, *Tropidonoti* being almost entirely absent.

Tropical
Pacific
region.
Che-
lonians.
3. *The Tropical Pacific Region*.—So far as Reptiles are concerned, Tasmania has to be included in this region. No *Trionyx* or *Emys* goes eastwards beyond Wallace's line. In fact, the Chelonian type disappears in the islands between this line and the Australian continent—with two exceptions. A species of *Testudo* (*T. forsteri*) occurs in, and is limited to, the island of Gilolo; and

¹ Both these Lacertilian families extend into the Australian region; in fact they replace the Iguanoids of the western hemisphere and Madagascar.

² With the single exception mentioned above.

Cuora amboinensis, the most common Tortoise of Malaya, occurs in many of the eastern islands, but it has probably been imported by man, and by the same means may be still extending its range. On the continent of Australia *Chelydridæ* only occur, viz., eight species of *Chelomys* and five of *Chelodina*. In Tasmania, again, Chelonians are absent.

Besides the common Indian *Crocodylus porosus*, which Crocodiles may be considered an immigrant into this region, one or two other species of the same genus inhabit the fresh waters of the truly tropical parts, and are peculiar to Australia.

The bulk of the Lacertilian fauna is composed of Skinks, Lacer-Geckos, Agamoids, and *Varanidæ*, with the addition of a small family which is peculiar to the region, the *Pygopodidæ*. A peculiar type, *Dibamus*, has been found in New Guinea; and, finally, a single Iguanoid, *Brachylophus*, is common in the Fiji Islands; how it came there, or how it survived its severance from the American stock, is a mystery. The Skinks are in this region more highly developed and more specialized than in any other part of the world; they exceed in numbers the Geckos, which generally accompany the Skinks in their range over the smaller islands of the Pacific; in these islands members of these two families represent the whole of the Lacertilian fauna. The Australian Agamoids are chiefly peculiar and partly much differentiated forms, but some have distinct affinities to, or are even identical with, Indian genera. The *Varanidæ* are also closely allied to Indian species.

The total number of Snakes amount to ninety species, Ophi- of which twelve are *Typhlops*, eight other innocuous dians. Colubrine, fifty *Elapidæ*, one *Erycine*, fourteen *Pythonidæ*, and five *Boidæ*. The number of poisonous Snakes, therefore, exceeds that of innocuous, a proportion quite unparalleled in any other part of the world. The few innocuous Colubrine Snakes belong to Indian genera, and evidently have spread from that region; but all the genera of *Elapidæ* (twelve), *Erycidæ* (one), *Pythonidæ* (five), and *Boidæ* (three) are peculiar to this region.

In Australia we meet, therefore, with the interesting fact that, whilst it is closely allied to South America, but totally distinct from India, by its Chelonians, its Lizards and Colubrine Snakes connect it with this latter region. With regard to the other Ophidians, they, although peculiar genera, have their nearest allies partly in India partly in South America; and the character of the Australian Snake fauna consists chiefly in its peculiar composition, differing thereby more from the other equatorial regions than these do among themselves. Wallace's line marks the boundary between India and Australia only as far as Chelonians are concerned, but it is quite effaced by the distribution of Lizards and Snakes. Thus in New Guinea Lizards of the Indian region are mixed with *Pygopodidæ*, and an island as far east as Timorlaut is inhabited by six Snakes, three of which are peculiarly Indian, whilst the other three are as decidedly Australian. The islands north of New Guinea and of Melanesia are not yet occupied by the Ophidian type, and only species of *Enygrus* have penetrated eastwards as far as the Low Archipelago, whilst the Fiji Islands and the larger islands of Melanesia have sufficiently long been raised above the level of the sea to develop quite peculiar genera of Snakes. Tasmania is tenanted by poisonous Snakes only.

4. *The Tropical American Region*.—An examination of the distribution of Chelonians in the New World leads to a different division of its regions from that of the other Reptiles. Central America and the West Indies, with regard to Chelonians, cannot be united with the Southern

continent. The Chelonians of South America proper are the following (forty-three species):—

Testudo,	with 8 species	8
Emys,	" 4 "	6
Cinosternum,	" 2 "	
Peltocephalus,	" 1 "	29
Podocnemis,	" 5 "	
Platemys,	" 17 "	
Hydromedusa,	" 5 "	
Chelys,	" 1 "	

The *Chelydridæ* thus predominate to the exclusion of the *Emydridæ*. They belong to five distinct genera, of which one, *Chelys*, is the most specialized of the family. They do not extend to the western side of the Andes, and cease in the south with the system of the Plate River. Northwards they penetrate to Trinidad, but become scarcer in the degree in which their place is occupied by the *Emydridæ*, which have spread from Central America over the northern parts of this region. One, *Emys d'orbignii*, following the course of the Uruguay, has penetrated southwards to the mouth of the Plate River.

Land Tortoises (*Testudo*) are at the present day almost extinct in this region, two species only (*Testudo tabulata* or *carbonaria* and *T. argentina*) being found on the continent of South America. The six other species belong to the Oceanic Island Tortoises of gigantic size, and inhabit or inhabited the Galapagos group.

Trionyx is entirely absent.

Crocodylians. The Crocodilian order is more developed in this region than in any other. Besides at least three species of *Crocodylus*, six Alligators occur. The former occupy Central America, with Mexico, the coast of Florida, the West Indies, Ecuador, and the system of the Orinoco; the latter extend much farther southwards, throughout the system of the Plate River, whilst in North America this genus is represented by a distinct species, *A. mississippiensis*.¹ Alligators found in some of the West Indian islands are believed to be immigrants from the continent.

Lacertilians. The Lacertilian fauna connects Central with South America,—all the six families found in the latter area, viz., *Geckonidæ*, *Anguidæ*, *Amphisbænidæ*, *Tegidæ*, *Iguanidæ*, and *Scincidæ*, being represented in Central America. But Central America possesses, besides, five other families, small in species and restricted in range (some belonging to the fauna of great elevations), but highly interesting types. These are the *Eublepharidæ*, *Xenosauridæ*, *Anelidæ*, *Helodermatidæ*, and *Lepidophymatidæ*. Their localization and differentiation can be accounted for on the hypothesis that they are the remains of the fauna of the various islands into which Central America was broken up at a former period.

By far the larger number of Lizards of the Tropical American region are *Iguanidæ*, a family which in the New World repeats the Old-World *Agamidæ*. They are spread over the whole of the region, having adapted themselves in their mode of life and structure to every variety of ground. One species (*Liolaemus magellanicus*) ranges to the Straits of Magellan. The largest Iguanoids inhabit the Galapagos Islands, where they live on the rocks of the shore, one species (*Oreocephalus cristatus*) entering seawater and feeding on sea-weeds. The next numerous family is the *Tegidæ*, the New-World representatives of the Old-World *Lacertidæ*; *Geckonidæ*, *Scincidæ*, *Amphisbænidæ*, and *Anguidæ* are less numerous, but have also a wide range over the region. The Lacertilian fauna of the West Indies is wholly South-American; it does not comprise any peculiar family, and only a few characteristic genera, of which *Anolis* is, perhaps, the most highly specialized and the one which is composed of the greatest number of species; this genus, however, is also well represented on the continent, especially in Central America.

Ophiidians. With regard to Ophiidians the Tropical American region approaches the Indian in the number of species, which amounts to about four hundred, but it exhibits a comparatively less variety of generic and peculiar forms; of the eighty genera only about fifty do not range beyond its limits. However, a boundary line which would separate the Ophiidian fauna of South America from that of the north does not exist. In Central America and

Mexico the generic types of the south and north are intermingled, and as the climate, in accordance with latitude and altitude, assumes a more temperate character the specifically tropical Snakes disappear and are in part replaced by those of North America. This mixture of the two faunæ and the great variety of physical conditions within a small area account for the relatively very large number of Snakes of Central America. About one hundred and fifty out of the four hundred species attributed to the whole region belong to this district. The West-Indian Ophiidians belong to the Tropical American fauna; many continental generic forms of the latter occur in the islands, and such genera as are peculiar to the West Indies do not exhibit a common feature, or are founded on slight characters. The exact limits to which Snakes extend southwards are not known; they seem to be very scarce on the southern confines of the Argentine Republic. Quite recently a Crotaline Snake, *Rhinocerocephalus*, has been discovered in eastern Patagonia.²

Of families peculiar to or highly characteristic of this fauna we can mention one only, viz., the small family *Scytalidæ*, which replaces the Lycodonts of the Old World. The *Boiidæ* are likewise a prominent feature, although not exclusively confined to South America; of eleven genera eight are Tropical American, and three Australian. The true Boas include the most gigantic of Snakes, and replace the Old-World Pythons.

In this fauna a peculiar and highly ornamental pattern of coloration, which consists of more or less regularly alternate rings of black, red, and yellow, seems to be the more worthy of notice, as it occurs in very distinct families, viz., the *Calamariidæ*, *Coronellidæ*, *Natricidæ*, *Leptognathidæ*, *Scytalidæ*, *Tortricidæ*, *Elapidæ*.

Of *Typhlopodæ* more than twenty species have been described, and, besides, the *Stenostomatidæ* are represented by seven species.

Of *Tortricidæ* one species occurs.

The *Calamariidæ* are represented by thirteen genera, of which ten are peculiar. The most characteristic and geographically important are *Elapomorphus* with ten, *Hamalocercum* with sixteen, *Ninia* with four species. The Indian genus *Geophis* is represented in Tropical America by twenty-five species.

Coronellidæ are extremely numerous (sixty-six species referable to thirteen genera). Of these *Xenodon* with twelve species, *Liochis* with sixteen, *Erythrolamprus*, and *Phocercus* deserve special mention.

Of Colubers forms with elongate compressed body, approaching arboreal forms (*Spilotes*), are not scarce.

Freshwater Snakes are not abundant, but a genus peculiar to the region, *Helicops*, occurs in eight species. *Tropidonotus* might be regarded as absent, but for three or four species which occur north of the Isthmus of Panama and in the West Indies; also the allied genus *Tretanorhinus* is confined to Central America and the West Indies.

Tree Snakes are extremely abundant—some seventy species referable to six genera, of which *Dromicus*, *Philodryas*, and *Herpetodryas* are very characteristic forms. Of *Ahaetulla* some seventeen species are known.

Of *Dipsas* and allied genera only four species occur, but of the peculiarly South-American *Leptognathidæ* some twenty-five species have been distinguished.

In Central America there occur two extremely singular forms which, however, are imperfectly known and seem to be restricted to a very limited area. One, *Loxocemus*, is considered a representative of the family *Pythonidæ*, and the other, *Notopsis*, is stated to be the type of a distinct family allied to the Indian *Xenodermidæ*.

Of the twenty species of *Boiidæ* the West Indian contingent amounts to no less than eight or nine, a fact which clearly demonstrates the pertinence of the West Indies to this region.

Erycidæ are absent.

Poisonous Snakes are numerous, the proportion to innocuous Snakes being as 1 : 8. Besides the singular occurrence in Venezuela of a member of the *Atractaspididæ*, *Dinodipsas*, the Colubiform poisonous Snakes are represented by one genus only, *Elaps*, which, however, shows numerous varieties or species, and is extremely common and widely spread over the region. *Viperidæ* are absent; but the largest forms of Pit Vipers (*Crotalidæ*) are developed in this

¹ We may mention here, in anticipation, that a species of Alligator has recently been discovered in China.

² There is reason to believe that *Euophrys*, which has been placed among the *Psammophidæ*, is likewise a Patagonian form.

region, and represented by five genera, which, if not peculiar to Tropical America, are at least confined to the New World, like *Cenchrus* and *Crotalus*.

Relations
of South
America
to other
regions.

The Reptilian fauna of tropical America thus shows relations to the other equatorial regions in three of its constituent parts only, viz., in the *Chelydridæ*, *Amphisbænidæ*, and *Crotalidæ*. It has the former type in common with Africa and Australia; but, whilst the presence of *Trionyx* on the African continent forms an important distinctive feature, the resemblance of South America to Madagascar is as great as, or even greater than, that to Australia, which lacks *Testudo*.

On the other hand the Lacertilian fauna is essentially distinct from that of the Old World, with the exception of *Amphisbænidæ* (and of species of *Eublepharidæ*), whose presence in South America and Africa is a most remarkable fact, and very strong evidence of the former existence of intervening land. The Skinks and Geckos, which are generally distributed over the warmer parts of the globe, cannot come into consideration.

The Snakes of Tropical America differ also much more from those of the Old-World regions than certain other portions of its fauna, as, for instance, its Batrachians and Freshwater Fishes. A distinct affinity with India is expressed only by the development of the family of Pit Vipers,—the presence in both regions of numerous Tree Snakes, of species of the genus *Geophis*, of the family *Tortricidæ*, &c., being less significant points of resemblance. But these resemblances are more than counterbalanced by the absence in South America of Lycodonts, *Tropidonoti*, *Pythonidæ*, *Erycidæ*. The African Ophidian fauna¹ is still further removed by *Crotalidæ* being entirely wanting and replaced by *Viperidæ*; only a few genera, like *Stenostoma*, *Coronella*, *Leptodira*, *Dipsas*, *Ahetulla*, are examples in which species are found in both regions. In both *Tropidonotus* is almost absent.

As all the innocuous Colubrine Snakes of Australia are derived from the Indian region, they form no part in a comparison between the Australian and South-American faunæ. Of the other Ophidian types these regions have not a single genus in common, nor a family which would not be represented also either in Africa or India or both.

5. *The North-American Region*.—While the Chelonians of the North-American or Nearctic region (in which, so far as this Reptilian order is concerned, Central America and the West Indies have to be included) are essentially different from those of South America, the Lizards and Snakes of both belong to the same family types, and pass in an unbroken series from the northern to the southern parts of the New World.

In this region the *Emydidæ* have attained to as great a development as in the Indian, and are associated with a few representatives of *Testudo* and *Trionyx*. The species, which are altogether about fifty in number, and of which a few are common to the Central-American and North-American sections, are distributed as follows:—

	Central America, including Mexico.	N. America. ²
<i>Testudo</i>	0	1
<i>Cistudo</i>	1	1
<i>Clemmys</i>	13	10
<i>Dermatemys</i>	1	0
<i>Macrocllemmys</i>	0	1
<i>Chelydra</i>	2	1
<i>Staurotypus</i>	3	0
<i>Aromochelys</i>	0	2
<i>Cinosternum</i>	10	3
<i>Trionyx</i>	0	2
	30	21

¹ Of the relations existing between the Snakes of South America and Madagascar we have spoken above, p. 469.

² In a *Check-list* published by the U.S. National Museum in 1883

It may be seen from this list that no Chelydoid passes northward beyond the Isthmus of Panama; the Chelonians of Central America belong exclusively to the *Emydidæ*, which are represented by some thirty species; the majority do not extend either into South or North America; two of the genera, *Dermatemys* and *Staurotypus* are peculiar to it, and *Cinosternum* has its headquarters in this section. Neither *Trionyx* nor *Testudo* occurs. Proceeding beyond the Mexican boundary, we find still the *Emydidæ* predominating, a few of the species of Central America ranging northwards into the United States; distinct species of *Clemmys*,³ *Cinosternum*, *Chelydra*, &c., appear, with the wonderful genus *Macrocllemmys*. An instance of the isolated occurrence of a *Testudo* (*T. polyphemus*) is met with here; and from the lower part of the Mississippi northward one of the most characteristic features of the North-American fauna makes its appearance, viz., two species of *Trionyx*, of which one at least follows the ramifications of that river northward and has found its way into Lake Winnipeg (51° N. lat.). West of the Rocky Mountains Tortoises are scarce and of distinct species.

In the West Indies the following species have been found:—1, *Testudo tabulata*; 2, *Podocnemis dumeriliana*; 3, *Emys concinna*; 4, *E. decussata*; 5, *E. rugosa*. Of these the first two are identical with South-American, and the third with a North-American species, and, therefore, may be regarded as strangers which in comparatively recent times have been introduced into the West Indies. On the other hand the last two are species peculiar to the islands, and, as they belong to a North-American generic type, clearly prove the pertinence of this island district to the northern continent, so far as Tortoises are concerned.

The south-eastern parts of North America are inhabited Crocodiles by an Alligator which is specifically distinct and locally dilians. separated from the southern species.

The tropical Lacertilian and Ophidian faunæ gradually Lacer-merge into that of the temperate north, and any boundary tilians and Ophi-dians. line drawn between the north and south is more or less arbitrary. As a matter of fact so many truly tropical forms advance north of the tropic of Cancer (which by many authors is taken as the boundary line) that we are inclined to restrict the limits of this region to the district about the Rio Grande, whilst, on the other hand, the northern fauna extends to a lower latitude on the plateau of Mexico. Thus restricted, the North-American fauna includes about fifty species of Lizards, belonging to genera which with very few exceptions are already represented in Central America, or even farther southwards. By far the greatest number are *Iguanidæ*; the *Scincidæ*, *Anigidæ*, and *Tejidæ* are represented by several, the *Geckonidæ* by fewer species, whilst single species occur of the *Amphisbænidæ*, *Anellidæ*, *Lepidophymidæ*, and *Helodermatidæ*,—all Central-American types. In fact, North America does not possess one family of Lizards peculiar to it.

It is worthy of notice that Lizards do not extend so far northwards in the western as in the eastern hemisphere; one species (*Gerrhonotus caruleus*) ranges into British Columbia, another into Minnesota (*Eumeces septentrionalis*), and a third into Massachusetts (*Eumeces fasciatus*).

Of Snakes about one hundred⁴ species could be enumerated, with a proportion of 1:14 of poisonous to innocuous Snakes. All the families represented in this fauna occur also in tropical America, and there is a great agreement of the genera with those of the Central-American district, so that less than one-half can be considered as peculiar to this region, viz., *Conocephalus*, *Carrhopis*, *Contia*, *Cemophora*, *Hypsiglena*, *Chersodromus*, *Rhinoclitus*, *Pituophis*, *Ichnognathus*, *Charina*, *Wenona*, *Lichanura*. *Calamariidæ* and

a much larger number of "North-American" terrestrial Chelonians is given, viz., forty-three. This is partly due to the southern boundary of "North America" being extended to the tropic of Cancer, partly to the fact that species are admitted in a different sense from those of the herpetologists of the Old World. By adopting these species a very erroneous impression would be created as regards the comparative numbers of the groups in the several regions. That check-list includes three species of *Testudo*, three of *Cistudo*, twenty-one of *Emys* and its subgenera, five of *Cinosternum*, two of *Aromochelys*, one each of *Macrocllemmys* and *Chelydra*, and six of *Trionyx*.

³ *Emys blandingii* may be erased from the list of species; we have recently examined a specimen; it is identical with *Emys lutaria*, and has evidently been introduced from Europe.

⁴ One hundred and eighty, according to some authors, who include a great part of Mexico, and adopt every variation to which a binomial term has been applied.

Coronellidæ are numerous; so are Colubers, of which *Pituophis* is the most characteristic. Freshwater Snakes abound, especially of the genus *Tropidonotus*. Of *Tortricidæ* three genera have been distinguished. No true Vipers occur, but Pit Vipers are represented by three genera, of which two are Rattlesnakes.

After what has been stated already, the affinities of this to other regions can be summed up in a few words. The Reptilian fauna of North and South America forms, with the exception of the Chelonians, a homogeneous whole by which the Neogean division proposed by Sclater for Passerine Birds is well characterized. On the other hand, the Chelonian fauna of North America is entirely distinct from that of South America, and most closely allied to that of India.

Europeo-
Asiatic
region.

6. *The Europeo-Asiatic Region.*—Whilst the north of the western hemisphere has at least one order of Reptiles, the Chelonians, by which it is distinguished from the south, the temperate region of the eastern hemisphere possesses no important distinguishing type of Reptile. Its Reptilian fauna is merely an offshoot of those of the two adjoining tropical regions; and, if we were to add the genera most characteristic of the Palearctic fauna to either Africa or India, the character of neither would be modified or changed. Thus, so far as Reptiles are concerned, a Palearctic region does not deserve to rank with the other primary regions.

Chelonians.

The Chelonians are represented by nine species only, viz. :—

Testudo,	4 species
Emys,	3 „
Trionyx,	2 „

—types which are only specifically distinct from those of the two southern tropical regions. The Land Tortoises are confined to the warmer districts of the western portion, penetrating into the centre of the Siberian sub-region, and entirely absent in the northern and eastern parts; of *Emys* one species (*E. lutaria*) is still found in north-eastern Germany as far north as 54° N. lat.¹; and probably some other species will be found in similar latitudes in the little explored Amur country, where also a species of *Trionyx* (*T. maackii*) occurs. The second species of this latter genus which is referable to this region inhabits the Euphrates and Tigris.

Crocodylians.

The recent discovery of an Alligator in central China is a highly interesting fact, but not surprising, when we remember the occurrence in China of not a few North-American types of Batrachians and Freshwater Fishes. The common African Crocodile still lingers in the Mediterranean district,—its presence in Syria having been placed beyond doubt, and its occurrence in Sicily having been asserted on very good authority.

Lacertilians.

The Lacertilians include the only family type which this region has not derived from either Africa or India, viz., the *Anguidæ*. Two genera of this family, *Anguis* and *Pseudopus*,² are widely spread in Europe, and closely allied, the former to the South-American *Ophiodon*, and the latter to the North-American *Ophisaurus*. *Lacertidæ* are abundant as in Africa, and *Amphisbænidæ* and *Chamaeleontidæ* represented at least in the Mediterranean district. Towards the central parts of Asia the terrestrial *Agamidæ* are continued from north-western Africa, partly with but slight modifications, *Phrynocephalus* being a specifically Central-Asiatic genus. In the Manchurian sub-region these African types are replaced by some Indian forms, such as *Gecko* and *Tachydromus*. The northern range of Lizards in this region extends as far as Lapland (*Lacerta vivipara* and *Anguis fragilis*).

Ophidians.

The most characteristic Ophidian genus of the region is *Zamenis*, a Colubrine form which is very widely spread, and includes more species (eleven) than any other Palearctic genus. This genus extends over Arabia, and even into the island of Socotra, without being associated there so far as is known at present with Snakes of an either peculiarly African or Indian type. The total number of Palearctic Snakes amounts to sixty, of which twelve are poisonous Snakes, viz., nine Viperines and three *Halys*. The majority inhabit the Mediterranean district and western Asia.

Four *Typhlops* and a single *Stenostoma* have been found in the Mediterranean district and Persia.

Of the small number of *Calamariidæ* and *Coronellidæ*, *Rhyncho-*

calamus, *Psilosoma*, *Lytorhynchus*, and *Ditypophis* (Socotra) are genera not found beyond this region.

Colubridæ are comparatively numerous, and show less affinity to African than Indian forms. Besides *Zamenis*, *Coluber* and *Elaphis* occur in four species each, and *Rhinechis* and *Acontiphis* (Afghanistan) are peculiar genera.

Three or four species of *Tropidonotus* represent the groups of Freshwater Snakes.

The *Psammophidæ* are well developed; besides two species of *Psammophis*, *Taphrometopon* and *Celopeltis* are peculiar genera, but not extending into eastern Asia.

There is one species of *Eryx*.

One species of *Naja* reaches the Caspian.

The three species of *Halys* are Central-Asiatic.³

Of the nine species of Viperines six belong to *Vipera* and *Cerastes*. *Daboia* and *Echis* may be considered to have their headquarters in this region, but they extend into southern India, and *Echis* has spread east and west along the barren plains or deserts of North Africa and north-western India.

7. *New Zealand.*—The southernmost parts of South New America, Africa, and Australia are not inhabited by a Zealand sufficiently differentiated fauna to be separated from the tropical regions of which they are the continuation. None of the small oceanic islands south of 40° or Tierra del Fuego possess any Reptiles. On the other hand New Zealand is by the possession of *Hatteria*, the sole living remnant of the extinct order *Rhynchocephalia* (not to mention other scarcely less important parts of its fauna), so much distinguished from the other regions that it cannot be associated with any of them. Although the climate and other physical conditions seem to be well adapted for the existence of the Chelonian and Ophidian types, neither is represented; and of Lizards only representatives of the ubiquitous Skinks and Geckos have reached its shores; but some of the latter must have inhabited New Zealand for a long period, as they belong to a distinct genus, *Naruttinus*, which is peculiar to this group of islands.

At the conclusion of this section it will be useful first to recapitulate the principal features of the Reptilian faunæ for each of the primary regions into which the land of the globe has been divided by zoologists, and which nearly coincide with the geographical divisions, and secondly to arrange the regions according to the natural relations as expressed by this class of animals. A division into zones comprising the corresponding parts of both hemispheres cannot be maintained for Reptiles, since the greater portion of the faunæ of the temperate are merely the offshoots of tropical faunæ, no peculiar types of a higher than generic rank being developed in them.

1. The INDIAN REGION is characterized by *Trionycidæ* and *Emydidæ*, but few *Testudinidæ*. *Crocodylidæ*, with Gavials. Lacertilians and Ophidians very numerous. *Agamidæ* chiefly arboreal (*Draco*), and *Varanidæ*. *Pythonidæ* and *Lycodontidæ*. Ground Snakes, Colubers, Tree Snakes, and Freshwater Snakes abundant in genera. *Tropidonotus*. Poisonous Snakes in the proportion of species as 1:10, and comprising *Crotalidæ* and *Elapidæ*, but only two *Viperidæ*.

2. The AFRICAN REGION (exclusive of Madagascar) is characterized by Land Tortoises, *Trionycidæ*, and *Chelydidæ*. Species of *Crocodylus* only. Lacertilians and Ophidians rather numerous. *Agamidæ* chiefly terrestrial; *Lacertidæ* and *Varanidæ* are well represented. *Amphisbænidæ*, *Gerrhosauridæ*, and *Zonuridæ* are peculiar to the region. *Chamaeleontidæ*. *Pythonidæ* and *Lycodontidæ*. True Colubers and *Tropidonotus* almost absent. *Psammophidæ*. Poisonous Snakes in the proportion of 1:5, comprising *Viperidæ* and numerous venomous Colubrines.

3. The EUROPO-ASIATIC REGION is composed of a mixture of Indian and African generic and family types; and only a few peculiar genera have their centre of distribution in this part, such as *Anguis*, *Pseudopus*, *Phrynocephalus*, *Uromastix*, *Stenodactylus*, *Alsophyllax*, *Ceramodactylus*, *Scincus*, *Zamenis*, *Celopeltis*, *Taphrometopon*, *Daboia*, *Echis*, *Halys*. The majority inhabit the sub-tropical and warmer parts abutting upon the neighbouring tropical regions and are rapidly reduced in number in the more temperate portion.

4. The TROPICAL PACIFIC REGION possesses one of the terrestrial Chelonian types, *Chelydidæ*, and species of *Crocodylus* only.

¹ *Emys lutaria* is one of the Tortoises the range of which has become much restricted in post-Glacial times, its remains having been found in peat beds in Norfolk, Belgium, Denmark, and Sweden, where it is now completely extinct.

² The isolated occurrence of a species of *Pseudopus* in Khassia has been mentioned above.

³ Viperine and Crotaline Snakes meet in the centre of the Siberian sub-region (Peters, *Monatsber. Berl. Ak.*, 1877, p. 736).

Besides Skinks and Geckos, terrestrial *Agamidæ* and *Varanidæ* are well represented; *Pygopodidæ*, *Erycidæ*, *Pythonidæ*, and *Boidæ* are autochthonous, whilst a small number of innocuous Colubridæ are immigrants from the East Indies. The poisonous Snakes surpass in number the non-poisonous, and belong to the *Elapidæ*.

5. MADAGASCAR possesses *Chelydridæ* and *Testudinidæ* without *Trionyx*, like South America. A species of Crocodile, *Chamæleonidæ* more differentiated here than in Africa, with which it has also *Gerrhosauridæ* and *Zonuridæ* in common; *Agamidæ* are replaced by the South-American *Iguanidæ*. Snakes chiefly South-American; no poisonous Snake.

6. THE TROPICAL AMERICAN REGION is characterized by the full development of *Testudinidæ* and *Chelydridæ* and absence of *Trionyx*; Emydoids are immigrants from the north. Crocodiles and Alligators. Lacertilians numerous in families and species, the majority being *Iguanidæ*; the Old-World *Lacertidæ* replaced by *Tejidæ*. Other families, *Anguidæ*, *Amphisbænidæ*, *Eublepharidæ*, *Helodermatidæ*, &c., well represented. Snakes numerous: *Boidæ* and *Scytalidæ*; Ground Snakes, Colubers, and Tree Snakes abundant, less so Freshwater Snakes; *Tropidonotus* almost absent. Poisonous Snakes in the proportion of species as 1 : 8, and comprising *Crotalidæ* and *Elaps*.

7. THE NORTH-AMERICAN REGION differs from the Tropical in possessing the *Emydridæ* in their full development and *Trionyx*; only one *Testudo*. One Alligator. As regards Lacertilians and Ophidians this region occupies the same relation to tropical South America as the Palearctic region does to Africa and India.

8. NEW ZEALAND is characterized by the possession of the Rhynchocephalian type, without any other Reptile with the exception of certain Skinks and Geckos.

Relations of fauna —as to Chelonians; Arranging these primary divisions of the globe in accordance with the distribution of the several orders of Reptiles, we find that with regard to CHELONIANs the regions stand in the following relation to each other:—

- I. Emydridæ fully developed.
 - A. Trionycidæ fully developed.
 1. Testudinidæ in small numbers or immigrants: a. *Indian-Palearctic* regions, and b. *North-American* region (including Central America).
- II. Chelydridæ fully developed.
 - A. Trionycidæ fully developed.
 1. Testudinidæ fully developed: *African* region.
 - B. Trionycidæ absent.
 1. Testudinidæ fully developed: a. *Tropical American* region, and b. *Madagascar*.
 2. Testudinidæ absent: *Tropical Pacific* region
- III. Chelonians entirely absent: *New Zealand*.

as to Lacertilians; The types of CROCODYLIAN and RHYNCHOCEPHALIAN orders are too few in number and either very widely or very locally distributed, so that no general division of the globe's surface can be based upon them alone.

The two large LACERTILIAN families *Geckonidæ* and *Scincidæ* are generally distributed over the warmer parts of the globe, and therefore not well adapted for the distinc-

tion of the primary regions. Nevertheless, in a more detailed account many of the genera would have to come into consideration, being confined to more or less limited areas. Both families are represented in great variety in Australia, but scantily in South America. With regard to other families the regions can be arranged thus:—

- I. Agamidæ and Varanidæ fully developed.
 - A. Chamæleonidæ, Lacertidæ, and Amphisbænidæ: *African* region (including as sub-region the Western Palearctic portion, characterized by Anguidæ).
 - B. Amphisbænidæ and Chamæleons (except one species) absent; Lacertidæ few: *Indian* region with Manchurian sub-region.
 - C. Pygopodidæ: *Tropical Pacific* region.
- II. Iguanidæ fully developed.
 - A. Chamæleonidæ: *Madagascar*.
 - B. Tejidæ, Amphisbænidæ, and Anguidæ: *South-American* and *North-American* regions.
- III. Skinks and Geckos only: *New Zealand*.

Of the families of OPHIDIANS the *Pythonidæ* and as to *Boidæ*, the *Crotalidæ* and *Viperidæ*, the *Lycodontidæ* and *Ophidians*, *Scytalidæ* replace each other in their distribution, and are, therefore, best adapted for determining the relations of the zoological regions. Although the first two are so far as we know at present the geologically oldest types, and therefore might be employed in the first instance in the arrangement of the regions, their distribution is limited to the equatorial zone, and fails to show the close relations existing between the temperate and equatorial parts of the Old World on the one hand and those of the New on the other. The relations of Madagascar to Tropical America are in the following scheme less distinctly expressed than they are in nature.

- I. Viperidæ fully developed.
 - A. Pythonidæ and Lycodontidæ: *African* region.
 - B. Tropidonoti and true Colubers: western portion of the *Euro-Asiatic* region.
- II. Crotalidæ fully developed.
 - A. Pythonidæ and Lycodontidæ in the tropical parts; Tropidonoti and true Colubers; none of the Crotalines with rattles: *Indian* region (including Manchuria).
 - B. Tropidonoti and true Colubers; some of the Crotalines with rattles; intermediate between the Manchurian sub-region and tropical America: *North-American* region.
 - C. Boidæ and Scytalidæ: *Tropical-American* region
- III. Colubrine venomous Snakes only.
 - A. Pythonidæ and Boidæ: *Tropical Pacific* region.
- IV. Venomous Snakes entirely absent.
 - A. Boidæ: *Madagascar*.
- V. Snakes entirely absent: *New Zealand*. (A. C. G.)

REQUENA, a town of Spain, in the province of Valencia, 41 miles to the west of that city on the road to Cuenca, occupies a strong position near the river Oleana in the rocky mountainous district called Las Cabrillas separating Valencia from Castile. It is commanded by a castle, and still has traces of the walls that anciently encircled it. The tower of the church of San Salvador is the only other feature of architectural interest. The principal industries are those connected with the culture of grain, fruit, wine, saffron, and silk. The population of the municipality in 1877 was 13,527.

RESERVOIR. See WATERWORKS.

RESHAL, i.e., RABBENU SHELOMOH LORIA (or Luria, vulgo Lurye), was one of the famous "Five¹ Sages" (Rabbis) of the 16th century. His father's name was

¹ The other four were—(1) R. Moshe Isserls of Cracow (the celebrated "Rema"); (2) R. Lewa b. Besaleel (the great Halakhist and Cabbalist), chief rabbi of Prague; (3) R. Mordekhai Yaphe (the author of the *Lebushim*), chief rabbi of Posen, &c.; and (4), last but not least, R. Yoseph Caro, principal of the academy of Safed in Palestine, and compiler of the normative *Shulhan 'Arukh*.

R. Yehiel of Ostroff (S. W. Russia), a descendant of RASHI² (q.v.). He is also known under the name of Rashal, or Maharshal (i.e., Morenu Harab R. Shelomoh Loria). He himself was chief rabbi of Lublin, where he died in 1573. His works are of importance on account of the numerous, though only incidental, notices they contain in connexion with the history of Jewish literature. We name six of these works—one edition of each:—

- (1) *Hokhmah Shelomoh*, discussions on the Babylonian Talmud, Rashi, the Tosaphoth, &c. This work is now an integral part of the Talmud editions. (2) *Yam shel Shelomoh*:—(a) on Yomtob (or Besah), Lublin, 1636, and reprints; (b) on Yebamoth, Altona, 1739; (c) on Kethuboth (first four perakim), Stettin, 1862; (d) on Kiddushin, Berlin, 1766; (e) on Gittin, Berlin, 1761, and reprint; (f) on Bobo Kammo, Prague, 1616, and reprint; (g) on Hullin, Cracow, 1646, and reprints. All these are in folio. (3) *Yeri'oth Shelomoh*, supercommentary on Rashi on the Pentateuch, with special reference to Mizrahi's supercommentary, Prague, 1608, 4to. (4) *Atereth Shelomoh*, on the *Illicita et Licita* of R. Yishak of Düren, Basel, 1599, and reprint, folio. (5) *Ammude Shelomoh*, on the *Sepher Hachmishvot* of R. Moshe of Coucy, Basel, 1599, 4to. (6) *Responsa*, Lublin, 1574, 4to, and reprints in folio. (S. M. S.—S.)

² *Yam shel Shelomoh*, on Yebamoth, iv. 33.

RESHD. See RASHT.

RESINA, a town of Italy, 6 miles south-east of Naples and practically a southern continuation of Portici, is well known as the usual starting place for tourists on their way up Vesuvius, and as the nearest town to the buried city of Herculaneum. It had 13,626 inhabitants in 1881 (commune 15,593).

RESINS. A resin is a secretion formed in special resin canals or passages of plants, from many of which, such as, for example, coniferous trees, it exudes in soft tears hardening into solid masses in the air. Otherwise it may be obtained by making incisions in the bark or wood of the secreting plant. Resin can also be extracted from almost all plants by treatment of the tissue with alcohol, and it is formed by the oxidation of essential oils, many authorities being of opinion that all true resins, which are in chemical composition oxidized hydrocarbons, result primarily from the action of oxygen on essential oils. Resinous substances are further produced by the dry distillation of numerous organic compounds and by the drying of fatty drying oils. Certain resins are obtained in a fossilized condition, amber being the most notable instance of this class, and African copal and the kaurie gum of New Zealand are also procured in a semi-fossil condition. The resins which are obtained as natural exudations are in general compound bodies containing more than one simple resin and varying proportions of essential oil. These compounds when soft are known as oleo-resins, and when imperfectly fluid they are called balsams. Other resinous products are in their natural condition mixed with gum or mucilaginous substances and known as gum-resins. Varying in constitution as these bodies do, they also differ widely in physical properties; but the general conception of a resin is a noncrystalline body, insoluble in water, mostly soluble in alcohol, essential oils, ether, and hot fatty oils, combining with alkalies to form resin soap, softening and melting under the influence of heat, not capable of sublimation, and burning with a bright but smoky flame. A typical resin is a transparent or translucent mass, with a vitreous fracture and a faintly yellow or brown colour, inodorous or having only a slight turpentine odour and taste. Many compound resins, however, from their admixture with essential oils, are possessed of distinct and characteristic odours. A series of gradations among resins may be traced from the hard glassy transparent copals through soft elemis and oleo-resins, semi-fluid balsams and fluid wood oils, to the most limpid essential oils. The hard transparent resins are principally used for varnishes

and cement, while the softer odoriferous oleo-resins and gum-resins containing essential oils are more largely used for pharmaceutical purposes and incense. No systematic classification of resins has yet been attempted, and there is much uncertainty as to the botanical source of some well-known commercial varieties, while the chemical constitution and relations of many still require elucidation. The following list embraces the principal resins of commerce, and particulars regarding the more important of these will be found under their respective headings. See also ROSIN, GUM, and BALSAM.

I. *Copalline or Varnish Resins*:—African Copal or Gum Animé (see COPAL, vol. vi. p. 342); Mexican Copal, from *Hymenaea* sp.; Brazilian Copal, from *Hymenaea* sp. and *Trachylobium Martianum*; Piney Resin, or White Dammar, *Vateria indica* and *V. acuminata*; Sal Dammar, *Shorea robusta* and other species; Dammar of *Hopea robusta*; Black Dammar, from *Canarium strictum*; Mastic, *Pistacia Lentiscus* (vol. xv. p. 621); Lac (vol. xiv. p. 181); East Indian Dammar (see DAMMAR, vol. vi. p. 795); Kaurie or Coudie Resin, *Dammara australis* (see TURPENTINE); Sandarach, from *Callitris quadrivalvis* (see SANDARACH); Dragon's Blood (vol. vii. p. 389).

II. *Soft or Oleo-Resins*:—Manila Elemi, from *Canarium commune* (see ELEMI, vol. viii. p. 122); Mexican Elemi, *Amyris elemifera*; Brazilian Elemi, *Isica Icariba* and other sp.; Tacamahac (American), *Elaphrium tomentosum*; Tacamahac (East Indian), *Calophyllum Inophyllum*; Wood Oil, *Dipterocarpus turbinatus*; Chian Turpentine, *Pistacia Terebinthus*; Turpentine, Common Frankincense, and Thus from various *Coniferae* (see FRANKINCENSE, TURPENTINE, and ROSIN); Balsam of Canada, *Abies canadensis* (see BALSAM).

III. *Fragrant Oleo-Resins and Gum-Resins*:—Myrrh, *Balsamodendron Myrrha* (vol. xvii. p. 121); Bdellium or Googul, *Balsamodendron Roeburghii*; Balsam of Gilead or Mecca Balsam, *Balsamodendron Berryi*; Olibanum or Frankincense, *Boswellia Carteri*, &c. (see FRANKINCENSE, vol. ix. p. 709); Benzoin, *Styrax Benzoin* and *Balsamodendron Mukul* (vol. iii. p. 581); Solid Styrax, *Styrax officinalis* (see STORAX); Liquid Storax, *Liquidambar orientalis* (see STORAX); Balsam of Peru, *Myrospermum peruvianum* (see BALSAM); Balsam of Tolu, *Myrospermum toluiferum*; Labdanum or Ladanum, *Cistus creticus*, var. *labdaniferus*.

IV. *Fetid Gum Resins*:—Ammoniacum, *Dorema ammoniacum* (vol. i. p. 742); Asafoetida, *Ferula Narthex* and *F. Scorodisma* (vol. ii. p. 675); Galbanum, *Ferula galbaniflua* and *F. rubricaulis* (vol. x. p. 22); Opoponax, *Opoponax Chironium*; Sagapenum, *Ferula* sp.; Sarcocool.

V. *Medicinal Resins*:—Gamboge, *Garcinia* sp. (vol. x. p. 60); Guaiacum, *Guaiacum officinale* (vol. xi. p. 230); Euphorbium, *Euphorbia resinifera*; Balsam of Copaiba, *Copaifera officinalis* (see BALSAM).

VI. *Extract Resins* form a class of products principally important from a medicinal point of view. They embrace Scammony from *Convolvulus Scammonia*, Jalap Resin from *Ipomea Jalapa*, Podophyllum Resin from *Podophyllum peltatum*, Churru from Indian Hemp (*Cannabis sativa*), Cube Resin from *Cubeba officinalis*; and many other medicinal products owe their virtues to resinous bodies present in them.

R E S P I R A T I O N

THE continued existence of an amœba in a pool of water, or of a white blood-cell in the *liquor sanguinis*, depends upon a continual interchange of substances between the organism and the surrounding medium. The substances in question pass from the medium into the organism in a certain chemical form; they pass from the organism into the surrounding medium with their chemical form modified. Regarding merely the initial and final stages of this reconstitution of chemical form, we may speak of it as being of the nature of an oxidation. This view does not profess to be comprehensive; nevertheless, it is true that the metabolic and anabolic processes of cells, taken as a whole, resemble combustion at least to this extent that oxygen and oxidizable carbon take part in them, and that carbon dioxide results from them. Partly as a matter of tradition, and partly as a matter of convenience, physiologists have described the introduction of oxygen into the

organism and the emission of carbon dioxide from it as the complemental portions of one process of *respiration*. Although such a combined consideration is not strictly philosophical, inasmuch as it leaves out of view the introduction of the carbon into the organism, yet it is extremely convenient because the two processes referred to do, in all classes of the animal kingdom from the highest to the lowest, involve the same organs and tissues in their performance. Respiration may therefore be defined as the aggregate of those processes which are concerned in the introduction of oxygen into the system and the escape of carbon dioxide from it.

Respiration in such an organism as an amœba is extremely simple. The medium surrounding it contains a practically unlimited supply of oxygen, and is so vast that the carbon dioxide put out into the medium is quickly removed from the neighbourhood of the organism. The

interchange of oxygen and carbon dioxide takes place at the surface of the organism, so far as we know, continuously. In the higher animals, constituted as they are of a vast number of structural units accurately packed together, each resembling more or less in its physiological instincts the unicellular amœba, respiration presents a much more intricate problem. The fine interstices which exist between the structural elements do indeed contain a small quantity of a fluid medium which serves the function of the water bathing the amœba; but the store of oxygen in the medium would speedily become exhausted, and the emitted carbon dioxide would quickly accumulate to a dangerous degree, if the medium were not continually restored to its original purity. This revival is effected by the circulating blood which is brought by its capillaries into the neighbourhood of the remotest cells of the body. But even the mass of the blood is small compared with that of the cells it nourishes; unless it be itself purified and restored in turn the interstitial juices which depend upon it for their purification must soon fail to support the respiration of the cells. Such restoration of the blood takes place in certain organs called lungs or gills, where the blood acquires a fresh store of oxygen and parts with its excess of carbon dioxide.

Respiration in the higher animals may therefore be divided into (1) internal respiration, or the interchange of oxygen and carbon dioxide between the cells of the body and the fluid drenching them, and (2) external respiration, or the gaseous interchange taking place in the special respiratory organs (lungs, gills). The first is really a part of NUTRITION (*q.v.*); the second, or respiration proper, is the subject of the present article.

It will be evident on reflection that the process of respiration naturally falls to be described under two divisions, the first of which is concerned with the *movements* of the chest in inspiration and expiration and the manner in which they are brought about, and the second with the *interchange of gases* which takes place between the blood and the air in the lungs.

THE MOVEMENTS OF RESPIRATION.

Structure of the Organs of Respiration.

In order to understand the movements it is necessary first to know the structure of the air passages and thorax.

Anatomy of the Air Passages.—The essential organs of respiration consist of an air tube called the *trachea*, communicating at its upper end with the mouth and bifurcating below into two *bronchi*, one on the right hand and one on the left. Each bronchus divides and subdivides, diminishing in calibre at every division until a diameter of about 1 mm. is attained; such a diminutive bronchial tube is called a *bronchiole*. Every bronchiole is a cylindrical tube which divides dichotomously and rapidly several times, and finally terminates in irregular *alveolar passages*. The sides of the alveolar passages, and of the subdividing bronchioles in less abundance, are studded with hemispherical dilatations called air cells or *alveoli*. The terminal portion of an alveolar passage, with its air cells, is sometimes spoken of as an *infundibulum*—a term we may wisely forget at once, since it points to a distinction where no essential difference exists. The alveoli cluster in great abundance about the alveolar passages, and, although we have spoken of them as hemispherical, they are in reality made polygonal by mutual compression. They are surrounded by connective tissue of a very elastic quality, which gives to their delicate walls a firm support, and is so disposed about them that all the alveoli derived from one bronchiole are more closely knit together than they are bound to those of a neighbouring bronchiole; hence we may speak of a bronchiole with the assemblage of its members as a *lobule*, a term of peculiar importance since it will be evident on reflection that each lobule contains all the essential parts of a lung—is in fact a lung in miniature. By connecting tissue the lobules are compacted to form lobes, of which two on the left side and three on the right go to make up the respective lungs.

The trachea and larger bronchi are composed of a series of superposed crescentic pieces or imperfect rings of hyaline cartilage which with a tough fibrous and elastic membrane form a tube; in the trachea the incomplete cartilage-rings are so placed that their hiatuses are at the back. In the bronchial tubes, especially the

smaller ones, the cartilages are fewer, and less regular in shape, being in fact mere nodules in the bronchial walls. In the bronchioles there is no cartilage. There is an external fibrous and elastic layer investing the trachea and bronchi; and stretching from tip to tip of the imperfect cartilaginous rings are bands of involuntary muscular fibres. The function of the cartilages is doubtless to maintain the patency of the primary air passages by resisting external compression; that of the muscular fibres is probably to resist unusual distension of the tubes, as in the strain of coughing, &c. The *mucous membrane* of the trachea consists of a *mucosa* of fine connective tissue, mixed with some tissue of the adenoid sort, and with elastic fibres, disposed in longitudinal bundles. Beneath the mucosa is the slight *submucosa*, which supports large blood-vessels, lymphatics, and mucous glands, and unites the mucosa to the cartilages. Above the mucosa lies the *basement membrane*, supporting a *stratified epithelium*, the upper cells of which are columnar and ciliated and may include amongst them the well-known *goblet-cells*, while the deeper layers are squamous and capable of regenerating the upper stratum if this be lost. The epithelium is pierced by the ducts of glands. Blood-capillaries, lymphatics, and fine nerves have all been shown to exist in the tracheal mucosa.

The same structural elements as are found in the trachea continue to be found in all the series of bronchial tubes above 1 mm. in diameter; they are arranged in much the same order, save that the muscular fibres are relatively increased and that they surround the whole tube (within the zone occupied by the cartilaginous nodules) somewhat like the tunica media of an artery. The mucous membrane is still ciliated, but its surface-cells are squat. On the other hand the bronchioles and alveolar passages have a different structure: cartilage and glands are no longer found; the epithelium is flat and ciliated; and the muscular fibres gradually thin out on the walls of the alveolar passages.

It is, however, the air-cells which have most interest for the physiologist. They are about $\frac{1}{16}$ th inch in diameter, and their walls are made up of a delicate film-like basement membrane, on the outside of which are numerous elastic fibres. Elastic connective tissue intervenes between neighbouring alveoli, and mingled with it are not a few involuntary muscular fibres. The alveoli are lined with flat cells in a single layer, some cells being large, clear, and polygonal, while others are small and granular, and are found singly or in groups of two or three inserted between the edges of the clear sort. The cells are united together by cement in which fine holes are sometimes to be seen; through these holes, or *pseudostomata*, migratory leucocytes can make their way into and out of the alveoli.

FIG. 1.—Histology of the lung-vesicles. V, V, blood-vessels bordering on the alveoli; c, c, blood capillaries of an alveolus; f, f, alveolar epithelium shown separately; E, E, relative position of alveolar epithelium and blood-capillaries; e, e, elastic texture of lung-substance. (From Hermann's *Handbuch der Physiologie*.)

The blood-vessels of the lung are of two sorts, nutritive and functional, *i.e.*, concerned in the function of the organs. The former are called *bronchial*, and arise from the aorta or intercostal arteries. They serve to nourish the tissues of the lung, and the blood they contain finds its way, in part into the bronchial veins and thence into the vena azygos, intercostal vein, or superior vena cava, and in part into veins of the functional system. The latter system of vessels consists of the *pulmonary arteries*, which arise in the

right ventricle and run through the lung substance *pari passu* with the bronchial tubes to the lobules. Here they branch into a dense network of capillaries which spread over the outside of the alveoli, embracing them so tightly as to indent their walls. From the capillaries the blood flows into pulmonary venules which run together to form the large *pulmonary veins*, which open into the left auricle. The pulmonary venules may anastomose freely, but the arteries never do so. The veins possess no valves.

The lymphatic vessels of the lung abound in all parts, but are usually described as having a threefold distribution,—(a) in the layer of tissue beneath the membrane investing the whole lung, (b) in the perivascular tissue, and (c) in the peribronchial tissue. When fine carbon particles are introduced into the alveoli of the lung they find their way with the greatest ease into the inter-alveolar tissues, and finally come to lie in the three positions just referred to, as may be demonstrated in the lung of any coal miner. The lymphatics of the membrane investing the lung communicate with the free surface of that membrane by means of openings not unlike the stomata of leaves.

The lungs, with the heart and great vessels, are the chief organs contained in the thorax, or that division of the great body cavity which lies above the diaphragm. Each lung is invested with a membrane called *pleura*, which plays a most important part in the mechanism of respiration.

The Pleural Membrane.—Let us imagine a bag shaped like an hour glass, and let us suppose one half of this bag to be packed up small and pushed through the constricted portion of the hour glass into the interior of the other half. We should then have a bag shaped like one half of an hour glass but provided with double walls—a more or less globular double-walled bag with a narrow opening into it. If further we imagine the interior of this double-walled bag (not the interior of the hour glass) to be entirely filled with one lung, we shall have an exact conception of the relationship of the lung to the pleura. The lung so covered is placed in its proper half of the thorax, which in circumstances of health it accurately fills. The outer layer of the double-walled bag is closely glued to the inner wall of the thorax. The inner layer is as firmly adherent to the surface of the lung. The space between the double walls, *i.e.*, the interior of the original hour glass, is called the *pleural cavity*; it is vacuous in health, being moistened by a mere trace of fluid. The substance of the pleural membrane is mainly connective tissue; and the interior of the pleural cavity is lined with a single layer of flat epithelial cells exhibiting the *stomata* already referred to.

The Thorax.—The chest or thorax is formed by the dorsal section of the *spinal column* behind, with the *ribs* that spring from it on each side, and the *sternum*, which lies between the ends of the ribs, in front. The dorsal spine is bowed, so that its concavity looks forward. The ribs, speaking generally, are bowed with their concavity turned towards the interior of the chest; and if we consider the plane of each rib, *i.e.*, that plane in which the arched rib would (approximately) lie flat, we shall find that it declines from the horizontal in a twofold manner—first the rib-plane slopes from behind downwards and forwards, and secondly it slopes on each side from the mesial plane of the body downwards and outwards. The ribs 1–7 are connected with the sternum by means of pieces of cartilage which really form the anterior portion of each rib arch; these ribs are called “true”; the eighth, ninth, and tenth ribs are united by cartilage, not to the sternum, but to the cartilages of the seventh, eighth, and ninth ribs respectively; these ribs are called “false”; the eleventh and twelfth ribs are called “floating” because they are unattached anteriorly. Each rib has a *head*, by which it is joined to the vertebral bodies constituting the spinal column; a *tubercle* or shoulder at a little distance away from the head, by which in all cases, except those of the tenth and eleventh ribs, it is joined to the transverse process of a vertebra; an *angle* or rough line a little beyond the tubercle, where the rib, rather suddenly, begins to sweep forwards; and a *neck*, the part intervening between the head and tubercle. The space between the ribs is filled up by two layers of muscles called *intercostal*—an outer or superficial layer, whose fibres run from above downwards and forwards, and a deeper or internal layer, whose fibres cross those of the former. The outer layer is not found between the costal cartilages in front, nor the inner layer between the costal necks behind. The upper opening of the thorax is filled by the windpipe blood-vessels and other structures passing into or out of the thorax. The floor of the thorax is formed by

The Diaphragm.—This consists of a thin arched muscular partition, whose fibres spring from the edge of the lower opening of the thorax and converge towards a sheet of tendon in the centre, which is shaped somewhat like a trefoil leaf. We may group the muscular fibres of the diaphragm according to the quadrant from which they spring:—(1) a vertebral portion, whose fibres stretch down to be attached in two well-marked columns or pillars to the bodies of some of the lumbar vertebrae and by tendinous arches to the transverse processes of the first lumbar vertebra and the twelfth rib; (2) a sternal portion, which springs from the back of the tip of the sternum, and from the sheath of the rectus abdominis muscles below it; (3) and (4) two

lateral or costal portions, which spring from the lower edge of the thorax all round from the tip of the twelfth rib to the junction between the sixth and seventh costal cartilage where the sternal portion begins. The

whole diaphragm forms a dome or cupola projecting so far into the thorax that the lateral vertical portions of the dome lie in close apposition to the walls of the thorax, as is shown in fig. 2. The top of the dome is somewhat flat and the right moiety of the top is on a higher level than the left, the highest point corresponding with the level of the junction of the right fifth rib with the sternum.

Other Muscles of Respiration.—The ribs are movable in the sense that each rib plane, which has been described as declining in two ways from the horizontal plane, may be made to approach the horizontal, and may afterwards return to its original

position. To accomplish these movements various muscles are provided, the exact position of which need not be very fully described. Suffice it to say that in general they arise from the vertebral axis, or from some extra-thoracic fixed point, and take hold of the movable parts of the thorax in such a manner that they can pull them up or pull them down. Such muscles are the following (enumerated without reference to their function as inspiratory or expiratory muscles; particular descriptions of them must be sought in the article ANATOMY):—*levator costarum*; the three *scalene* muscles; the *sterno-cleidomastoid*; *serratus posticus superior*; parts of the great *erector spinæ* muscle; possibly *serratus magnus*; *pectoralis minor* and *major* in certain positions of the arm; *obliquus externus*; *obliquus internus*; *transversalis abdominis*; *triangularis sterni*; *serratus posticus inferior*; *quadratus lumborum*. In addition to these muscles many others may lend occasional aid in respiration by fixing points, such as the *scapula*, otherwise too freely movable to act as a *point d'appui*; such are *trapezius*, *latissimus dorsi*, *rhomboidei*, and *levator anguli scapuli*.

Dimensions of the Thorax.—The circumference of the chest just below the level of the arms is about 34½ inches in men, and 32 inches in women. At the level of the tip of the sternum it is 32 and 30½ inches respectively. The measurement from clavicle to lower edge of thorax varies very much in different cases. The transverse diameter above the nipple is about 10 to 10½ inches in men, and about 9½ to 9¾ inches in women. The antero-posterior diameter, measured from the spines of the vertebrae behind to the surface of the chest in front is in the upper part of the chest about 6½ inches, and in the lower 7½ inches. The right half of the chest is generally somewhat larger than the left, because its muscles are usually better developed. Instruments for measuring the exact circumference of the chest at a given level are called *cyrtometers*; the best of these is a strip of lead which can be laid along the side of the chest from the spine round to the sternum, and which is pliable enough to follow the inequalities of the chest wall, yet resistant enough to keep the shape imparted to it.

For other figures illustrating the structure of thorax and lungs, see ANATOMY.

The Physiological Actions of the Respiratory Organs.

The organs above described perform during the whole of life certain movements. The commonest are the movements of ordinary quiet respiration, but we must include under the head of physiological actions, as distinguished from those provoked by disease, other movements, *viz.*, forced respiration, such as accompanies strenuous muscular exertion, and those modifications of the respiratory act called coughing, hawking, sneezing, snoring, crying, sighing, laughing, yawning, and hiccoughing.

FIG. 2.—Section through tip of 12th rib. (From Hermann.)

Normal Respiration.—If the naked body of a person asleep or in perfect inactivity be carefully watched, it will be found that the anterior and lateral walls of the chest move rhythmically up and down, while air passes into and out of the nostrils (and mouth also if this be open) in correspondence with the movement. If we look more closely we shall find that with every uprising of the chest walls the membranous intercostal portions sink slightly as if sucked in, while at the same time the flexible walls of the abdomen bulge as if protruded by some internal force. If respiration be in the slightest degree hurried these motions become so marked as to escape the attention of no one. The elevation of the chest walls is called *inspiration*, their depression *expiration*. Inspiration is slightly shorter than expiration, and usually there is a slight pause or momentary inaction of the chest between expiration and the following inspiration. Apparatuses for measuring the excursion of a given point of the chest wall during respiration are called *thoracometers* or *stethometers*. Apparatuses for recording the movements of the chest are called *stethographs* or *pneumographs*.

Frequency of Respiration.—The frequency of respiration during perfect rest of the body is 16 to 24 per minute, the pulse rate being usually four times the rate of respiration; but the respiratory rhythm varies in various conditions of life. The following are the means of many observations made by Quetelet: at the age of one year the number of respirations is 44 per minute; at 5 years, 26; from 15 to 20 years, 20; from 25 to 30, 16; from 30 to 50, 18.1. Muscular exertion always increases the frequency of respiration. The higher the temperature of the environment the more frequent is the respiration. Bert has shown that with higher atmospheric pressures than the normal the frequency of respiration is diminished while the depth of each inspiration is increased. The frequency of respiration diminishes until dinner time, reaches its maximum within an hour of feeding, and thereafter falls again; if dinner is omitted, no rise of frequency occurs. The respiratory act can be interrupted at any stage, reversed, quickened, slowed, and variously modified at will, so long as respiration is not stopped entirely for more than a short space of time; beyond this limit the will is incapable of suppressing respiration.

Depth of Respiration.—The depth of respiration is measured by the quantity of air inspired or expired in the act; but the deepest expiration possible does not suffice to expel all the air the lungs contain. The following measurements have been ascertained, and are here classified according to the convenient terminology proposed by Hutchinson. (1) *Residual air*, the volume of air remaining in the chest after the most complete expiratory effort, ranges from 100 to 130 cubic inches. (2) *Reserve or supplemental air*, the volume of air which can be expelled from the chest after an ordinary quiet expiration, measures about 100 cubic inches. (3) *Tidal air*, the volume of air taken in and given out at each ordinary respiration may be stated at about 20 cubic inches. (4) *Complemental air*, the volume of air that can be forcibly inspired over and above what is taken in at a normal inspiration, ranges from about 100 to 130 cubic inches. By *vital capacity*, which once had an exaggerated importance attached to it, is meant the quantity of air which can be expelled from the lungs by the deepest possible expiration after the deepest possible inspiration; it obviously includes the complemental, tidal, and reserve airs, and measures about 230 cubic inches in the Englishman of average height, i.e., 5 feet 8 inches (Hutchinson). It varies according to the height, body weight, age, sex, position of the body, and condition as to health of the subject of observation.

Vital capacity is estimated by means of a *spirometer*, a graduated gasometer into which air may be blown from the lungs.

The residual air, which for obvious reasons cannot be actually measured, may be estimated in the following way (Harless, Gréhant). At the end of ordinary expiration, apply the mouth to a mouth-piece communicating with a vessel filled with pure hydrogen, and breathe into and out of this vessel half a dozen times—until, in fact, there is reason to suppose that the air in the lungs at the time of the experiment has become evenly mixed with hydrogen. Then ascertain by analysis the proportion of hydrogen to expired air in the vessel and estimate the amount of the air which the lungs contained by the following formula:—

$$v : V + v = p : 100;$$

$$V = \frac{v(100 - p)}{p};$$

where V = volume of air in the lungs at the time of experiment, v = volume of the vessel containing hydrogen, p = proportion of air to hydrogen in the vessel at the end of the experiment. V , then, is the volume of air in the lungs after an *ordinary* expiration; that is, it includes the residual and the reserve air; if we subtract from this the amount of reserve air ascertained by direct measurement, we obtain the 100–130 cubic inches which Hutchinson arrived at by a study of the dead body.

Volume of Respiration.—It is clear that the ventilation of the lungs in ordinary breathing does not merely depend on the quantity of air inspired at each breath, but also on the number of inspirations in a given time. If these two values be multiplied together we get what might be called the *volume of respiration* (*Athmungsgrösse*, Rosenthal) in contradistinction to depth of respiration and frequency of respiration. Various instruments have been devised to measure the volume of respiration, all more or less faulty for the reason that they compel respiration under somewhat abnormal conditions (Rosenthal, Gad, Panum, Hering). From the data obtained we may conclude that the respiratory volume per minute in man is about 366 cubic inches (6000 cubic centim.). In connexion with this subject it may be stated that, after a single ordinary inspiration of hydrogen gas, 6–10 respirations of ordinary air must occur before the expired air ceases to contain some trace of hydrogen.

Types of Respiration.—The visible characters of respiration in man vary considerably according to age and sex. In men, while there is a moderate degree of upheaval of the chest, there is a considerable although not preponderating degree of excursion of the abdominal walls. In women the chest movements are decidedly most marked, the excursion of the abdominal walls being comparatively small. Hence we may distinguish two types of respiration, the costal and the abdominal, according to the preponderance of movement of one or the other part of the body wall. In forced respiration the type is costal in both sexes, and so it is also in sleep. The cause of this difference between men and women has been variously ascribed (*a*) to constriction of the chest by corsets in women, (*b*) to a natural adaptation to the needs of childbearing in women, and (*c*) to the greater relative flexibility of the ribs in women permitting a wider displacement under the action of the inspiratory muscles.

Certain Concomitants of Normal Respiration.—If the ear be placed against the chest wall during ordinary respiration we can hear with every inspiration a sighing or rustling sound, called “vesicular,” which is probably caused by the expansion of the air vesicles; and with every expiration a sound of a much softer sighing character. In children the inspiratory rustle is sharper and more pronounced than in adults. If a stethoscope be placed over the trachea, bronchi, or larynx, so that the sounds generated there may be separately communicated to the ear, there is heard a harsh to-and-fro sound during inspiration and expiration which has received the name of “bronchial.”

In healthy breathing the mouth should be closed and the ingoing current should all pass through the nose. When this happens the nostrils become slightly expanded with each inspiration, probably by the action of the M.

dilatatores naris. In some people this movement is hardly perceptible unless breathing be heavy or laboured. As the air passes at the back of the throat behind the soft palate it causes the velum to wave very gently in the current; this is a purely passive movement. If we look at the glottis or opening into the larynx during respiration, as we may readily do with the help of a small mirror held at the back of the throat, we may notice that the glottis is wide open during inspiration and that it becomes narrower by the approximation of the vocal chords during expiration. This alteration is produced by the action of the laryngeal muscles. Like the movements of the nostril, those of the larynx are almost imperceptible in some people during ordinary breathing, but are very well marked in all during forced respiration.

The Mechanics of Respiration.

In the description of the anatomy of the thorax it has been shown that the thorax is practically a closed box entirely filled by the lungs, heart, and other structures contained within it. If we were to freeze a dead body until all its tissues were rigid, and then were to remove a portion of the chest wall, we should observe that every corner of the thorax is accurately filled by some portion or other of its contents. If we were to perform the same operation of removing a part of the chest wall in a body not first frozen we should find, on the other hand, that the contents of the thorax are not by any means in such circumstances bulky enough to fill up the space provided for them. If we were to measure the organs carefully we should find that those which are hollow and whose cavities communicate with the regions outside the thorax are all larger in the frozen corpse than in that which was not frozen. In other words, the organs in the thorax are distended somewhat in order that they may completely fill the chest cavity; and the nature of this curious and important condition may best be illustrated by the simple diagrams, figs. 3 and 4 (from Hermann's *Physiologie des*

Fig. 3

Fig. 4.

Menschen),—where *t* is the trachea, *l* the lung, *v* the auricle of the heart, *k* the ventricle, *i* an intercostal space with its flexible membranous covering. When the interior of the vessel is rendered vacuous by exhaustion through the tube *o*, the walls of the lungs and heart are expanded until the limits of the containing vessel are accurately filled, while all flexible portions of the walls of the vessel (corresponding to the intercostal membranes and the diaphragm of the thorax) are sucked inwards.

From this description it follows that the lungs, even when the thorax is most contracted, are constantly over-

distended, and that, when the cause of this over-distension is removed, the lungs, being elastic, collapse. It further follows that if the thorax is dilated, the flexible hollow organs it contains must perforce be still more distended,—a distension which in the case of the lungs is followed by an indrawing of air through the trachea in all cases where the trachea is open. Thus, as the act of respiration is primarily a dilatation of the thorax, the part played by the lungs is, as Galen knew, a purely passive one.

How is dilatation of the thorax effected? It has been pointed out that the rib-planes decline from the horizontal in two directions, viz., from behind forwards, and from the antero-posterior mesial plane outwards; a glance at fig. 5 will make this double sloping clear to the reader. It has, moreover, been explained that the diaphragm arches upwards into the thorax in such a manner that the lateral parts of the arch are vertical and in contact with the inner face of the thoracic walls (see fig. 2). This being the structure of the thorax, the enlargement of its cavity is brought about (1) by raising the rib-planes until they approach the horizontal, and (2) by depressing the diaphragm and making its rounded dome more cone-like in outline. A moment's consideration will show how these actions enlarge the boundaries of the thorax. (a)

When the postero-anterior slope of the rib-planes is diminished by the raising of the anterior ends of the ribs, the whole sternum is thrust upwards and forwards, and the antero-posterior diameter of the thorax is increased. (b) When the lateral slope of the rib-planes is diminished by the ribs being moved upwards about an axis passing through their sternal and vertebral extremities, it is evident that the lateral diameter of the thorax must be increased. (c) When the muscular portion of the diaphragm contracts, the curves of its dome-like shape are straightened, the whole diaphragm comes to look more conical on section, and the apposition of its lateral parts to the inner surface of the thorax is destroyed; the two apposed surfaces are drawn apart much as the leaves of a book might be, and a space is formed between them, into which some portion of the lung slips. (d) When the diaphragm descends it draws with it the whole contents of the thorax; inasmuch as the contents as a whole are conical in shape with the apex upward and are fitted into the conical space of the thoracic cavity, it is clear that the descent of the contents will tend to create a space between them and the thoracic walls; for each stratum of lung, &c., which is adapted to fit a certain level of thorax, will thereby be brought into a lower and (as the thorax is conical) a more spacious level. Hence the descent of the diaphragm causes a much greater enlargement of the thorax than is measured by the mere elongation of the vertical diameter. In this manner the thorax is distended and air is drawn into the lungs. The contraction of the thorax in expiration is brought about by the return of the ribs and diaphragm to their original position of rest.

FIG. 5.—Showing slope of ribs. (From Hermann's *Handbuch*.)

We must now explain how the respiratory muscles effect these movements.

How the Inspiratory Movements are Produced.—The Rib Movements.—These are caused by the contraction of muscles which are fixed either to the central axis of the body (including under that term the head and vertebral column) or to some point rendered sufficiently stable for the purpose by the action of other adjuvant muscles. Thus the *M. levatores costarum* arise from the transverse processes of the 7th cervical and eleven upper dorsal vertebræ, and are attached to the ribs below in series; the *M. scaleni* spring from the cervical vertebræ, and are attached to the anterior parts of the first and second ribs; the *M. sternocleido-mastoidei* arise from the side and back of the skull, and are inserted into the upper part of the sternum and the clavicle; the *M. pectoralis minor* arises from the coracoid process of the scapula, and is inserted into the anterior ends of some of the ribs; the *M. serratus posticus superior* arises from certain of the cervical and dorsal vertebræ, and is inserted into the posterior part of certain of the ribs; the *M. cervicalis ascendens* (part of the *M. erector spinæ*) arises from certain of the cervical vertebræ, and is inserted into the posterior part of certain ribs. The *M. serratus magnus* and the *M. pectoralis major*, which are affixed on the one hand to the upper arm and to the scapula respectively and on the other to the ribs and to the sternum respectively, may in certain elevated positions of the arm and shoulder act as inspiratory muscles. When all these muscles contract, the ribs are raised in the twofold way already described, some pulling up the anterior ends of the ribs, and others causing the arched ribs to rotate about an axis passing through their vertebral and sternal joints.

In addition to the muscles just enumerated the *M. intercostales externi* are undoubtedly inspiratory muscles. Every external intercostal muscular fibre between a pair of ribs must, when it contracts, of necessity raise both ribs, as is clearly shown by the accompanying diagram (fig. 6). Here $a'b'$ must be shorter than ab , for if $BA\alpha = \alpha$, then

$$ab^2 = AB^2 + (Bb - Aa)^2 + 2AB(Bb - Aa) \cos \alpha;$$

hence ab will be larger the smaller the angle α , for the cosine increases as the angle diminishes.

By a similar geometrical treatment of the question it may be shown that the internal intercostal muscles when they contract must of necessity depress both the ribs to which they are attached. If the angle P The α (fig. 7), then

$$c'd'^2 = AB^2 + (Aa' - Bb')^2 - 2AB(Aa' - Bb') \cos \alpha;$$

hence $c'd'$ will be larger the larger the angle α .

The case, however, is not so clear with reference to the anterior portions of the internal intercostals which lie between the cartilages; for it is evident that these fibres have the same direction with regard to the sternum as an axis as the external intercostals have with regard to the vertebral column as an axis; that is to say, the geometrical diagram in fig. 6 applies to the intercartilaginous internal intercostals as perfectly as it does to the interosseous parts of the external intercostals, the inference being that the intercartilaginous internal intercostals tend to elevate the pair of ribs between which they stretch. The geometrical argument is, however, overborne by physiological experiment: Martin and Hartwell have observed in the dog and the cat that the internal intercostals

throughout their whole extent contract (not synchronously) but alternately with the diaphragm; hence we must conclude that their function throughout is not inspiratory like that of the diaphragm, but expiratory.

The Movements of the Diaphragm.—The muscular fibres of the diaphragm are arranged in a radial manner, or more strictly speaking in a manner like the lines of longitude on a terrestrial globe. The central tendon of the diaphragm corresponds to the pole of such a globe. The contraction of the fibres is expended on straightening the longitudinal curves rather than on pulling down the central tendon to a lower level; in fact the central tendon moves very little in ordinary respiration.

How the Expiratory Movements are Produced.—The action of inspiration disturbs many organs from the position of rest into which gravity and their own physical properties have thrown them. The ribs and sternum are raised from the position of lowest level; the elastic costal cartilages are twisted; the elastic lungs are put upon the stretch; the abdominal organs, themselves elastic, are compressed and thrust against the elastic walls of the belly, causing these to bulge outwards. In short the very act of inspiration stores up, as it were, in sundry ways the forces which make for expiration. As soon as the inspiratory muscles cease to act these forces come into play, and the position of rest or equilibrium is regained. It is very doubtful whether any special expiratory muscles are called into action during ordinary respiration. The internal intercostals may in man be exercised in ordinary expiration (although they are certainly not so exercised in the dog and the cat); but in laboured expiration many muscles assist in the expulsive effort. The muscles forming the belly walls contract and force the abdominal contents against the relaxed diaphragm in such a manner as to drive it farther and farther into the thorax. At the same time by their attachment to the lower edge of the thorax these same muscles pull down the ribs and sternum. The *M. triangularis sterni*, which arises from the back or thoracic aspect of the sternum and lower costal cartilages and is inserted into the costal cartilages higher up, can obviously depress the ribs. So also can the *M. serratus posticus inferior*, which arises from the thick fascia of the loins and is inserted into the last four ribs. So also can the *M. quadratus lumborum*, which springs from the pelvis and is attached to the last rib. Indeed there is hardly a muscle of the body but may be called into play during extremely laboured respiration, either because it acts on the chest, or because it serves to steady some part and give a better purchase for the action of direct respiratory muscles.

Certain Abnormal Forms of Respiration.

Coughing.—There is first a deep inspiration followed by closure of the glottis. Then follows a violent expiratory effort which bursts open the glottis and drives the air out of the lungs in a blast which carries away any light irritating matter it may meet with. The act is commonly involuntary, but may be imitated exactly by a voluntary effort.

Hawking, or Clearing the Throat.—In this act a current of air is driven from the lungs and forced through the narrow space between the root of the tongue and the depressed soft palate. This action can only be caused voluntarily.

Sneezing.—There is first an inspiration which is often unusually rapid; then follows a sudden expiration and the blast is directed through the nose. The glottis remains open all the time. The act is generally involuntary, but may be more or less successfully imitated by a voluntary effort.

Snoring is caused by unusually steady and prolonged inspirations and expirations through the open mouth,—the soft palate and uvula being set vibrating by the currents of air.

Crying consists of short deep inspirations and prolonged expirations with the glottis partially closed. Long-continued crying leads to sobbing, in which sudden spasmodic contractions of the diaphragm cause sudden inspirations and inspiratory sounds generated in larynx and pharynx.

Sighing is a sudden and prolonged inspiration following an unusually long pause after the last expiration.

Laughing is caused by a series of short expiratory blasts which provoke a clear sound from the vocal chords kept tense for the purpose, and at the same time other inarticulate but very characteristic sounds from the vibrating structures of the larynx and pharynx. The face has a characteristic expression. This act is essentially involuntary, and often is beyond control; it can only be imitated very imperfectly.

Yawning is a long deep inspiration followed by a shorter expiration, the mouth, fauces, and glottis being kept open in a characteristic fashion. It is involuntary, but may be imitated.

Hiccough is really an inspiration suddenly checked by closure of the glottis; the inspiration is due to a spasmodic contraction of the diaphragm. The closure of the glottis generally leads to a characteristic sound.

Innervation of the Respiratory Movements.

The respiratory actions are seen from the above description to be very complicated: their regular performance depends upon the coordination of a great number of factors; and, inasmuch as the respiratory movements do not happen invariably after one stereotyped pattern, but admit of various modifications, such as sighing, hiccupping, &c., we must infer that the coordination is such as to admit of corresponding variations. The coordination of the inspiratory and expiratory movements is brought about through the nervous system, the connexion of which with the organs of respiration already described must now be stated.

Speaking very generally, there is a nervous centre in the cerebro-spinal axis from which certain nerve fibres proceed to the muscles of respiration; these are called the efferent or centrifugal fibres. There are other fibres which run from the peripheral parts of the body towards the same centre and exert a control over it; these are called afferent or centripetal. The impulses to movement start from the centre and travel down the efferent fibres to the muscles, while impressions arising in the periphery of the body are carried along the afferent fibres to the centre and modify its action.

The Respiratory Centre.—There is a portion of the medulla oblongata destruction of which causes immediate and permanent cessation of all respiratory movements. This spot has been found to lie in the grey substance near the tip or nib of the calamus scriptorius; it extends on both sides of the middle line, and has received the name of "le nœud vital" (Flourens). If the spinal cord be severed immediately below the spot, all respiratory movements in the parts of the body below the level of section cease at once, while movements of respiration in parts situated above the level (e.g., in the face) continue momentarily. If the severance be made above the vital knot, the facial movements of respiration cease, while those of the trunk continue. The nervous centre is bilateral, each half serving its proper side of the body; if the medulla oblongata be split longitudinally in the middle line, through the nœud vital, respiration goes on unchecked; but if one lateral half of the vital area be destroyed, respiration at once ceases on the same side of the body.

While the above hypothesis of a respiratory centre in the medulla presiding over the movements of respiration is in all probability substantially correct, it must be stated that, in certain circumstances of experiment (e.g., when the animal is young and has been poisoned with strychnia, or is kept in a warm chamber), respiratory movements do occur even when the medulla oblongata with the nœud vital has been removed. That is to say, there are centres in the cord of a lower order than the medullary respiratory centre which are under ordinary circumstances dependent on the main centre but which may act independently.

The respiratory centre must be regarded as the seat of origin of the impulses which cause the muscular movements of inspiration and expiration. During the whole of intra-uterine life the centre is inactive, but almost immediately after the child is born, or the placental circulation is interrupted by compression of the umbilical blood-vessels, the centre becomes quickened, and fails not to yield the appropriate stimulus at short intervals during the whole after-period of life. It is impossible to resist the conclusion that the immediate cause of the activity of the respiratory centre is the impure and impoverished state of the blood, which it is the function of respiration to remedy. So long as the placenta performs the function of purifying the blood of the foetus and supplying it with oxygen the respiratory centre is quiescent; the moment the placenta becomes incapable of purifying the foetal blood, as, for example, when the mother is suffocated or asphyxiated, the respiratory centre prepares to act and respiratory movements follow.

If it is true that the presence of impure or venous blood in the respiratory centre is the cause of the first respiratory act of an animal, it is also true that the presence of highly arterialized blood is sufficient to render the centre absolutely inactive again. If air or oxygen gas be driven through the lungs of an animal and allowed to escape through holes made in the chest walls, the blood becomes so rapidly and perfectly purified that the whole vascular system is filled with the pure blood which is commonly found in the arteries only. In this case the movements of respira-

tion cease until such time as the blood has again lost its purity, when respiration begins, as one might say, *de capo*. There is no doubt that the essential cause of the inactivity of the respiratory centre in this experiment is the presence in excess of oxygen gas, and that the absence of a certain proportion of oxygen in the blood circulating in the body endows the blood with a power of stimulating directly or indirectly the respiratory centre. To this subject we shall return.

The Efferent Fibres.—The fibres proceeding from the respiratory centre run down the spinal chord and emerge for the most part in the cervical and dorsal region. Some fibres are collected into a nerve trunk which takes its rise in the third, fourth, and fifth cervical nerves; this is the *phrenic nerve*, which supplies that half of the diaphragm lying on the corresponding side of the body. Section of one phrenic nerve causes paralysis of the corresponding half of the diaphragm. Other fibres run in the *intercostal nerves* for the supply of the intercostal muscles, levatores costarum, &c.; others again run in the *cervical nerves* for the supply of the sterno-mastoid, scaleni, &c. Section of these nerves leads to paralysis of the muscles supplied by them. The facial muscles of respiration are supplied by efferent fibres from the seventh cranial nerve, and the laryngeal muscles by the laryngeal branches of the vagus.

In addition to the nerves which supply the respiratory muscles, there are efferent fibres which run in the course of the vagus to the muscles supplying the larynx and the bronchial tubes. The vagi (also called the pneumogastric nerves) are two important trunks which arise from the medulla oblongata, and, after receiving communications for neighbouring nerves, run down by the side of the windpipe to reach the thorax and abdomen. By means of appropriate apparatus, of which several varieties have been devised, contraction of the small bronchial tubes may be readily made sensible and even graphically recorded. A study of the experimental results obtained after electrical stimulation of the pneumogastric nerves leaves no doubt that these nerves contain motor fibres for the bronchial tubes. The exact distribution of the superior and inferior laryngeal branches of the vagus to the muscles of the larynx is described under ANATOMY.

The Afferent Fibres.—Many nerve fibres have been ascertained by physiological experiment to have communication with the respiratory centre. For example, the nerves of the skin of the chest, when stimulated by the application of cold water, cause a gasping inspiration; the nerves of the skin of the sides of the body and of the soles of the feet, when stimulated by tickling, cause that peculiar series of spasms of the diaphragm which constitute laughing; and so on. But the vagus nerve is that which contains the afferent fibres of chief importance to the respiratory movements. The vagus fibres proceeding from larynx, trachea, lung, and stomach certainly, and possibly also those proceeding from other organs of the abdomen, are all capable of influencing the activity of the main respiratory centre. If the trunk of the vagus nerve on each side of the neck be laid bare and divided in an animal such as a rabbit, the respiratory movements become much less frequent but at the same time deeper. If the end of the nerve above the point of section be carefully stimulated by a weak electric current, respiration again becomes quicker and proportionately shallow until in fact the natural type is restored. If the strength of stimulus be still further increased, the rapidity and the shallowness of breathing become still more remarkable, until a degree of stimulation is reached when there is no longer any rhythmical character in respiration, which is reduced to a feeble inspiratory spasm. These facts are conveniently grouped and explained by the following hypothetical statement. The vagus nerve contains fibres running up to the respiratory centre which have the function of modifying the native tendencies of the centre in such a manner as to accelerate its explosions of activity and at the same time render them less formidable. These fibres are constantly in action during healthy life; hence, on dividing the vagus trunk including these fibres, the respiratory centre reverts to its natural type of slow and deep action. On stimulating these fibres artificially they may be brought to spur on the centre once more, or even carry the accelerating process to the point of producing continuous inspiration.

Experiment has, however, shown that the influence of the vagus nerve is not so simple as is here supposed. There are other fibres in the vagus which seem to arise in the larynx and run in the trunk of the two laryngeal (but chiefly in the superior laryngeal) branches of the nerve; these have powers exactly opposed to those ascribed to the main-trunk fibres. If the superior laryngeal nerve be divided and the higher end at the point of division be stimulated, respiration becomes less frequent and more powerful. These fibres of opposite tendencies run side by side in the vagus trunk, and must be alike excited when an electrical stimulus is thrown into the nerve. The fact that the total result of stimulation is in favour of the first-described accelerating nerves may be hypothetically explained by supposing the accelerating fibres to be more numerous, or more potent with the given stimulus, than the slowing fibres.

Nature of the Activity of the Respiratory Centre.—Various interest-

ing questions arise as to the exact mode of action of the respiratory centre. Is there an expiratory centre apart from the inspiratory? In ordinary quiet breathing expiration is not a muscular act in the sense that inspiration is; but in laboured breathing many muscles are coordinated to help in the act; we may therefore assume that there is an expiratory coordinating mechanism as well as an inspiratory. Another inquiry touches the question of the stimulation of the respiratory centre. We have arrived at the conclusion that a certain impoverished or impure state of the blood is the cause of the activity of the respiratory centres. Is it by a direct action of the blood on the nerve centre, or is it by an action of the blood upon the end-organs of nerves in the peripheral parts of the body which indirectly induce the respiratory centre to act? In other words, would the respiratory centre act under the stimulus of a certain degree of impurity of its blood if it were cut off absolutely from its afferent fibres? This is not a question which admits of an absolutely decisive experimental answer; but this may be said in reference to it, that, if the cerebrum be extirpated, the pneumo-gastric nerves divided, and the spinal chord severed at a point below that from which the main respiratory efferent nerves emerge, notwithstanding that the respiratory centre is thus separated from by far the greater number of the sensory nerves of the body, respiration still goes on. Further, if the spinal axis is divided at a level immediately above that of the respiratory centre, respiration goes on in the lower parts of the body but ceases in the upper—that is, the facial movements cease; while, if the division be carried through a point immediately below the level of the respiratory centre, although chest movement ceases and respiration may in strictness be said to be permanently stopped, yet the facial movements, which are just as essential to the complete idea of respiration, and which are innervated from the common respiratory centre, continue to be performed so long as any life remains in the mutilated animal. There is therefore a very strong presumption that the respiratory centre is automatic, that is, that it has within itself the spring of its own activity, and that the impurity of the blood which sets the respiratory mechanism agoing does so by acting upon the respiratory nervous centre directly. However started, the inspiratory stimulus is discharged rhythmically down the efferent respiratory nerve during healthy life. The rhythm is capable of wide variation, both by the exercise of the will and by the operation of external conditions, such as heat and muscular exercise of the body, which accelerate respiration independently of the will. The question why the discharge is rhythmical is one of the deeper problems of physiology, and touches the essential nature of nervous actions in general. It is customary in physiological treatises to illustrate it by supposing a mechanism which offers a resistance to the discharges of its own energy; when the energy reaches a certain degree of tension resistance is overcome and the discharge takes place, but a certain time must elapse before energy can again accumulate to the extent of overcoming resistance. It is further supposed that resistance is capable of being varied by external agencies; when it is increased the discharges occur at longer intervals, because more energy must be accumulated before resistance can be overcome, but at the same time they are more violent; when resistance is diminished, the discharges are more rapid but less powerful, until, when resistance becomes *nil*, the discharge is continuous. Such illustrations are, however, of very doubtful value; they impart a sense of clearness to our views of nervous action by turning attention from the problem we wish elucidated to another and altogether different problem. There is in fact no probability whatever, so far as facts yet go, that nervous rhythmic action is brought about in any such way.

CHEMISTRY OF RESPIRATION.

The mechanism which has just been described has for its object an interchange of substances between the body and the external medium. Certain substances pass out of the body at the lungs, and others are taken into the body. The discussion of this interchange pertains to what is called the Chemistry of Respiration.

Comparison of Inspired and Expired Air.—No inconsiderable knowledge of this exchange of matters may be obtained at once by a simple comparison of inspired and expired air. The air we breathe varies somewhat according to the various circumstances of season, time of day, height above sea level, prevailing wind, &c.; but all samples of pure atmospheric air have substantially the following composition:—

1. Gases:—	
Oxygen	20·84 to 20·92 vols. p.c.
Nitrogen	79·00 to 79·05 „
Carbon dioxide	0·04 „

2. Aqueous vapour.—The absolute amount of this ingredient varies very much, and must be distinguished carefully from the relative or sensible moisture, which depends more upon the temperature of the air than upon the absolute quantity of watery vapour it contains.

Air which is expired from the lungs has approximately the following composition:—

1. Gases:—	
Oxygen.....	16·03 vols. p.c.
Nitrogen.....	79·02 „
Carbon dioxide.....	3·3 to 5·5 „

Probably there is an exceedingly small excess of nitrogen in expired air as compared with inspired air.

2. Aqueous vapour.—The absolute amount is always such as to saturate the air at the temperature which it has on expiration, *i.e.*, 36°·3 C.

3. Organic matter of uncertain composition but hurtful when reinhaled.

On an average (subject, however, to considerable variations) it appears that the body takes up in respiration oxygen gas to the amount of 4·78 vols. per cent. of the air inhaled, and it gives off carbon dioxide to the average amount of 4·38 vols. per cent., besides traces of nitrogen, ammonia, hydrogen, and light carburetted hydrogen. Leaving out of calculation the minute traces of the latter bodies, it will be observed that the volume of oxygen taken into the body is larger than the volume of carbon dioxide given off; and, since, under like conditions of pressure and temperature, equal volumes of oxygen gas and carbon dioxide gas contain the same quantity of oxygen, it is clear that more oxygen enters the body at the lungs than escapes from it; therefore the whole of the oxygen taken into the body does not leave it as carbonic acid or expired air. The ratio of CO₂ expired to O absorbed is called the “respiratory quotient”—

$$\frac{\text{CO}_2}{\text{O}} = \frac{4\cdot38}{4\cdot782} = 0\cdot916.$$

Composition of Air in the Air Cells.—The whole of the air of the lungs is not expelled at each breath, some remaining in the depths as residual air lodged in the alveoli or air cells. Hence we cannot assume, from an examination of expired air, that we know the constitution of the air in the recesses of the lungs where it comes most intimately into contact with the blood. To attain such knowledge it is necessary to examine the deeper air directly, and the air is obtained for such purposes by means of a lung catheter.¹ In this way it has been ascertained that the alveolar air of a dog's lung contained about 3·8 per cent. of CO₂ at a time when the expired air contained about 2·8 per cent. As to the amount of O we may safely assume that the alveolar air never in ordinary circumstances contains less than 10 per cent. when the expired air contains 16 per cent.

Daily Quantity of Substances Exchanged.—During 24 hours an average person would take in about 10,000 grains of oxygen in respiration, and give out about 12,000 grains of carbon dioxide, corresponding to 3300 grains of carbon; at the same time about 9 oz. of water would be exhaled. These quantities vary, however, within wide limits according to the conditions of age, sex, atmospheric pressure, and the like. Thus, for example, in young persons the O absorbed is relatively greater than the CO₂ given off, and a child gives off twice as much CO₂ in relation to its body weight as an adult. Again, males

¹ This is a flexible tube so thin as to pass readily into a small bronchial tube. It is provided with an india-rubber collar, which is capable of inflation. The apparatus is passed (with the collar collapsed) through a hole in the trachea and guided into one of the finer bronchial tubes; the collar is then inflated, and serves to fix the catheter hermetically in the bronchial tube and to place that tube with its tributary tubes and alveoli in direct communication with the outer air through the fine catheter. Breathing is unimpeded; and air may be collected from the recesses of the lung for analysis.

after the first few years of life give off more CO_2 than females. When the external temperature is so low as to depress the body temperature, less CO_2 is given off; if it is so high as to raise the body temperature, the CO_2 is increased. If, however, the surrounding medium is cooler than the body but not cold enough to lower the body temperature, more O is taken in, and more CO_2 is given out; and *vice versa*. Muscular exercise also increases considerably the CO_2 given off; and more CO_2 is given off a short time after a meal than during fasting, especially when the meal includes substances rich in carbon. Speaking generally, alcohols, ethers, tea, &c., diminish the CO_2 ; but the results are not constant. Again, while the number and depth of the respirations do not influence the formation of CO_2 in the body, they affect the removal of that which is already formed. Increased rate of respiration and increased depth of respiration both cause an absolute increase in the quantity of CO_2 expired, although with reference to the total amount of air which passes into and out of the lungs during such laboured breathing the CO_2 is relatively diminished. Lastly, when the atmospheric pressure is diminished, as in ballooning, respiration becomes difficult, CO_2 is imperfectly removed from the body, and the blood contains less O. When pressure is increased, respiration is easy and slow (2-4 per minute), the capacity of the lungs increases, the activities of the tissues are marked, and as a result of this more O is absorbed and more CO_2 is excreted.

The Blood in Respiration.

Having ascertained the nature and quantity of the materials exchanged in the lungs, we may now ask concerning the method of the exchange. There is no difficulty in understanding how the cold air introduced into the lungs is warmed and saturated with moisture by contact with the moist walls of the air passages and bronchi. As to the gaseous substances which appear in traces in the expired air nothing definite is known; they may in part arise in the decomposition of the solid organic impurities of expired air, and may in part escape from the blood itself. The origin of the solid poisonous organic substances, which are of such vital interest from a sanitary point of view, is also a matter of great obscurity. Some portions of it doubtless consist of effete particles of tissue from the walls of the bronchial tubes and cavity of the mouth and nose; for example, epithelial scales may be discovered in the condensed moisture of the air expired into an ice-cold globe, and so also may the organized bacilli of tubercle when the subject of experiment happens to be phthisical. Other portions may spring directly from the blood. The chief inquiry, however, centres about the origin of the carbon dioxide and the absorption of the oxygen, for the understanding of which a knowledge of the blood is necessary.

The Blood.—This, as it circulates in the vessels of man and vertebrates generally, is a viscous and to the naked eye homogeneous liquid of red colour,—the blood of the pulmonary veins, of the left side of the heart, and of the systemic arteries being normally of a bright scarlet hue, and the blood of the right side of the heart, of the systemic veins, and of the pulmonary artery being of a brownish-red colour. In other words the blood enters the capillaries of the lungs of a brownish-red colour, and leaves them bright scarlet in hue; it enters the general capillaries of the body as a bright scarlet fluid and leaves them as a brownish-red fluid. Although homogeneous to the naked eye, the blood is found on microscopic examination to consist of a colourless fluid, called *liquor sanguinis* or *plasma*, holding in suspension large numbers of solid bodies, the *corpuscles* of the blood; the more numerous of

these are *red*, the others are colourless and are commonly spoken of as *white*. The specific gravity of blood probably varies between 1045 and 1075. Fresh blood is feebly alkaline in reaction.

When blood is shed it remains for a minute or two as fluid as it is in the blood-vessels; but in 2-6 minutes it begins to pass into the state of a soft red jelly, which gradually acquires greater consistence, and by the contraction of one of its constituents at length expresses a fluid; the contracted jelly is called the *clot*, or *crassamentum*; the expressed fluid is the *serum*; and the whole process is denominated *coagulation*. Contraction of the clot may go on for 10-48 hours. This process of coagulation is due to the separation from the plasma of a body called *fibrin*, which entangles in its meshes the corpuscles of the blood. When coagulation is delayed for several minutes (as it always is in horse's blood, and as it usually is in the blood of men suffering from inflammatory diseases), the blood corpuscles, being specifically heavier than the plasma, have time to subside a little way before coagulation commences. Hence the uppermost layers of such blood become nearly free from coloured corpuscles; and subsequently, when the blood coagulates, the clot exhibits the phenomenon of the *buffy coat*,—that is, the upper part of the clot is of a yellowish colour. If, instead of allowing blood to coagulate undisturbed, it be stirred or whipped with twigs, the fibrin does not entangle the corpuscles but separates as a stringy mass which adheres to the twigs; the corpuscles remain in the serum and constitute *defibrinated blood*. Coagulation is promoted (a) by exposure to a temperature slightly higher than that of the living body; (b) by contact with foreign matter; (c) by the addition of minute quantities of common salt or other neutral salts. It is delayed or suspended (a) by exposure to an ice-cold temperature; (b) by contact with the living blood-vessels; (c) by the addition of a sufficient quantity of sodium chloride, sodium sulphate, or some other neutral salts.

Reviewing all the facts which have been ascertained respecting coagulation, it would appear that the process is dependent upon the presence in the liquor sanguinis of a proteid body called fibrinogen, which under favourable circumstances undergoes conversion, or perhaps decomposition, into fibrin. This conversion, when it occurs outside the body, appears to be connected with the action of a ferment produced in the colourless corpuscles, and probably only set free when they break down.

The red corpuscles of man and the *Mammalia* generally, except the *Camelidae*, are biconcave disks, possessing neither skin nor nucleus or interior body. In birds, reptiles, and most fishes they are nucleated, elliptical, and biconvex. In the camel the red corpuscles are oval. The average diameter of the disk in man is $\frac{1}{3200}$ inch and the thickness about $\frac{1}{12400}$ inch.

The substance of which the red disks is composed is elastic; the disks may therefore be squeezed through fine chinks smaller than their own diameter and may afterwards regain their original shape. When in the blood-vessels the red corpuscles are hurried along indiscriminately in the blood current, but when the blood stands the red corpuscles cling together in rows like piles of coin, which are technically called *rouleaux*; this is a physical phenomenon entirely due to the shape of the corpuscles. The white or colourless corpuscles are globular masses of granular protoplasm, provided with one or more interior bodies called nuclei, but destitute of a skin. They have the power of independent movement, which the red cells have not, resembling in this respect the *amœba*. They can send out processes, change their outline, and move from place to place by laying hold on resistant objects by means of a projected process and dragging their bodies

along. They have a diameter of $\frac{1}{2500}$ inch when at rest and globular. They are far less numerous than the red corpuscles; the proportion of white and red corpuscles in various conditions is shown in the following table:—

In the morning fasting state	1 : 716
Half an hour after breakfast.....	1 : 347
Three hours after breakfast.....	1 : 1514
In the splenic vein	1 : 60
In the splenic artery.....	1 : 2260
In the hepatic vein.....	1 : 170
In the portal vein.....	1 : 740

In addition to typical white and red corpuscles there are others, provisionally called *intermediate corpuscles*, *red granular corpuscles*, or *haematoblasts*, which are granular and nucleated. Probably these corpuscles are involved in a special manner in the development of the fibrin-ferment. It has been calculated that one cubic millimetre (*i.e.*, a cube whose side measures about $\frac{1}{25}$ inch) contains five million corpuscles of all kinds.

The chief constituents of the blood may now be discussed seriatim:—

Constituents of the Liquor Sanguinis.

Fibrin.—When fresh this is an elastic substance belonging to the group of proteid bodies; it is insoluble in pure water, but

FIG. 8.—Blood corpuscles. A, Moderately magnified; red corpuscles in rouleaux; white corpuscles at a, a, B, C, D, Red corpuscles more highly magnified. E, Red corpuscle swollen to a sphere by imbibition of water. F, White corpuscle, magnified same as B; G, the same, throwing out blunt processes; H, the same, treated with acetic acid, and showing nucleus magnified same as B. is soluble in solutions of common salt and in dilute hydrochloric acid at the temperature of the body. Human venous blood yields from 2.2 to 2.8 parts per thousand of fibrin. So far as we know, fibrin does not exist as such in the plasma before it is coagulated; but there does exist a body, fibrinogen, which is the precursor of fibrin. It may be separated from plasma by diluting the plasma freely with water at an ice-cold temperature, and passing for a long time a stream of CO₂ through it; or by adding common salt to plasma until the plasma contains 12 to 16 per cent. of salt the fibrinogen is precipitated in a flaky form. Besides fibrinogen, liquor sanguinis contains another proteid body intimately concerned in the formation of fibrin; this is *serum-globulin* or *para-globulin*. It also may be precipitated from diluted plasma by a stream of CO₂; but it may be much more perfectly eliminated by adding magnesium sulphate until the plasma is saturated. It is a body the presence of which greatly facilitates or promotes the development of fibrin from fibrinogen; indeed some observers have sup-

posed that fibrin arises in the union of the two bodies fibrinogen and para-globulin.

Serum-albumin.—This is a proteid body which coagulates on heating.

Certain extractive matters.—These include neutral fats, lecithin, and cholesterolin; sugar; urea, uric acid, creatine, creatinine, &c.; and a yellow pigment.

Inorganic Salts.—These are the chlorides, phosphates, and sulphates of sodium, potassium, calcium, and magnesium; sodium and chlorides are the main constituents.

Gases.—Especially CO₂; but see below.

Constituents of the Red Corpuscles.

Oxyhæmoglobin.—This interesting substance has the general chemical composition of an albuminous body with the addition of the element iron:—C, 54.00; H, 7.25; N, 16.25; Fe, 0.42; S, 0.63; O, 21.45=100.00.

It is the cause of the red colour of the corpuscles. It may be obtained in the form of beautiful crystals by a variety of methods, which all have the following steps in common:—(1) to effect the solution of the oxyhæmoglobin of the red corpuscles in the serum or in water, and (2) to effect the crystallization of it from solution either by adding alcohol, or by cold, or by both combined. The forms of the crystals differ in different animals; the chief forms are given in fig. 9. Oxyhæmoglobin has the property of giving up a portion of its oxygen on very slight provocation, *e.g.*, when treated with easily oxidizable substances, or when submitted to moderate heat in a vacuum. The resulting substance is called reduced hæmoglobin or, shortly, hæmoglobin; it is capable of reproducing the original oxyhæmoglobin on simple exposure to oxygen or to air. This property is of the highest importance in the function of respiration, as will be explained in the section on the gases of the blood.

FIG. 9.—Crystals of oxyhæmoglobin; a, b, c, e, forms from blood of man and majority of mammals; d, tetrahedral crystals from blood of guinea-pig; f, hexagonal crystals from squirrel's blood.

Solutions of oxyhæmoglobin of moderate strength have the fine scarlet hue of arterial blood. When interposed between the sun and a spectroscope they cause the absorption of definite portions

FIG. 10.—1, 2, Spectra of solutions,—1 containing less than 0.01 per cent. and 2 containing 0.37 per cent. of oxyhæmoglobin; 3, spectrum of solution containing about 0.2 per cent. of hæmoglobin.

of the spectrum, and give a characteristic appearance to it. After the solution has been reduced (as it may be very readily by means of an alkaline solution of a ferrous salt, in which precipitation of ferrous hydrate is prevented by the presence of tartaric or citric acid), it assumes a brownish colour and the absorption spectrum becomes changed. The spectra of oxyhæmoglobin and of reduced hæmoglobin when the solutions are of moderate strength are given in fig. 10.

It has been determined that 1 gramme of hæmoglobin can link to itself 1.671 cc. of oxygen gas (at 0° C. and 760 mm. pressure) in the above-described loose manner,—that is, in such a manner that when admitted to a vacuous space at a moderate temperature the two become again dissociated.

When blood or a solution of oxyhæmoglobin is shaken up with carbon monoxide, the “dissociable” or “respiratory” oxygen is displaced, and a new compound of CO and hæmoglobin is formed which has a spectrum very like that of oxyhæmoglobin, but is incapable of reduction by the means which are sufficient to reduce oxyhæmoglobin. In like manner (with certain precautions) a compound of hæmoglobin with NO may be formed.

Various products of the destructive decomposition of hæmoglobin are known, possessing characteristic spectra and properties; these need not be further described.

Proteid Substances.—Besides oxyhæmoglobin, the red corpuscles contain other proteid substances, probably for the most part paraglobulin.

Lecithin.

Cholesterin.

Inorganic Salts.—Potassium and phosphates are the main constituent; sodium, calcium, and magnesium are also found as chlorides and sulphates.

Gases.—See below.

Constituents of the White Corpuscles.

Proteid Substances.—Several varieties have been separated.

Lecithin.

Certain extractives, including glycogen.

Inorganic Salts.—Especially potassium and phosphates.

The Gases of the Blood.

The blood when admitted into a vacuous space readily gives up more than half its volume of mixed gases, consisting of oxygen, carbon dioxide, and nitrogen. The oxygen is present in much larger quantities than could be held in simple solution by the water of the blood; it is in fact mainly held in feeble combination by the hæmoglobin of the coloured corpuscles; only a trace of it is, under ordinary circumstances, held in true solution. The carbon dioxide, whilst not existing in larger quantity in blood than would be possible if it were simply dissolved by the water of that fluid, is

From 100 vols. of Blood.

	O.	CO ₂ .	N.
Arterial.....	22 vols.	35 vols.	1-2 vols.
Venous.....	8-12 vols.	40-50 vols.	1-2 vols.

The method of extracting the gases of the blood which has been found to be most convenient is one in which the blood is introduced into the Torricellian vacuum existing above the column of mercury in a barometer. Blood is collected over mercury in such a way as to avoid all access of air; it is then introduced by an appropriate mechanism into the space above the barometric mercury. At once the gases froth up and fill the space; the aqueous vapour which at the same time arises is absorbed by a special drying apparatus communicating with the vacuum. Means exist of warming the vacuous space up to about 45° C., which is a temperature sufficient to cause the escape of nearly all the gases of the blood; the last portions of carbonic acid are, however, more rapidly evolved by allowing a small volume of a thoroughly boiled-out solution of phosphoric acid to enter the blood receptacle near the close of the operation.

How the Gaseous Exchanges are Effected in Respiration.

For the purposes of description, and in reference exclusively to its respiratory function, the blood may be looked upon as a watery solution of certain substances having respectively a slight chemical attraction for oxygen and for carbon dioxide. The chief of these substances is hæmoglobin, which is concerned solely with the oxygen; others, less perfectly known, are concerned with the carbon dioxide, and include certain saline constituents of the plasma (NaHCO₃)¹ and perhaps also certain constituents of the corpuscles. The affinity of these substances for oxygen and carbon dioxide respectively is of so slight a nature that the mere exposure of the substances to a vacuum at a certain moderate temperature is sufficient to overcome the affinity, and dissociate the captive gases. Granted such a solution in the blood-vessels of the lungs, separated from the air of the air cells by the thin moist membranes of the alveolar walls, how are the gaseous exchanges of respiration brought about? In the first place we must premise certain physical relationships which exist between gases and fluids in contact with one another. If a definite quantity of pure water be exposed to the air it will at a given temperature dissolve a definite volume of air. If the air be compressed to one-half (or one-quarter) of its original bulk the water will still absorb the same volume of it, albeit that volume now contains twice (or four times) the former quantity of gas. If the pressure be diminished again the air will escape from the water exactly in proportion to the diminished pressure. This is a concrete example of Dalton's law that the quantity of a gas dissolved by a liquid varies directly as the pressure of the gas at the surface of the liquid. What is true of the air is true of its constituents. In the above example the quantity of the constituent oxygen absorbed after the compression of the air is twice (or four times) the quantity absorbed before compression. But the quantity which is absorbed of any constituent of a gaseous mixture depends, not upon the total pressure exerted on the liquid by all the gases of the mixture in contact with its surface, but by the partial pressure, or fraction of the total pressure, exerted by the constituent in question. To take an example, let us suppose that a solution of oxygen in water made at a certain definite pressure is exposed to an atmosphere of pure nitrogen exerting as great a pressure, or even a greater, on the surface of the liquid; notwithstanding this pressure the oxygen would escape from solution as readily as if the solution had been placed in a perfectly vacuous space. If water be exposed in a certain space of air (which is, roughly, a mixture of nitrogen and oxygen), the oxygen which it is capable of absorbing would be

FIG. 11.—Pump for extracting gases of the blood. *a*, filling-globe; *b*, barometer bulb; *d*, three-way stopcock (B C D, the same enlarged, A, its plug); *e*, gas-delivery tube; *f*, mercurial gauge; *g*, drying apparatus, containing sulphuric acid; *h*, froth-chamber; *i*, bulb in which the blood is boiled.

nevertheless to a small extent in a state of loose chemical combination in which both plasma and corpuscles share. The nitrogen is held in a state of simple solution in the liquor sanguinis. These gases are yielded in different proportions by arterial and venous blood, as is shown in the following table:—

¹ In a vacuum 2HNaCO₃ splits up into Na₂CO₃ + CO₂ + H₂O.

equally well absorbed if all the nitrogen were removed from the space and the oxygen alone left to fill it. These remarks are equally true of a liquid separated from a gas by moist membranes. In short, the blood of the pulmonary vessels, regarded as a simple liquid capable of absorbing O and CO₂, and apart from the remarkable chemical bodies contained in it, obeys Dalton's law like any other liquid.

The blood is, however, not a simple fluid, but contains substances having a peculiar affinity for certain of the gases of the atmosphere; especially does it contain hæmoglobin. It has been stated that the "dissociable" or "respiratory" oxygen of oxyhæmoglobin is all yielded to a vacuum at the temperature of the body. This yield differs from the yield of a gas simply dissolved in a liquid (which also is perfect in a vacuum) in not proceeding *pari passu* as the pressure approaches *nil*. On the contrary in the case of solutions of hæmoglobin, as the oxygen pressure is diminished at the surface of the solution, no changes occur in the oxyhæmoglobin until the oxygen pressure reaches 25 mm. (about 1 inch) of mercury; then the oxyhæmoglobin yields up its respiratory oxygen. If the steps are retraced, and oxygen is gradually readmitted to exercise pressure upon the hæmoglobin solution, the latter takes up oxygen once more as soon as the oxygen pressure reaches or exceeds 25 mm. of mercury.

We may now consider the actual physical conditions of the blood in the lungs. Venous blood is hurried into the capillaries surrounding the air cells; much of its hæmoglobin has been "reduced" (or deprived of its dissociable oxygen), and further it is rich in carbon dioxide, which it has obtained from the active tissues in distant organs. In the alveolar walls it comes into relationship with the air of the alveoli; probably these are filled with air which never contains less than 10 per cent. of oxygen, and which (in the dog, be it remembered) contains 3·8 per cent. of CO₂ at a time when the expired air contains 2·8 per cent. Are these conditions such that, owing to the physical laws described, oxygen must pass into the blood, and carbon dioxide out of it? First, as regards the oxygen. An atmosphere containing 10 per cent. of oxygen implies a partial O-pressure of 76 mm. of mercury (10 per cent. of 760 mm.); as this is far above the dissociation point (25 mm.) of oxyhæmoglobin, it is clear that any reduced hæmoglobin present would greedily absorb oxygen from such an atmosphere. When the air breathed is much rarefied, the case is different; the partial O-pressure in the alveoli may be so far reduced that the absorption of O by the blood becomes most difficult or impossible. As regards the carbon dioxide the matter is not so clear; but, inasmuch as air drawn from the depth of the lung by means of a catheter contains (in a dog) 3·8 per cent. of CO₂, while at the same time the venous blood of the right side of the heart possesses a CO₂ tension of approximately the same percentage, we may assume that CO₂ escapes from the pulmonary capillaries into the alveoli until equilibrium ensues. It is, however, conceivable that the epithelium of the air cells may assist the elimination of CO₂ from the blood by a process of true excretion independently of the above merely physical considerations.

So-called Internal Respiration.

Venous blood yields up its carbon dioxide and takes up oxygen in the capillaries of the lungs; arterial blood passes to the general capillaries of the tissues and there yields up its oxygen and receives carbon dioxide. To this act, which in its issues is complementary to the interchanges of pulmonary respiration, the term internal respiration, or respiration of the tissues, has been applied. With as much propriety we might speak of internal urination in reference to the nitrogenous effete matters which the tissues

cast into the blood. We are in fact not in a position to form any clear picture of the interchanges which occur between the blood and the tissues other than that which is sketched under NUTRITION (vol. xvii. pp. 678-682). Muscle is the tissue whose metabolic processes are most clearly understood. Living muscle yields no oxygen to a vacuum, although it gives up carbon dioxide freely; therefore it is presumably itself in a condition to take up oxygen from arterial blood and to give up carbon dioxide to it. But the absorption of oxygen is not *immediately* necessary to the escape, or the formation, of the carbon dioxide, however much it is so in the last instance. In other words, the oxygen passes into the tissue and is at once combined into some intermediate compound which only at a later stage decomposes and yields carbon dioxide. Whenever an organ is active its blood-vessels dilate and permit a more copious flow of blood through it than when it is at rest. In the salivary glands the blood may even pulsate in the veins and look like true arterial blood in colour. After passing through active muscles the blood contains both more CO₂ and less O than after passing through resting muscle.

Dyspnœa and Asphyxia.

When the entrance of air to the lungs is entirely prevented the phenomena of dyspnœa and asphyxia begin to appear. At first respiration is deeper and more frequent than usual (dyspnœa), the extraordinary muscles being called into play in both inspiration and expiration; the heart beats more quickly at first, but afterwards more slowly; this is the *first stage*. It is succeeded by the *second stage*, in which the violence of respiration is less marked, although the coordination of the act is more irregular; indeed towards the end of the stage respiratory movements merge in general convulsions of the whole body. Throughout this stage expiration is more marked than inspiration, and the pressure of the blood in the blood-vessels is very great. The *third stage* is one of exhaustion, which supervenes suddenly, and is marked by loss of consciousness, dilated pupils, and absence of the powers of reflex action. The animal seems dead, except that at long intervals feeble inspiratory gasps occur. Finally there comes one great inspiratory effort: the mouth is fixed wide open, the head thrown back, the body arched backwards, the nostrils dilated, and the pulse after a second or two is indistinguishable (asphyxia). The whole series of events lasts from three to five minutes if the interruption to the entrance of air has been absolute. After death the right side of the heart, with the vessels immediately opening into it, viz., the venæ cavæ and veins of the neck and the pulmonary artery, are engorged with black blood containing little or no oxyhæmoglobin. The left side of the heart and the systemic arteries are contracted and empty. All these phenomena are best explained by the known power of venous blood to stimulate the nervous centres. As the blood becomes more and more venous it stimulates more powerfully the great nerve-centres of the medulla oblongata. The respiratory centre is stimulated, especially its expiratory portion; and, finally, the whole muscular centres of the spinal system are excited, causing general convulsions. The vaso-motor centre is stimulated, causing the rise of blood pressure in the early stage. The slowing of the heart during the close of the first and second stages is due to stimulation of the vagus cardio-inhibitory centre in the medulla. Finally the centres become exhausted from the impurity of the blood bathing them, and their activity fails altogether.

Stimulation of the Respiratory Centre.

It remains to ask what property of venous blood confers upon it the power of stimulating nerve centres. Venous

blood differs from arterial blood chiefly in the relative amounts of O and CO₂ it contains. Which of these substances is it whose deviation from the arterial standard causes stimulation? It so happens that we can experimentally separate the two factors. If an animal be placed in a chamber of some inert gas, such as nitrogen, the escape of CO₂ from the lungs is unimpeded and no accumulation of CO₂ in the blood is brought about; nevertheless dyspnoea and asphyxia follow as if the entrance of air to the windpipe had been interrupted. Here there is no accumulation of CO₂ in the blood, but total deficiency of O. On the other hand, if an animal be placed in a chamber containing a large excess of CO₂ beyond the standard of expired air, but at the same time a superabundant supply of O, no dyspnoea supervenes, and no asphyxia threatens. The animal may suffer from drowsiness (for CO₂ is narcotic in its effects), but true dyspnoea never occurs so long as the supply of O is sufficient. There is little doubt therefore that the absence of O from venous blood is the essential condition of its stimulating property.

Diversity of Modes in which the Function is Carried on.

Respiration, if we assume the essential fact of that process to be the absorption of O and the elimination of CO₂ by the animal body, is coextensive with the whole

animal kingdom. It is not, however, in every case served by special air-containing organs or lungs. Indeed the essential interchange of respiration goes on wherever the blood comes into sufficiently close contact with oxygen. For example, the air which happens to be swallowed with our food is so closely in contact with the blood of the intestinal vessels that an interchange of gases occurs, constituting a true intestinal respiration. The *Mammalia* all possess true lungs. In birds also there are lungs, but the mechanism of respiration is unlike that of man, since the diaphragm is wanting. There are, in birds, besides lungs, "air sacs" lying among the viscera and communicating with cavities in the bones, these sacs being supplied with air from the lungs. Reptiles and some amphibians breathe by lungs, other amphibians breathe by gills, as also do the young of some of the air-breathing *Amphibia* (frogs). Fishes breathe by gills, using the O dissolved in water.

Many invertebrates respire in air, which is carried into the midst of their tissues in tracheæ or air-tubes branched like a tree; other invertebrates breathe by gills in water; others again have lungs. In some the oxygenized water is carried into the body along a series of tubes—the water-vascular system; and in still simpler animals the general surface of the body seems to serve the respiratory function. (A. G. *)

RESTIF, NICOLAS EDME (1734–1806), called RESTIF DE LA BRETONNE (the form RETIF, though occasionally used by the author himself, and adopted by M. Monselet, has the less authority), was born at Sacy in the present department of the Yonne, France, on 23d October 1734. His father was a farmer of not the lowest rank, and the vanity of Restif has preserved or invented an extraordinary genealogy (supposed to date from his grandfather's time) in which the family is traced to the Roman emperor Pertinax. This Restif did not take very seriously, but he is himself almost the only authority for the details of his own career, which he has voluminously recorded, and these details are in part so incredible, in part so obviously distorted by various motives, that it is very hard to do more than discover the general outline of his life. He was well educated—partly if not chiefly by his own devotion to books—he was apprenticed to a printer at Auxerre, and, having served his time, went to Paris. Here he worked as a journeyman printer for some time (indeed he continued his manual work for the greater part of his life), and in 1760 he married Anne or Agnes Lebègue, a relation of his former master at Auxerre. He soon tired of her, and has left the most unfavourable pictures of her morals and temper. In the early years of their married life they were but little together, and for the last twenty they never saw each other; but Restif's own account is sufficient to show that certainly not all, and probably very few, of the faults were on the wife's side. It was not till five or six years after his marriage that Restif, who by his own account had written voluminously from his earliest youth but had published nothing, appeared as an author, and from that time to his death on February 2, 1806, he produced a bewildering multitude of books (amounting to something like two hundred volumes, and many of them printed with his own hand) on almost every conceivable variety of subject. The most noteworthy are *Le Pied de Fanchette*, a novel (1769); *Le Pornographe* (same date), a plan for regulating prostitution which is said to have been actually carried out by the emperor Joseph II., while not a few detached hints have been adopted by Continental nations; *Le Paysan Perversi* (1774), a novel in which much of his own experience is worked in;

La Vie de Mon Père (1779), a really remarkable monument of filial piety; *Les Contemporaines* (42 vols., 1780–85), a vast collection of short stories showing at once Restif's fertility of invention, his narrative faculty, and his accurate observation of the manners of Paris; *Ingénue Savanacour*, also a novel (1789); and, lastly, the extraordinary autobiography of *Monsieur Nicolas* (16 vols., 1794–97; the last two are practically a separate and much less interesting work), in which at the age of sixty he has set down voluminously his remembrances, his notions on ethical and social points, his hatreds, and above all his numerous or innumerable loves real and fancied. The original editions of these, and indeed of all his books, have long been bibliographical curiosities owing to their rarity, the beautiful and curious illustrations which many of them contain, and the quaint typographic system in which most are composed. The author's life during this long period was a singular mixture of hard work and perpetual falling in love. He seems to have really seen society of the most varied kind, though in this as in all other matters he certainly exaggerates and perhaps invents in a way which makes it impossible to discern the exact truth. Some of his books sold well, and, as has been said, he was always industrious as an author or a printer and sometimes as both. But he had repeated losses, and though never in actual want was never in easy circumstances. He was arrested once during the Revolution but had no difficulty in getting off; indeed he seems to have been a convinced republican. In 1795 he received a gratuity of 2000 francs from the Government, and just before his death Napoleon gave him a place in the ministry of police, which he did not live to take up. After his death Cubières Palmeaux, a gentleman literary-hack of the day, wrote his life.

Restif de la Bretonne undoubtedly holds a remarkable place in French literature, though the rarity and curious character of his books have sometimes induced his editors and commentators to take too high a view of his merits. He was inordinately vain, of extremely relaxed morals, and perhaps not entirely sane. His books were written with such haste and in such bulk that they can only be praised with great allowance. Their licence of subject and language renders some if not most of them quite unfit for general perusal. But when every deduction is made there will remain on a just estimate the facts that Restif had a singular and profound knowledge of the human heart (the second title of his *Monsieur*

Nicolas is *Le Cœur Humain Dévoilé*), that among his random and often chimerical speculations on social, ethical, and political matters thoughts of extraordinary justness now and then occur, that his observation of manners was keen, and that his narrative faculty, at least in short tales and detached passages, was exceptionally good.

Original editions of Restif are, as has been said, bibliographical curiosities. The works of Ch. Monselet (1853) and P. Lacroix (1875), Assézat's selection from the *Contemporaines*, with excellent introductions (3 vols., 1875), and the valuable reprint of *Monsieur Nicolas* (14 vols., 1883-84), will be sufficient to enable even curious readers to form a judgment of him. The selection from the *Contemporaines* preserves Restif's curious printing and spelling.

RESTOUT, JEAN (1692-1768), French painter, born at Rouen, March 26, 1692, was the son of Jean Restout, the first of that name, and of Marie M. Jouvenet, sister and pupil of the well-known Jean Jouvenet. Jean Restout's father died young, and his son was placed at Paris with his uncle Jean Jouvenet. In 1717, the Royal Academy having elected him a member on the work which he had executed for the Great Prize, he remained in Paris, instead of proceeding to Italy, exhibited at all the salons, and filled successively every post of academical distinction. He died on January 1, 1768. He left several pupils, none of whom were of great distinction. His works, chiefly of vast size—altarpieces (Louvre Museum), ceilings, designs for Gobelin tapestries—were much engraved by Cochin, Drevet, and others; his diploma picture may still be seen at St Cloud.

RESTOUT, JEAN BERNARD, son of the above, was born at Paris, February 22, 1732, and died in the same city on July 18, 1797. In 1758 he won the Great Prize, and on his return from Italy was received into the Academy; but his refusal to comply with rules led to a quarrel with that body which alienated him from his profession. Roland brought him into notice by appointing him keeper of the Garde Meuble, but this piece of favour nearly cost him his life during the Terror: he was cast into prison and was only saved from the guillotine by the reaction of Thermidor. The St Bruno painted by him at Rome is in the Louvre.

RETFORD, EAST, a market town and borough of Nottinghamshire, is situated on the Idle and on the Great Northern and Manchester, Sheffield, and Lincolnshire Railways, 36 miles north-east of Nottingham by rail, and eight south-west of Gainsborough. The church of St Swithin, a large cruciform structure with a square embattled tower, dates from the 13th century, but was rebuilt in 1658 by a brief granted by Richard Cromwell. Among the modern buildings are the town-hall, the corn exchange, the court-house, and the covered markets. There is a large trade in corn, cheese, and hops, and the town possesses iron foundries, paper and corn mills, and india-rubber works. The population of the municipal borough in 1871 was 3194, but in 1878 the area was extended to 4532 acres, and in 1881 the population was 9748.

The town derives its name from an ancient ford over the Idle. In Domesday it is written *Redeford*, and early in the 13th century it is called *Este Reddfurthe*. It is a borough by prescription, and was granted in 1279 to the burgesses by Edward I. at a fee farm rent of £10, with the right of choosing a bailiff. Its rights were confirmed and extended by Edward III., Henry IV., and James I. It sent two members to parliament in the reign of Edward I., but the privilege was dormant from 1330 to 1571. The parliamentary borough, which was largely rural, having been extended in 1829 to include the whole wapentake of Bassetlaw, and comprising 207,906 acres in 1881, ceased to exist as a borough in 1885. The municipal borough is divided into three wards, and is governed by a mayor, six aldermen, and eighteen councillors.

RETHEL, ALFRED (1816-1859), historical painter, was born at Aix-la-Chapelle in 1816. He very early showed an interest in art, and at the age of thirteen he executed a drawing which procured his admission to the academy of Düsseldorf. Here he studied for several years, and produced, among other works, a figure of St Boniface which attracted much attention. At the age of twenty he removed to Frankfort where he studied under Philip Veit;

and, having, in common with so many of the German artists of the period, manifested an aptitude for fresco-painting, he was selected to decorate the walls of the imperial hall in the Römer with figures of famous men. At the same period he produced a series of designs illustrative of Old Testament history. Four years later he was the successful competitor for the work of ornamenting the restored council house of his native city with frescos depicting prominent events in the career of Charlemagne, but various discussions and delays prevented the execution of this work for some six years. Meanwhile Rethel occupied himself with the production of easel pictures, and of drawings; and in 1842 he began a most striking and important series of designs dealing with the Crossing of the Alps by Hannibal, in which the weird power which animates his later art becomes first apparent. In 1844 Rethel visited Rome, occupying his time both in study and in production, and executing, along with other subjects, an altarpiece for one of the churches of his native land. In 1846 he returned to Aix, and commenced his Charlemagne frescos. But the strain of production, aggravated by a lack of sympathy, and by vexatious delays and interferences, produced a most injurious effect upon both the health and the spirits of the artist. Symptoms of mental derangement, remotely attributable, it is believed, to an accident from which he suffered in childhood, began to manifest themselves in strange and groundless suspicions against his friends and brother artists. While he hovered between madness and sanity, "with a mind"—as Mr Ruskin has said in reference to the very parallel case of William Blake—"disturbed, but not deceived, by its sickness, nay, partly exalted by it," Rethel produced some of the most striking, individual, and impressive of his works. Strange legends are told of the effect produced by some of his weird subjects. He painted Nemesis pursuing a Murderer—a flat stretch of landscape, with a slaughtered body relieved against the flushing evening sky, while in front is the assassin speeding away into the darkness, clutching his blood-stained knife, thorns and thistles springing up around his path, and above, hovering over his head, with unhasting but ceaseless flight, an angel of vengeance, holding an hour-glass from which the last sands are escaping, and a sword which is slowly descending upon the fated head. The picture, so the story goes, was won in a lottery at Frankfort by a personage of high rank, who had been guilty of an undiscovered crime, and the contemplation of his prize drove him to distraction, and he became a lunatic. Another design which Rethel executed was *Death the Avenger*, a skeleton appearing at a masked ball, scraping daintily, like a violinist, upon two human bones. The drawing haunted the memory of his artist friends and disturbed their dreams; and, in expiation, he produced his pathetic design of *Death the Friend*, a skeleton draped in long monk's robes, tolling solemnly the passing bell in a church tower, while beside the open window, lit by the last sunset radiance, sits an old sexton, with the peaceful face of a quiet departure. Rethel also executed a powerful series of drawings—the *Dance of Death*—suggested by the Belgian insurrections of 1848. It is by such designs as these, executed in a technique founded upon that of Dürer, and animated by an imagination akin to that of the elder master, that Rethel is most widely known. Certainly his fame can rest very securely upon such works as *Death the Avenger* and *Death the Friend*,—those "inexpressibly noble and pathetic wood-cut grotesques," as Mr Ruskin has so justly styled them. Rethel died at Düsseldorf on December 1, 1859.

His picture of Peter and John at the Beautiful Gate of the Temple, is preserved in the Leipsic Museum, and his St Boniface and several of his cartoons for the frescos at Aix in the Berlin National Gallery. His life by Wolfgang Müller von Königswinter has been published. See also *Art Journal*, November 1866.

RETZ, JEAN FRANÇOIS PAUL DE GONDI, CARDINAL DE (1614–1679), was born at Montmirail in 1614. The family was one of those which had been introduced into France by Catherine de' Medici, but it had acquired great estates in Brittany and had been connected with the noblest houses of the kingdom. It may be added that Retz himself always spelt his designation "Rais," and the spelling is not inconvenient for foreigners. He was the third son, and according to Tallemant des Réaux was made a knight of Malta on the very day of his birth. The death of his second brother, however, destined him for a closer connexion with the church. The family of Retz had military traditions, for the cardinal's father, Philippe Emmanuel, was general of the galleys, and his grandfather Albert was marshal of France. But it had also much church influence, Retz's uncle being archbishop of Paris, and, despite the very unclerical leanings of the future cardinal, which were not corrected by the teachings of St Vincent de Paul, who was his tutor, the intentions of his family never varied respecting him. It was in vain that, as he has recounted with some vanity in his famous memoirs, he flirted, fought duels, and endeavoured in every way to show that he had no vocation. His friends might have some excuse for doubting his aptitude for a more active career despite his vivacious temperament, for by unanimous consent his physical appearance was not that of a soldier. He was short, near-sighted, ugly (though his ugliness had much in common with that of Wilkes), and exceptionally awkward of hand and gesture. Retz, however, despite the little inclination which he felt towards clerical life, was not a man to leave any kind of career to which he had access untried. He entered into the disputes of the Sorbonne with vigour, and when he was scarcely eighteen wrote the remarkable *Conjuration de Fiesque*, a little historical essay of which he drew the material from the Italian of Mascardi, but which is all his own in the negligent vigour of the style and the audacious insinuation, if nothing more, of revolutionary principles. It is said, though the anecdotes of this time are always suspicious, that Richelieu's verdict after reading the pamphlet was "voilà un homme dangereux." However this may be, Retz received no preferment of importance during Richelieu's life, and even after the minister's death, though he was presented to Louis XIII. and well received (the king offered him a bishopric), he found a difficulty in attaining the object of his wishes, that is to say, the coadjutorship with reversion of the archbishopric of Paris. But almost immediately after the king's death Anne of Austria appointed him to the coveted post on All Saints' Eve, 1643. Retz, who had according to some accounts already plotted against Richelieu, set himself to work to make the utmost political capital out of his position. His uncle, who was old, indolent, and absurdly proud, had lived in great seclusion; Retz, on the contrary, by assiduously cultivating the parish *curés* and distributing large sums in alms, gradually acquired a very great influence with the populace of the city. This influence he gradually turned against Mazarin—partly from the general dislike which the French nobles had to that low-born adventurer, but partly also, it would appear, because he himself was not in Mazarin's place. No one had more to do than Retz with the outbreak of the Fronde in October 1648, and his history for the next four years is the history of that confused and, as a rule, much misunderstood movement. Of the two parties who, sometimes in union and sometimes at variance with each other, opposed the system of absolute monarchy carried on by an omnipotent minister, Retz could only depend on the bourgeoisie, not on the nobles, and even in the case of the bourgeoisie he had little influence out of Paris. The fact, more-

over, that although he had some speculative tendencies in favour of popular liberties, and even perhaps of republicanism, he represented no real political principle, as the parliament of Paris did and as did great nobles like La Rochefoucauld, inevitably weakened his position. His adroitness of intrigue and his boldness in action (which was even shown on the field of battle) served him little in the long run, and when the break up of the Fronde came he was left in the lurch, having more than once in the meanwhile been in no small danger from his own party. One stroke of luck, however, fell to him before his downfall. He was made cardinal almost by accident, and under a misapprehension on the pope's part. Then, in 1652, he was arrested and imprisoned, first at Vincennes, then at Nantes; he escaped, however, after two years' captivity, and for some time wandered about in England and elsewhere. He made his appearance at Rome more than once, and had no small influence in the election of Alexander VII. He was at last, in 1662, received back again into favour by Louis XIV. and on more than one occasion formally served as envoy to Rome,—commissions which have left abundant records in the shape of official documents. Retz, however, was too shrewd, and perhaps too weary of political intrigue to attempt any interference with the new order of things at home, and he was glad in making his peace to resign his claims to the archbishopric of Paris. The terms were, among other things, his appointment to the rich abbacy of St Denis and his restoration to his other benefices with the payment of arrears.

The last seventeen years of Retz's life were comparatively quiet, and were passed partly in his diplomatic duties (he was again in Rome at the papal election of 1668), partly at Paris, partly at his estate of Commercy, but laterly at St Mihiel in Lorraine. His retirement to this place was made under circumstances which were unusual for the age. His debts were as enormous as his revenues were large, and, as the latter were almost entirely derived from ecclesiastical appointments, his creditors had no remedy. In 1675 he resolved to make over to them all his income except twenty thousand livres, and, as he said, to "live for his creditors." This plan he carried out, though he did not succeed in living very long, for he died at Paris on the 24th August 1679. One of the chief authorities for the last years of Retz is Madame de Sévigné, whose connexion he was by marriage. Great friendship existed between them, and the cardinal was especially devoted to Madame de Grignan, who seems to have treated him with her usual selfish indifference.

Retz and La Rochefoucauld, the greatest of the Frondeurs in literary genius, were personal and political enemies, and each has left a portrait of the other. La Rochefoucauld's character of the cardinal is on the whole harsh but scarcely unjust, and one of its sentences formulates, though in a manner which has a certain recoil upon the writer, the great defect of Retz's conduct,—"*Il a suscité les plus grands désordres dans l'état sans avoir un dessein formé de s'en prévaloir.*" The last two words indicate but too clearly the self-seeking which was the bane of the Fronde and of the French noblesse generally. But it is perfectly true that no general design of benefiting either himself or his country, or even any party or order in his country, can be traced in Retz's conduct, and that he seems to have kindled the fires of civil war in pure gaiety of heart. He would have been less, and certainly less favourably, remembered if it had not been for his *Memoirs*, which, with Madame de Sévigné's notices, give a rather high idea of the amiability of his character at the same time that they confirm its levity, and above all prove his possession of remarkable literary faculty. They were

certainly not written till the last ten years of his life, and they do not go further than the year 1655. They are addressed in the form of narrative to a lady who is not known, though guesses have been made at her identity. In the beginning there are some gaps. They display, in a rather irregular style and with some oddities of dialect and phrase, extraordinary narrative skill and a high degree of ability in that special art of the 17th century—the drawing of verbal portraits or characters. Few things of the kind are superior to the sketch of the early barricade of the Fronde in which the writer had so great a share, the hesitations of the court, the bold adventure of the coadjutor himself into the palace, and the final triumph of the insurgents. Dumas, who has drawn from this passage one of his very best scenes in *Vingt Ans après*, has done little but throw Retz into dialogue and amplify his language and incidents. Besides these memoirs and the very striking youthful essay of the *Conjuration de Fiesque*, Retz has left diplomatic papers, sermons, Mazarinades, and correspondence in some considerable quantity.

The *Memoirs* of the Cardinal de Retz were first published in a very imperfect condition in 1717 at Nancy. The first satisfactory edition was that which appeared in the twenty-fourth volume of the collection of Michaud and Poujoulat (Paris, 1836). They were then re-edited from the autograph manuscript by Gêruzez (Paris, 1844), and by Champollion-Figeac with the Mazarinades, &c. (Paris, 1859). In 1870 a complete edition of the works of Retz was begun by M. Feillet in the collection of *Grands Écrivains*. The editor dying, this passed into the hands of M. Gourdault and then into those of M. Chantelauze, who had already published studies on the connexion of St Vincent de Paul with the Gond family, &c. The edition is still incomplete, and the critical biography of Retz which it may be expected to contain is much wanted. (G. SA.)

REUBEN (רֵעֹבֶן, 'Ρουβήν, 'Ρουβίν), eldest son of Jacob and of Leah (Gen. xxix. 32). Reuben plays no great part in the patriarchal legend; in the Elohist version of the story of Joseph he appears in a somewhat favourable light, but in Gen. xxxv. 22 he is charged with a grave offence, which in Gen. xlix. 4 is given as a reason why the tribe which called him father did not take in Hebrew history the place proper to its seniority. The Reubenites settled east of the Jordan on the Moabite border. In Judges v. they are described as a pastoral tribe which took no share in the patriotic movement under Barak and Deborah. The Moabites soon proved too strong for them (comp. MOAB, vol. xvi. p. 534) and overspread their country (comp. Isa. chap. xv. sq. with Josh. xiii. 16 sq.); in Deut. xxxiii. 6 the tribe appears as threatened with extinction. Dathan and Abiram (Num. xvi., Deut. xi. 6), whom the earth swallowed up for rebellion against Moses, were Reubenites. After this time only the book of Chronicles has anything considerable to relate of the tribe (1 Chron. v. 1 sq., 18 sq.).

REUCHLIN, JOHN (1455–1522), the first great German humanist and the restorer of Hebrew and in large measure also of Greek letters among his countrymen, was born February 22, 1455, at Pforzheim in the Black Forest, where his father was intendant of the Dominican monastery. In the pedantic taste of his time the name was Græcized by his Italian friends into Capnion, a form which Reuchlin himself uses as a sort of transparent mask when he introduces himself as an interlocutor in the *De Verbo Mirifico*. For his native place Reuchlin always retained an affection; he constantly writes himself Phorcensis, and in the *De Verbo*, when he tells how he had sojourned at Paris and almost all the great schools of France and Germany, as well as at several Italian seats of learning and finally at Rome, the "caput studiorum," he does not forget to ascribe to Pforzheim his first disposition to letters. Here he began his Latin studies in the monastery school, and, though in 1470 he was a short time in Freiburg,

that university seems to have taught him little. Reuchlin's career as a scholar appears to have turned almost on an accident; his fine voice gained him a place in the household of the margrave of Baden, and by and by, having already some reputation as a Latinist, he was chosen to accompany to the university of Paris the third son of the prince, a lad some years his junior, who was destined for an ecclesiastical career. This new connexion lasted but a year or so, but it determined the course of Reuchlin's life. He now began to learn Greek, which had been taught in the French capital since 1470, and he also attached himself to the leader of the Paris realists, John à Lapide, a really worthy and learned man, whom he presently followed to the vigorous young university of Basel (1474). At Basel Reuchlin took his master's degree (1477), and began to lecture with success, teaching a more classical Latin than was then common in German schools, and also explaining Aristotle in Greek. His studies in this language had been continued at Basel under Andronicus Contoblacas, and here too he formed the acquaintance of the bookseller Amorbach, for whom he prepared a Latin lexicon (*Vocabularius Breviloquus*, 1st ed. 1475–76), which did good service in its time and ran through many editions. This first publication and Reuchlin's account of his teaching at Basel in a letter to Cardinal Hadrian, February 1518, show that he had already found the work which in a larger sphere occupied his whole life. He was no original genius, but a born teacher. He had neither brilliant literary power like Erasmus nor epoch-making ideas like Luther, but he was the great master of all Germany, guiding his countrymen to sound learning, first in Latin and then in Greek and in Hebrew. But this work of teaching was not to be done mainly from the professor's chair. Reuchlin soon left Basel to seek further Greek training with George Hieronymus at Paris, and learn to write a fair Greek hand that he might support himself by copying MSS. And now he felt that he must choose a profession. His choice fell on law, and he was thus led to the great school of Orleans (1478), and finally to Poitiers, where he became licentiate in July 1481, and so could look forward to honourable office in his native country, where he could pursue his scholarly tastes in an independent position. From Poitiers Reuchlin came in December 1481 to Tübingen. There he found friends to recommend him to Count Eberhard of Würtemberg, who was about to journey to Italy and required an interpreter. Reuchlin was selected, and in February 1482 left Stuttgart for Florence and Rome. The journey lasted but a few months, but it brought the German scholar into contact with several learned Italians, and his connexion with the count became permanent. On his return to Stuttgart he was named Geheimrath, and soon after he became doctor of laws and assessor in the high court. About this time he appears to have married, but little is known of his married life. He left no children; but in later years his sister's grandson Melanchthon was almost as a son to him till the Reformation estranged them. Reuchlin's life at Stuttgart was often broken by important missions, and in 1490 he was again in Italy. Here he saw Pico, to whose Cabbalistic doctrines he afterwards became heir, and also made the friendship of the pope's privy secretary, Questenberg, which was of service to him in his later troubles. Again in 1492 he was employed on an embassy to the emperor at Linz, and here he began to read Hebrew with the kaiser's Jewish physician Loans. He knew something of this language before, but Loans's instruction laid the basis of that thorough knowledge which he afterwards improved on his third visit to Rome in 1498 by the instruction of Obadiah Sforza of Cesena.

In 1496 Count Eberhard died, and enemies of Reuchlin had the ear of the new prince. He was glad therefore hastily to follow the invitation of John of Dalburg the scholarly bishop of Worms, and flee to Heidelberg, which was then the seat of the "Rhenish Society," a lively and active circle of humanists under Dalburg's presidency, equally zealous in the service of Apollo and Bacchus. In this court of letters Reuchlin's appointed function was to make translations from the Greek authors, in which his reading was already extremely wide. Many of these versions were never printed, but a considerable number of pieces were given to the press at intervals down to the year 1519, and formed an important element in his efforts to spread a knowledge of Greek. For, though Reuchlin had no public office as teacher, and even at Heidelberg was prevented from lecturing openly, he was during a great part of his life the real centre of all Greek teaching as well as of all Hebrew teaching in Germany. No young man of promise who came to him for help was rejected; he taught many and found teachers for others, or gave direction and solution of difficulties to more advanced scholars. Thus he was a sort of unofficial general director of the studies of Germany, and to carry out this work he found it necessary to provide a series of helps for beginners and others. He never published a Greek grammar, though he had one in MS. for use with his pupils, but he put out several little elementary Greek books; and these with the series of translations were in fact the text books of the German youth. Reuchlin, it may be noted, pronounced Greek as his native teachers had taught him to do, i.e., in the modern Greek fashion. This pronunciation, which he defends in *Dialogus de Recta Lat. Græcique Serm. Pron.*, 1519, came to be known, in contrast to that used by Erasmus, as the Reuchlinian.

At Heidelberg Reuchlin had many private pupils, among whom Franz von Sickingen is the best known name; and all his relations, except with the monks who stopped his attempt to lecture on Hebrew, were very pleasant. With the monks he had never been well; at Stuttgart also his great enemy was the Augustinian Holzinger. On this man he took a scholar's revenge in his first Latin comedy *Sergius*, a satire on worthless monks and false relics which his young Heidelberg friends were eager to act. But, Dalburg thinking this unsafe, he wrote for them a new piece, *Scenica Progymnasmata* or *Henno*, based on the old French play of *Maître Pathelin*, which is not without humour and sparkle of language, and much better constructed than the French piece.

Through Dalburg, Reuchlin came into contact with Philip of the Pfalz, who employed him to direct his son's studies, and in 1498 gave him the mission to Rome which has been already noticed as fruitful for Reuchlin's progress in Hebrew. He came back laden with Hebrew books, and found when he reached Heidelberg that a change of Government had opened the way for his return to Stuttgart. His wife had remained there all along; so that we may assume that he never looked on his exile as more than temporary. His friends were the party of order and good government, who could not long remain powerless. They had now again the upper hand, and knew Reuchlin's value. In 1500, or perhaps in 1502, he was named "triumvir of Swabia," a very high judicial office in the Swabian League, which he held till 1512, when he retired to a small estate near Stuttgart. By this time the long conflict which gives Reuchlin's life its chief interest had already begun.

For many years Reuchlin had been increasingly absorbed in Hebrew studies, which had for him more than a mere philological interest. Though he was always a

good Catholic, and even took the habit of an Augustinian monk when he felt that his death was near, he was too thorough a humanist to be a blind Catholic. He knew the abuses of monkish religion, and was interested in the reform of preaching (*De Arte Predicandi*, 1503—a book which became a sort of preacher's manual); but above all as a scholar he was eager that the Bible should be better known, and could not tie himself to the authority of the Vulgate. To him the Old Testament Scriptures meant the Hebrew text, and this he was determined to study with an independent love for truth: "I honour St Jerome as an angel; I value Lira as a master; but I worship truth as my God." The key to the *Hebraea veritas* was the grammatical and exegetical tradition of the mediæval rabbins, especially of Kimhi, and when he had mastered this himself he was resolved to open it to others. In 1506 appeared his *Rudimenta Hebraica*—grammar and lexicon—mainly after Kimhi, yet not a mere copy of one man's teaching. The edition was costly and sold slowly. In 1510 he was glad to offer Amorbach seven hundred and fifty copies at the reduced price of a florin for three copies. Even then Amorbach could hardly find purchasers, but Reuchlin bade him be patient, "for if I live Hebrew must with God's help come to the front." One great difficulty was that the wars of Maximilian in Italy prevented Hebrew Bibles coming into Germany. But for this also Reuchlin found help by printing the Penitential Psalms with grammatical explanations (1512), and other helps followed from time to time. But Reuchlin had yet another interest in Hebrew letters. His Greek studies had interested him in philosophy, and not least in those fantastical and mystical systems of later times with which the Cabbala has no small affinity. Following Pico, he seemed to find in the Cabbala a profound theosophy which might be of the greatest service for the defence of Christianity and the reconciliation of science with the mysteries of faith—an unhappy delusion indeed, but one not surprising in that strange time of ferment, when the old and the new intellectual life had not yet clearly discriminated themselves, and when men of progress sought less to free themselves from mere tradition than to find an ancient tradition of truth which had been lost in the darkness of mediæval ignorance. Reuchlin's mystico-cabbalistic ideas and objects were expounded in the *De Verbo Mirifico*, 1494, and finally in the *De Arte Cabbalistica*, 1517. We see therefore that not only the philological tradition but the most esoteric wisdom of the rabbins was in his eyes of the greatest value.

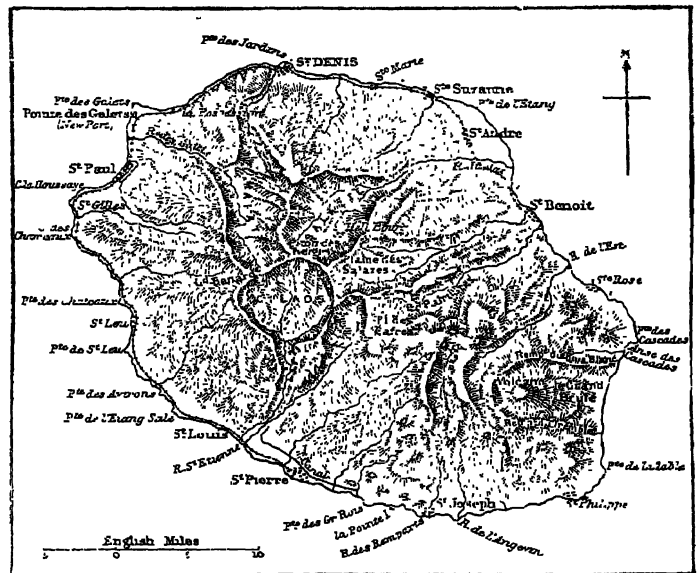

Unhappily many of his contemporaries held other views, and thought that the first step to the conversion of the Jews was to conquer their obstinacy by taking from them their books. This view had for its chief advocate the bigoted John Pfefferkorn, himself a baptized Hebrew. Pfefferkorn's plans were backed by the Dominicans of Cologne; and in 1509 he got from the emperor authority to confiscate all Jewish books directed against the Christian faith. Armed with this mandate, he visited Stuttgart and asked Reuchlin's help as a jurist and expert in putting it into execution. Reuchlin evaded this demand, mainly because the mandate lacked certain formalities, but he could not long remain neutral. The execution of Pfefferkorn's schemes led to difficulties and to a new appeal to Maximilian. It was resolved to call in the opinion of experts, and in 1510 Reuchlin was summoned in the name of the emperor to give his formal opinion on the suppression of the Jewish books. His answer is dated from Stuttgart, November 6, 1510; in it he divides the books into six classes—apart from the Bible which no one proposed to destroy—and, going through each class, he shows that the books openly insulting to Christianity are very

few and viewed as worthless by most Jews themselves, while the others are either works necessary to the Jewish worship, which was licensed by papal as well as imperial law, or contain matter of value and scholarly interest which ought not to be sacrificed because they are connected with another faith than that of the Christians. Instead of destroying a whole literature, which was what Pfefferkorn proposed, he proposed that the emperor should decree that for ten years there be two Hebrew chairs at every German university for which the Jews should furnish books. The other experts and all the universities consulted, except Heidelberg, proposed that all books except Bibles should be taken from the Jews to be investigated by a commission; and, as the emperor still hesitated, the bigots threw on Reuchlin the whole blame of their ill success. Pfefferkorn circulated at the Frankfurt fair of 1511 a gross libel (the *Handspiegel*) declaring that Reuchlin had been bribed; and Reuchlin, burning with the indignation of a man of unsullied integrity, retorted as warmly in the *Augenspiegel* (1511). His adversary's next move was to declare the *Augenspiegel* a dangerous book; the Cologne faculty, with their dean the grand inquisitor Hochstraten, took up this cry, and, encouraged perhaps by some signs of timidity in letters from Reuchlin to two of the Cologne theologians, they called on him to recant not a few dangerous utterances and misapplications of Scripture. Reuchlin was timid, but he was honesty itself. He was willing to receive corrections in theology, which was not his subject, but he could not unsay what he had said; and as his enemies tried to press him into a corner he at length turned and met them with open defiance in a *Defensio contra Calumniatores*, 1513. The universities were now appealed to for opinions, and were all against Reuchlin. Even Paris (August 1514) condemned the *Augenspiegel*, and called on Reuchlin to recant. Meantime a formal process had begun at Mainz before the grand inquisitor, but Reuchlin by an appeal succeeded in transferring the question to Rome. It is needless to follow the long windings of ecclesiastical process; judgment was not finally given till July 1516; and then, though the decision was really for Reuchlin, the trial was simply quashed. The result had cost Reuchlin years of trouble and no small part of his modest fortune, but it was worth the sacrifice. For far above the direct importance of the issue was the great stirring of public opinion which had gone forward. All who loved learning and progress were banded together as they had never been before against the bigots and the stupid universities; and all humanists felt that the victory was theirs. And if the obscurantists escaped easily at Rome, with only a half condemnation, they received a crushing blow in Germany. No party could survive the ridicule that was poured on them in the *Epistolæ Obscurorum Virorum*. Reuchlin did not long enjoy his victory in peace. In 1519 Stuttgart was visited by famine, civil war, and pestilence. From November of this year to the spring of 1521 the veteran statesman, whom the universal respect felt for his scholarship could not secure against the dangers involved in his political relations, sought refuge in Ingolstadt and taught there for a year as professor of Greek and Hebrew. It was forty-one years since at Poitiers he had last spoken from a public chair; but the old man of sixty-five had not lost his gift of teaching, and hundreds of scholars crowded round him. This gleam of autumn sunshine was again broken by the plague; but now he was called to Tübingen and again spent the winter of 1521-22 teaching in his own systematic solid way. But he was now in shaken health; in the spring he found it necessary to visit the baths of Liebenzell, and here he was seized with jaundice, of which he died 30th June 1522, leaving in the history of the new learning

a name only second to that of his younger contemporary Erasmus.

The authorities for Reuchlin's life are enumerated in L. Geiger, *Johann Reuchlin*, 1871, which is the standard biography. The controversy about the books of the Jews is well sketched by Strauss, *Ulrich von Hutten*. Some interesting details about Reuchlin are given in the autobiography of PELICANUS (*q. v.*), which was not published when Geiger's book appeared. (W. R. S.)

RÉUNION, formerly BOURBON, an island in the Indian Ocean, belonging to France and considered one of her more important colonies. St Denis, the capital, stands on the north side in 20° 51' S. lat. and 53° 9' E. long. Physically it may be described as the southmost subaerial summit of the great submarine ridge which, running north-east by Mauritius, Albatross Island, &c., and curving round by the Seychelles, connects with the platform of Madagascar at its north-eastern extremity. The great submarine valley which is thus enclosed between Madagascar and the Mascarene-Seychelles ridge has a depth of from 2000 to 2400 fathoms. In a straight line Réunion lies 115 miles from the east coast of Madagascar; and Mauritius, with which it communicates by optic signalling since 1882, is 115 miles to the north-east. The island has an area of 721,314 acres or 1127 square miles. It is usual to regard it as divided into a windward and a leeward district by a line, practically the watershed, running in the direction of the greater axis. The whole island is the result of a

Island of Réunion.

double volcanic action. First there arose from the sea a mountain whose summit is approximately represented by Piton des Neiges (10,069 feet), and at a later date another crater opened towards the east, which, piling up the mountain mass of Le Volcan, turned what was till then a circle into an ellipse 44 miles by 31. In the older upheaval the most striking features are now three areas of subsidence—the *cirques* of Salazie, Rivière des Galets, and Cilaos—which lie north-west and south of the Piton des Neiges and form the gathering grounds respectively of the Rivière du Mât, the Rivière des Galets, and the Rivière de St Etienne. The first, which may be taken as typical, is surrounded by high almost perpendicular walls of basaltic lava, and its surface is rendered irregular by hills and hillocks of debris fallen from the heights. Towards the south lies the vast stratum of rocks (150 to 200 feet deep) which, on the 26th November 1875, suddenly sweeping down from the Piton des Neiges and the Gros Morne, buried the little village of Grand Sable and nearly a hundred of its inhabitants. A considerable piece of ground, with its trees,

crops, and houses practically intact, along with the proprietor, who was seated at his own door, was carried a distance of nearly $1\frac{1}{2}$ miles. Along the whole eastern side of the cirque between the village of Salazie and Hellbourg is a series of waterfalls issuing at a great height from above a vast bank of lava. They are probably the overflow of a subterranean basin connected, it may be, with the sources, on the other side of the wall, of the Rivière du Bras de Caverne. At the source of the Rivière du Mât, which escapes from the cirque by a narrow and precipitous gorge, is a magnificent sheaf of basaltic columns boldly curving out over the bed of the torrent. Having climbed up the eastern side of the cirque, the traveller reaches the well-wooded plain of the Salazes; farther east, and separated from it by ridges of rock is the Plaine des Caffres at a height of 5250 feet above the sea, and by a descent of 1500 feet this dips north-eastward into the Plaine des Palmistes. The eastern summit or Piton de Fournaise is cut off from the rest of the island by two curious enclosures, each about 500 or 600 feet deep. The traveller approaching the present craters from the west has consequently to descend upwards of 1000 feet by two abrupt stages before he begins the ascent of the cones. The outer "enclosure" runs across the island in a north and south direction; but the inner forms a rude kind of parabola with its arms (Rempart du Tremblet on the south and Rempart du Bois Blanc on the north) stretching eastwards to the sea and embracing not only the volcano proper but also the great eastward slope known as the Grand Brûlé. There are two principal craters, each on an elevated cone,—the more westerly, now extinct, known as the Bory Crater after Bory de St Vincent, the eminent geologist, and the more easterly, simply called the Burning Crater or Fournaise. The latter is partially surrounded by an "enclosure" on a small scale with precipices 200 feet high. Eruptions, though not infrequent (thirty were registered between 1735 and 1860) are seldom serious; the more noteworthy are those of 1745, 1778, 1791, 1812, 1860, 1870, 1881. Basaltic or vitreous lavas rich in chrysolite are the usual products, and it is hardly possible to conceive of a discharge sufficient in volume to overflow the "ramparts" and carry destruction to the rest of the island.¹ Besides the Piton des Neiges (10,069 feet high), the Bory Peak (8612 feet), and the Burning Peak (8294), the principal summits in Réunion are the Grand Bénard (9490), Morne L'Angevin (7845), and Cimauf (7300). The streams which radiate out in all directions from the central highlands are for the most part comparatively small except during the rainy season, when they become impetuous and destructive torrents. Hot mineral springs are found in various parts of the island: the Source de Salazie (discovered in 1831) lies 2860 feet above sea-level, has a temperature of 90°, and discharges 200 to 220 gallons per hour of water impregnated with bicarbonate of soda, and carbonates of magnesium and lime, iron, &c.; that of Cilaos (discovered in 1826) is 3650 feet above the sea with a temperature of 100°; and that of Mafate 2238 feet and 87°. At the first there are a military hospital and a group of dwelling houses and villas.

Vertically Réunion may be divided into five zones. The first or maritime zone contains all the towns and most of the villages, built on the limited areas of level alluvium occurring at intervals round the coast (128 miles). In the second, which lies between 2600 and 4000 feet, the sugar planta-

tions make a green belt round the island and country houses abound. The third zone is that of the forests; the fourth that of the plateaus, where European vegetables can be cultivated; and above this extends the region of the mountains, which occupies more space than any of the others.

The following statements in regard to climate refer more particularly to the lower zones. The year divides into two seasons—that of heat and rain from November to April, that of dry and more bracing weather from May to October.

According to observations taken at St Denis between 1863 and 1870, and reduced to sea-level, the mean monthly temperature varies as follows:—January, 80°·36; February, 80°·36; March, 80°·12; April, 78°·62; May, 75°·30; June, 72°·53; July, 71°·22; August, 70°·59; September, 71°·6; October, 73°·43; November, 76°·62; December, 78°·92; and the rainfall was distributed thus:—January, 8·2 inches; February, 10·9; March, 5·17; April, 4·78; May 2·9; June, 6·1; July, 0·27; August, 1·7; September, 0·80; October, 1·67; November, 3·09; December, 5·25; making an annual average of 45·57 inches, falling in 79·7 days. The prevailing winds are from the south-east, sometimes veering round to the south, and more frequently to the north-east; the west winds are not so steady (three hundred and seven days of east to fifty-eight of west in the course of the year). It is seldom calm during the day, but there is usually a period of complete repose before the land wind begins in the evening. Several years sometimes pass without a cyclone visiting the island; at other times they occur more than once in a single "winter." From April till October there is little fear of them. That of March 1879 was particularly destructive. The *raz de marée* occasionally does great damage. On the leeward side of the island the temperature is higher than at St Denis. The winds are generally from the west and south-west, and bring little rain. Mist hangs almost all day on the tops of the mountains, but usually clears off at night. The mean annual temperature at Salazie is 66° and at the Plaine des Palmistes 61°·7.

The fauna of Réunion is not very rich in variety of species; it Animals. lies midway between the Indian and the African type. The mammals are a brown maki (*Lemur mongoz*, Linn.) from Madagascar, *Pteropus edwardsi* now nearly extinct, several bats, a wild cat, the tang or tamec (*Centetes setosus*, Denn.), several rats, the hare, and the goat. Among the more familiar birds are the "oiseau de la vierge" (*Muscipeta borbonica*), the tec-tec (*Pratincola sybilla*), *Certhia borbonica*, the cardinal (*Foudia madagascariensis*), various swallows, ducks, &c. The visitants from Madagascar, Mauritius, and even India, are very numerous. Lizards and frogs of more than one species are common, but there is only one snake known in the island. Various species of *Gobius*, a native species of mullet, *Nestis cyprinoides*, *Osphronomus olfax*, and *Doules rupestris* are among the freshwater fishes.

In the forest region of the island there is a belt, 4500–5000 feet Vegeta- above the sea, characterized by the prevalence of *Bambusa alpina*; tion. and above that is a similar belt of *Acacia heterophylla*. Besides this last the best timber-trees are *Casuarina laterifolia*, *Fatida mauritiana*, *Imbricaria petiolaris*, *Elæodendron orientale*, *Calophyllum spurium* (red tacamahac), *Terminalia borbonica*, *Parkia speciosa*. The gardens of the coast districts display a marvellous wealth of flowers and shrubs, partly indigenous and largely gathered from all parts of the world. Fruits grown in the island are—the banana, the cocoa-nut, bread-fruit, and jack-fruit, the bilimbi, the carambola, the guava, the litchi, the Japanese medlar, the mango-steen, the tamarind, the *Abelmoschus esculentus*, the chirimoya, the papaya, &c.

Sugar, introduced in 1711 by Pierre Parat, is now the staple crop In- in Réunion, a greater proportion of the soil being devoted to it dustries than to all other objects of cultivation. The methods employed in growing and manufacturing are not up to the Mauritius standard, and since 1878 the ravages of the phylloxera have ruined many of the plantations. In the 18th century the first place belonged to coffee (introduced from Arabia in 1715) and to the clove tree, brought from the Dutch Indies by Poivre at the risk of his life. Both are now cultivated on a very limited scale. Vanilla, introduced in 1818, though it occupies only about 1500 acres, sometimes produces a crop worth from £40,000 to £65,000. The average produce of the sugar crop in the five years 1873–77 was 35,493 tons of sugar with 777,710 gallons of syrup and treacle; from 1878 to 1883 the averages were 35,580 tons (40,176 in 1883) and 816,455 gallons. Rum is largely distilled, and is the favourite drink of all classes.

While potatoes, beans, manioc, sweet potatoes, and yams of Imports. local growth furnish a considerable amount of food, the far more important article rice has to be imported from India and Madagascar. India also sends castor-oil, wheat, and lard; Australia, flour and wheat; England, coals; the Cape and Muscat, salt fish; Buenos Ayres and Montevideo, mules and horses; the United States petroleum (largely used throughout the island), lard, pork, and pitch-pine.

¹ The geology and volcanoes of Réunion were the object of elaborate study by Bory de St Vincent in 1801 and 1802 (*Voyages dans les quatre principales îles des Mers d'Afrique*, Paris, 1804), and have recently been examined by Drasche (see *Bericht K.-K. Geol. Reichsanstalt*, Vienna, 1875-76) and Velain (thesis presented to the Faculté des Sciences, Paris, 1878).

The complete absence of natural harbours has all along been a great hindrance to the commercial development of Réunion. Whenever a storm is observed to be brewing an alarm gun is fired, and the vessels in the roadsteads make off from the dangerous coast. Since 1848 an artificial harbour capable of containing forty vessels has been constructed at Pointe des Galets at the north-west corner of the island. The port is connected by rail with La Possession on the one hand and with the Rivière des Galets on the other, and thus communicates with the railway which was completed in 1881 round the coast from St Pierre, by St Paul, St Denis, &c., to St Benoît, a distance of 83½ miles. This line is carried through a tunnel nearly 6½ miles long between La Possession and St Denis.

The windward arrondissement or division of Réunion comprises the eight communes of St Denis, Ste Marie, Ste Suzanne, St André, St Benoît, Salazie, Ste Rose, and Plaine des Palmistes; and the leeward division the six communes of St Paul, St Leu, St Louis, St Pierre, St Joseph, and St Philippe. St Denis, the capital of the island, lies on the north coast. It is built in the form of an amphitheatre and presents a most attractive appearance from the sea. Covering as a commune an area of 87,065 acres, it has a population of 30,835 according to the census of 1881, an increase of 18,000 since 1837. It has an abundant supply of pure water. Though the harbour is only an open roadstead, it has hitherto been the most frequented in the island. St Pierre, the chief town of the leeward arrondissement, has a communal area of 98,190 acres and a population of 27,748. Its artificial harbour, commenced in 1854 but afterwards interrupted, and resumed in 1881, has room for five or six vessels besides coasting craft.

The population was 185,179 in 1872, 183,529 in 1878, and 170,734 in 1882. The males are largely in excess of the females (97,961 to 72,773 in 1882), owing to the number of agricultural labourers introduced from abroad for a term of years. Among the whites born on the island an infusion of alien blood is so common that in Mauritius the phrase Bourbon white is applied to linen of doubtful cleanness; the original settlers frequently married Malagasy wives. The name Petits Blancs is in Réunion given to a class of small farmers who lead an independent kind of life in the upper districts, supporting themselves by their garden-plots and hunting. By the beginning of the 18th century the number of Negro slaves in the island was 64,000, four times that of their masters; they were all (to the number of 20,000) emancipated in 1848, and have gradually acquired a large measure of social equality with the creoles. Various elements have been added to the population since the middle of the century—coolies from India in large numbers, Africans from the east coast, Chinese and Ananites, Malays, &c. The immigration of the Indian coolies is controlled by a convention between the British and French Governments of date July 1, 1881.

Réunion is usually said to have been first discovered in April 1513 by Mascarenhas, whose name is still applied to the archipelago of which it forms a part; but it seems probable that it must be identified with the island of Santa Apollonia discovered by Diego Fernandes Pereira on February 9, 1507. When in 1638 the island was taken possession of by Captain Gaubert or Gobert of Dieppe, it was still uninhabited; a more formal annexation in the name of Louis XIII. was effected in 1643 by Pronis, agent of the "Compagnie des Indes" in Madagascar; and in 1649 Flacourt, Pronis's more eminent successor, repeated the ceremony at La Possession, and changed the name from Mascarenhas to Bourbon. By decree of the Convention in 1793, Bourbon in turn gave place to Réunion, and, though during the empire this was discarded in favour of Île Bonaparte, and at the Restoration people naturally went back to Bourbon, it has remained the official designation since 1848. Between July 8, 1810, and April 6, 1815, the island was in the possession of England. It is now practically almost a department of France, sends a representative to the chamber of deputies, is governed by means of laws and not of decrees, and possesses a council-general and municipal councils elected by universal suffrage. In the general budget for 1881 the expenditure amounted to 6,866,272 francs, including 1,916,143 contributed by the home Government; in 1883 the total was 7,468,426, upwards of 3,420,000 being for communal expenses.

See, besides the works already mentioned, Demanet, *Nouv. hist. de l'Afrique Française*, 1767; Thomas, *Essai de statistique de l'île Bourbon*, 1828; Dejean de la Batie, *Notice sur l'île Bourbon*, 1847; J. Mauran, *Impressions dans un voy. de Paris à Bourbon*, 1850; Maillard, *Notes sur l'île de la Réunion*, 1862; Azéma, *Hist. de l'île Bourbon*, 1862; Roussin, *Album de l'île de la Réunion*, 1867-69, and 1879; an elaborate article in *Encyclopédie des Sciences Médicales*; Bionne, "La Réunion," in *Exploration*, 1879. Most maps are based on Maillard's; one by Paul Lepervanche in four sheets was published in 1885 by Dufrenoy. (H.A.W.)

REUS, a town of Spain, in the province of Tarragona, is situated at the foot of a chain of hills in a fertile plain about four miles from the sea. It is connected by rail with Tarragona, 9½ miles to the east, and with Lerida, 54½ miles to the north-west. It consists of two parts, the old and the new, separated by the boulevard-like Calle

Arrabal, which occupies the site of the old wall, some vestiges of which still remain: the old town centres in the Plaza del Mercado, from which narrow and tortuous lanes radiate in various directions; the new dates from about the middle of the 18th century, and its streets are wide and straight. The public buildings have no special architectural or historical interest, but the view from the tower of the church of San Pedro is exceptionally fine. Réus, next to Barcelona itself, is the most flourishing manufacturing centre in Catalonia, the staples being silk and cotton; imitations of French wines are also extensively made, and the miscellaneous industries include tanning, distilling, and the like. The cotton factories exceed eighty in number, and one of them employs upwards of six hundred hands. Most of the traffic of Réus passes through the comparatively sheltered port of Salou, four miles distant. The population of Réus in 1877 was 27,595.

The earliest records of Réus date from about the middle of the 13th century. Its modern prosperity is traced to about the year 1750, when a colony of English settled there and established a trade in woollens, leather, wine, and spirits. The principal incidents in its political history arose out of the occurrences of 1843, in connexion with which the "villa" became a "ciudad" and Generals Zurbano and Prim each received the title of count of Réus.

REUSS is the name of two small sovereign principalities of the German empire, with a joint area of 440 square miles, forming part of the complex of Thuringian states, and consisting, roughly speaking, of two principal masses of territory, separated by the Neustadt district of the duchy of Saxe-Weimar. The more southerly and much the larger of the two portions belongs to the bleak mountainous region of the Frankenwald and the Voigtland, while the northern portion is hilly but fertile. The chief rivers are the Elster and Saale. About 37 per cent. of the total surface is occupied by forests, while 40 per cent. is under tillage and 19 per cent. in meadow and pasture. Since 1616 the lands of Reuss have been divided between an elder and a younger line (*Reuss älterer Linie* and *Reuss jüngerer Linie*) of the ancient princely house. The male members of both branches of the family all bear the name of Henry (Heinrich), the individuals being distinguished by numerals. In the older line the enumeration begins again when the number one hundred is reached, while in the younger house it opens and closes with the century. Thus the reigning prince of Reuss jüngerer Linie, born in 1832, is styled Henry XIV., and he succeeded his father Henry LXVII., born in 1789. The princes of Reuss are very wealthy, and their private domains comprise great part of the territory over which they rule. In the event of the extinction of either line, its possessions fall to the other. The troops of Reuss furnish a few companies to the seventh regiment of Thuringian infantry.

REUSS-GREIZ, or REUSS ÄLTERER LINIE, with an area of 122 square miles, belongs to the larger of the two main divisions above mentioned, within which it consists of three large and several smaller parcels of land, bordering on Saxony, Reuss jüngerer Linie, Schwarzburg-Rudolstadt, and the Prussian exclave of Ranis. The soil is on the whole little favourable for agriculture, but cattle-rearing is carried on with some success. No less than 63 per cent. of the inhabitants are supported by industrial pursuits, the chief products of which are the woollen fabrics of Greiz, the capital, and the stockings of Zeulenroda, both largely exported. The population of the principality in 1880 was 50,782, of whom only 450 were Roman Catholics and 60 Jews. The constitution of Reuss-Greiz dates from 1867, and provides for a representative chamber of twelve members, of whom three are appointed by the prince, while two are elected by the nobles, three by the towns, and four by the rural districts,

The revenue and expenditure for 1885 were each estimated at £36,254, while the public debt in 1884 was £46,886.

REUSS-SCHLEIZ, or REUSS JÜNGERER LINIE, with an area of 318 square miles, includes part of the southern and the whole of the northern of the two main divisions above indicated, touching Bavaria on the south and Prussian Saxony on the north. The former portion is known as the Oberland, the latter as the Unterland. Owing to the fertility of the Unterland, agriculture is carried on here with greater success than in Reuss-Greiz, fully one quarter of the population being supported by tillage and cattle-breeding. The industrial activity is, however, also large, supporting one-half of the population. The principal product consists, as in Reuss-Greiz, of woollen goods, and the manufacture centres in the capital, Gera, a busy town with 27,118 inhabitants. A considerable trade is carried on in the products of the manufactories, and in timber, cattle, and slate. The iron mining of the Oberland is limited by the want of sufficient railway communication. Large quantities of salt are yielded by the brine springs of Heinrichshall. In 1880 Reuss-Schleiz contained 101,330 inhabitants, including 442 Roman Catholics and 69 Jews. The annual revenue and expenditure for 1885-1886 were calculated at £66,060; the public debt in 1884 was £61,780.

The history of Reuss stretches back to the times when the German emperors appointed voigts, or bailiffs, to represent them in lands conquered from the Sorbs or other Slavonic races. The forefathers of the present princes of Reuss appear in this capacity at an early period, and the historical head of the family is generally recognized in Henry, voigt of Weida, who flourished about the middle of the 12th century. The name of Reuss came to be applied to the territory ruled over by his descendants from the sobriquet of "Der Russe," or the Russian, which one of them acquired about 1280 from the nationality of his mother. The district embraced by the name was at one time much more extensive than at present, taking in the Bavarian town of Hof and the whole of the Saxon Voigtland. Of the numerous lines and sub-lines into which the family was divided nearly all became sooner or later extinct, till in 1616 none were left except the two that still subsist. Since 1616 numerous subdivisions have again taken place within these families, and it was not till 1848 that Reuss jungerer Linie became again a united whole. The rulers of Reuss were created counts of the German empire in 1671 and sovereign princes in 1778. In 1807 both principalities joined the Confederation of the Rhine, and in 1866 Reuss-Greiz had to atone for its active sympathy with Austria by the payment of a fine. Since 1871 both principalities have been members of the German empire, each sending one member to the federal council and one representative to the Reichstag.

REUTER, FRITZ (1810-1874), the greatest writer in Platt Deutsch, was born on the 7th November 1810, at Stavenhagen, in Mecklenburg-Schwerin, a small country town which had few means of communication with the rest of the world. His father was burgomaster and sheriff (Stadtrichter), and in addition to his official duties carried on the work of a farmer. Until his fourteenth year Reuter was educated at home by private tutors. He was then sent to the gymnasium at Friedland, in Mecklenburg-Strelitz, and afterwards he passed through the higher classes of the gymnasium at Parchim. He had a considerable talent for drawing, and wished to become an artist; but, as his father decided that he should be a lawyer, he began in 1831 to attend lectures on jurisprudence at the university of Rostock. In the following year he went to the university of Jena. The German Governments, alarmed by the revolutionary agitation of 1830, were on the alert to detect symptoms of popular discontent; and a formidable riot at Frankfurt in 1833 gave them an excuse for treating the universities with great harshness. Reuter, as a member of the Burschenschaft "Germania" at Jena, was arrested by the Prussian Government; and, although the only charge which could be proved against him was that he had been seen wearing the German colours, he was condemned to death for high

treason. This monstrous sentence was commuted by King Frederick William III. of Prussia to imprisonment for thirty years in a Prussian fortress. Reuter accepted his fate calmly, and he had need of all his courage, for during the next few years he was taken from one Prussian fortress to another, in each of which he was kept in close confinement. In 1838, through the personal intervention of the grand-duke of Mecklenburg, he was delivered over to the authorities of his native state, but on condition that he should still be a prisoner. The next two years he spent in the fortress of Dömitz. In 1840 to his great joy he was set free, an amnesty having been proclaimed after the accession of Frederick William IV. to the Prussian throne.

Although Reuter was now thirty years of age, he went to Heidelberg to resume his legal studies; but he soon found it necessary to return to Stavenhagen, where he aided in the management of his father's farm. During his imprisonment he had studied many works on agriculture and on the sciences related to it, and he was able to make good use of the knowledge he had thus obtained. After his father's death, however, he was compelled by want of capital to abandon farming, and in 1850 he settled as a private tutor at the little town of Treptow in Pomerania. Here he married Luise Kunze, the daughter of a Mecklenburg pastor. They had been betrothed when Reuter was at Stavenhagen, and their union proved to be one of uninterrupted happiness.

At Treptow he had to work hard as a private tutor for small pay, but in the evenings he found time to amuse himself by writing, in Platt Deutsch, in prose and verse, a number of tales and anecdotes. This collection of miscellanies was published in 1853 in a volume entitled *Läuschen und Riemels*. The book contains many lively sketches of manners in North Germany, and it was received with so much favour that Reuter was encouraged to make new ventures in literature. Fortunately he decided to go on writing in Platt Deutsch. There are so many abstract terms in High German that few writers succeed in the attempt to use it as a vehicle for the powerful utterance of simple and natural feeling. Platt Deutsch, on the contrary, although limited in its range, is fresh and vigorous, and in direct contact with the motives which give unfading charm to old popular songs and ballads. All the resources of this strong and expressive dialect were at Reuter's service. He thought in Platt Deutsch, and in his greatest efforts was always able to find the right word for that exquisite blending of humour and pathos which is one of the most characteristic notes of his writings.

The work which succeeded *Läuschen und Riemels* was *Polterabendgedichte*, and in the same year (1855) appeared *De Reis nach Belligen*, a humorous poem describing the adventures of some Mecklenburg peasants who resolve to go to Belgium (which they never reach) to learn the secrets of an advanced civilization. These writings attracted much attention, and Reuter was so confident of success that in 1856 he left Treptow and established himself at Neubrandenburg, resolving to devote his whole time to literary work. His next book (published in 1858) was *Kein Hüsung*, a poem in which he presents with great force and vividness some of the least attractive aspects of village life in Mecklenburg. This was followed, in 1859, by *Hanne Nütte un de lütte Pudel*, the best of the works written by Reuter in verse. The qualities of those who have a part to play in the story are brought out with remarkable distinctness, and the action provides the poet with many opportunities of giving free expression to his ardent love of nature.

In 1861 Reuter's popularity was largely increased by *Schurr-Murr*, a collection of tales, some of which are in

High German, but this work is of slight importance in comparison with the series of stories which he had already begun, and by which he was to establish his fame as one of the foremost writers of his age. To this series he gave the general title *Olle Kamellen*. The first volume, *Zwei Lustige Geschichten*, published in 1860, contained *Woans ik tau 'ne Fru kamm* and *Ut de Franzosentid*. *Ut mine Festungstid* (1861) formed the second volume; *Ut mine Stromtid* (1864) the third, fourth, and fifth volumes; and *Dörchlüchting* (1866) the sixth volume. *Woans ik tau 'ne Fru kamm* is a bright little tale, in which Reuter tells, in a half serious half bantering tone, how he wooed the lady who became his wife. In *Ut de Franzosentid* he undertook a more difficult task, which enabled him for the first time to do full justice to his genius. The scene is laid in and near Stavenhagen (Platt Deutsch, Stemhagen) in the year 1813, and the principal complications spring from the disappearance of a Frenchman, which gives rise to suspicions of foul play. In this powerful tale the characters are depicted by means of a few bold and rapid strokes, and our interest in them is heightened by the fact that their personal fortunes are associated with the great events which at the beginning of the 19th century stirred the heart of Germany to its depths. *Ut mine Festungstid* is of less general interest than *Ut de Franzosentid*, but it is not less vigorous either in conception or in style. It contains a narrative of Reuter's hardships during the term of his imprisonment, and it awakens sympathy all the more effectually because it is brightened by many a gleam of kindly and humorous feeling. *Ut mine Stromtid* is by far the greatest of Reuter's writings, and ranks with the most famous masterpieces of modern fiction. He records few incidents which might not happen in the lives of ordinary men and women, yet he never loses his hold over the imagination of his readers, so full of vitality are the characters of his story, and so deep is his insight into the enduring facts of human nature. The most original character in the book is Bräsig, an eccentric old bachelor, fond of gossip and apt to interfere too much in the affairs of his neighbours, but humorous, loyal to the core, and coming out most brightly when his good qualities are put to the severest test. There is a touch of romance, too, in this simple and genial nature, for he retains to the last his love for the woman who had fascinated him in his youth, and is always at hand to serve her when she needs his help. Another powerfully conceived character is Havermann, a man of solid and serious judgment, calm and undemonstrative, of sterling rectitude, and revealing at the great crises of life infinite depths of love and pity. Equally attractive in their own way are the good pastor and his wife, who bring up Havermann's daughter, Louise, in their quiet parsonage; and we come to know intimately every member of the pleasant household in which Havermann's frank and comely sister (whom Bräsig secretly loves) is the central figure. In this great book Reuter displays imaginative power of the highest order in the expression of every mood and passion within the proper range of his art; and he fails, or at least does not perfectly succeed, only when he deals with characters belonging to classes he had never had an opportunity of studying closely. As in *Ut de Franzosentid* he describes the deep national impulse in obedience to which Germany rose against Napoleon, so in *Ut mine Stromtid* he presents many aspects of the revolutionary movement of 1848. He shows little sympathy with some of the most characteristic aspirations of the period, but in many passages he indicates by slight but significant touches the strength of the forces which had begun to make for social as distinguished from merely political reorganization.

In 1863 Reuter transferred his residence from Neubrandenburg to Eisenach; and here he died on the 12th June 1874. In the works produced at Eisenach he did not maintain the high level of his earlier writings. *Dörchlüchting*, although it contains some striking passages, lacks the freshness and spontaneity of the other tales of the series to which it belongs; and admirers of his genius found little to interest them in *Die Montechi und Capuleti in Konstantinopel*, which he wrote after a visit to the Turkish capital.

Reuter is the most realistic of the great German writers. To the dreamers of the romantic school he has not the faintest resemblance, nor does he ever attempt to describe ideally perfect characters. The men and women of his stories are the men and women he knew in the villages and farmhouses of Mecklenburg, and the circumstances in which he places them are the circumstances by which they were surrounded in actual life. His fidelity to facts is as exact as that of the Dutch school of painters, and, like them, he thinks nothing too minute for his use, if by small details he can give variety and animation to his pictures. But he does not merely glide over the surface of life; he penetrates to the inmost springs of feeling, and in simple peasant folk finds characteristics which in his hands become types of universal qualities. The sources of tears and the sources of laughter he touches with equal ease; but, while his humour is sometimes rather extravagant, his pathetic passages are always marked by perfect truth and delicacy. His description of the death of the old pastor in *Ut mine Stromtid* is one of the gems of modern literature, and the scene in which Bräsig dies, holding the hand of the woman he has loved all his life, is in a different way not less impressive. Reuter's only serious defect as an artist is that he fails to maintain the due proportion between the different parts of his stories. If an idea attracts him, he cannot resist the temptation to unfold its full significance, whether or not it is in organic relation with his scheme as a whole. To some extent, however, the reader is compensated for these interruptions by happy strokes of humour which would have been rendered impossible had Reuter forced himself to adopt a more rigid method.

Reuter's *Sämmtliche Werke* in thirteen volumes (edited by A. d. Wildbrandt) were published in 1863-68. To these were added in 1875 two volumes of *Nachgelassene Schriften*, with a biography; and in 1878 a comedy, *Die drei Langhänse*. See Glasgow, *Fritz Reuter und Seine Dichtungen*, 1866; Ebert, *Fritz Reuter*, 1874; and Zeil, "Fritz Reuter," in *Unsere Zeit*, 1875. (J. SL.)

REUTLINGEN, a manufacturing town of Württemberg, situated in a fertile and pretty district on the Echatz, an affluent of the Neckar, near the base of the Achalm, and 20 miles to the south of Stuttgart. It is a quaint but well-built town, with numerous picturesque houses and a fine Gothic church of the 13th and 14th centuries, overtopped by a lofty spire. The tanneries of Reutlingen are extensive, producing large quantities of leather; and its other industrial products are very multifarious, including cotton, woollen, and knitted goods, lace, ribbons, hats, shoes, paper, machinery, hardware, and lime. To fruit-growers Reutlingen is interesting as the seat of a celebrated pomological institute, while the Christian-socialist refuges of Pastor Werner are widely known in philanthropic circles. In 1880 the town contained 16,609 inhabitants, of whom 809 were Roman Catholics and 44 Jews.

Reutlingen was made a free imperial town by Frederick II. in 1240, and was unflinching in its loyalty to the emperors of his line. It successfully resisted a siege by Heinrich Raspe, the rival of Conrad IV., and in 1377 its citizens defeated Count Ulrich of Württemberg at the Achalm. At a later period Reutlingen became a member of the Swabian League, and it was among the first Swabian towns to embrace the Reformation. It was annexed to Württemberg in 1802.

REVAL, or REVEL (Russian *Revel*, formerly *Kolywan*; Esthonian *Tallina*), a seaport of Russia, capital of Esthonia, is situated in a bay on the southern coast of the Gulf of Finland, in 59° 27' N. lat. and 24° 45' E. long., 230 miles west of St Petersburg by rail. The city consists of two parts—the "Domberg" or "Dom," which occupies a hill, and the lower town on the beach—and is surrounded by pleasant suburban houses with gardens. The "Dom" contains the castle, where the provincial administration has its seat, and the slopes of the hill are covered with the well-built houses of the German aristocracy. It has

its own administration, separate from that of the lower town. This last retains a mediæval character, with narrow tortuous streets and high tile-roofed houses often enclosing large storehouses within their thick walls. Reval has more interesting antiquities than any other town of the Russian Baltic provinces. The old church of St Nicholas, built in 1317, contains many antiquities of the old Catholic times and old German paintings, of which a Dance of Death is especially worthy of notice. It contains also the graves of Holstein Beck and of the Duc de Croy, who was denied burial for his debts, and whose mummy, dressed in velvet and fine lace, was exposed until 1862. The "Domkirche" contains many interesting shields, as also the graves of the circumnavigator Krusenstern, of Pontus-de-la-Gardie, Henry Matthias, Karl Horn, &c. The church of St Olai, first erected in 1240, and often rebuilt, was completed in 1840 in Gothic style; it has a bell tower 429 feet high. The oldest church is the Esthonian, built in 1219. Water is brought from Lake Järvakylä by an aqueduct. The pleasant situation of the town, surrounded by beautiful parks, attracts in summer thousands of people for sea-bathing.

The population of Reval has increased rapidly since it has been connected by rail with St Petersburg and with Baltic Port, 30 miles distant; it reached 50,490 in 1881, against 27,325 in 1867, of whom one-third are Germans, the remainder Esthonians, with a few Russians and Jews. Nearly 15,000 inhabitants belong to the Greek Church. The manufactures are not important, but trade grows steadily. In 1882 the exports (grain, spirits, &c.) were £1,746,244, the imports (coal, iron, chemicals, &c.) £6,858,247. In 1882 Reval was visited by 589 foreign ships (291,450 tons), mostly English, German, and Scandinavian, and by 802 coasters (103,000 tons). It has regular steam communication with St Petersburg, Helsingfors, Königsberg, &c.

The high Silurian crag now known as Domberg was early occupied by an Esthonian fort, Lindanissa. In 1219 or 1233 the Danish king Waldemar II. erected there a strong castle and founded the first church of the Holy Ghost. In 1228 the castle was taken by the Livonian knights, but nine years later it returned to the Danes. About the same time Lübeck and Bremen merchants settled there under the protection of the castle, and their settlement soon became an important seaport of the Hanseatic League. It was fortified early in the 14th century, and in 1343 sustained the siege of the revolted Esthonians. Waldemar III. sold Reval and Esthonia to the Livonian knighthood for 19,000 silver marks, and the town belonged to the knighthood till its dissolution in 1561, when Esthonia and Reval surrendered to the Swedish king Erik XVI. A great conflagration in 1433, the pestilence of 1532, the bombardment by the Danes in 1569, and still more the Russo-Livonian War, broke down its formerly wealthy trade. The Russians not only devastated the neighbouring country but also besieged Reval twice, in 1570 and 1577. It was still, however, an important fortress, the forts and walls having been enlarged and fortified by the Swedes. In 1710 the commander Patkull surrendered it to Peter I., who immediately began there the erection of a military port for his Baltic fleet. The successors of Peter I. continued to fortify the access to Reval from the sea, large works being undertaken especially in the first part of the present century. During the Crimean War the suburb Reperbahn, situated on a low slip of coast, was destroyed in view of a possible landing of the allies.

REVELATION, Book of. The book of the New Testament called "Revelation of John" (*Ἀποκάλυψις Ἰωάννου*) so long passed for the most obscure and difficult document of early Christianity that scholars hesitated to apply to it the historico-critical method of investigation. Since this hesitation has been overcome, it appears that the matter of the book is neither obscure nor mysterious, although many special points still remain to be cleared up. Without being paradoxical we may affirm that the Apocalypse is the most intelligible book in the New Testament, because its author had not the individuality and originality of Paul or of the author of the Fourth Gospel, and because

historically we can trace and comprehend its author's position much better than we can, for instance, the theology of Paul. But all interpretations not strictly historical must be excluded. The ethico-spiritualistic, rationalistic, and dogmatic explanations, such as were first attempted by the Alexandrine theologians, are fatal to the understanding of the book, as are also the explanations drawn from church history which were first put forward by mediæval sects. To see with Hengstenberg "demagogy" in "Gog and Magog" (xx. 8), to identify "Apollyon" (ix. 11) with "Napoleon," or in antichrist to detect the emperor or the pope or Mohammed or Luther or Calvin—these interpretations are not a bit worse than those which turn the book into a compendium of morality or dogma wherein is set forth by means of imagery and allegories the triumph of virtue over vice or of orthodoxy over heterodoxy. The justification of the interpretation which explains the book entirely in the light of the historical circumstances attending its origin and of the views current amongst primitive Christians follows, above all, from observing that as a literary production the Revelation of John is by no means unique, but belongs to a class of literature (comp. *APOCALYPTIC LITERATURE*, vol. ii. p. 174) which then had a very wide currency amongst the Jews, and the numerous remains of which even the most orthodox theologians do not hesitate to interpret by the help of the history of the time. The apocalyptic literature, in the strict sense of the word, began with the Jews in the 2d century B.C.; in fact it developed as an aftergrowth of the prophetic literature, from which it differs less in kind than in degree. For more than three centuries it had sought to revive the drooping spirit of the people by revelations of a near future when, after one last dreadful onset of a hostile world, Jahveh would appear in the person of His Messiah to conquer the nations of the world and to set up the kingdom of glory for Israel. Every time the political situation culminated in a crisis for the people of God the apocalypses appeared stirring up the believers. In spirit, form, plan, and execution they closely resembled each other. Their differences sprang only from the difference of the times, for every apocalyptic writer painted the final catastrophe after the model of the catastrophes of his day, only on a vaster scale and with deepened shadows. They all spoke in riddles; that is, by means of images, symbols, mystic numbers, forms of animals, &c., they half concealed what they meant to reveal. The reasons for this procedure are not far to seek:—(1) clearness and distinctness would have been too profane—only the mysterious appears divine; (2) it was often dangerous to be too distinct. The apocalyptic writers in their works supplied revelations on all possible questions, but their principal achievement was regularly a revelation of the history of mankind in general and of the people of Israel in particular; in their most essential features the apocalypses are political manifestos. It is characteristic of all apocalypses that they pass under false names, being attributed to the most celebrated persons of the Old Testament; thus we still possess apocalypses under the names of Daniel, Baruch, Ezra, Moses, and Enoch. These old heroes are represented in the respective works as speaking in the first person, and exhorting their readers to await with hope and patience the coming of the Messiah. Usually the apocalypse contains a brief summary of history, beginning with the time of the nominal and ending with that of the actual author, in order that the reader, perceiving how much of the prophecy has already been fulfilled to the letter, may look with assured confidence for the fulfilment of the rest. Lastly, the particular features in the descriptions as well as the images and metaphors are usually borrowed in great measure from the books of the old prophets, but they are painted in

heightened colours on an ampler canvas. "The imagery is alive with the burning breath of the East; a luxuriant fancy sacrifices beauty to boldness and sets proportion at defiance; all that is sweet and human yields to all that is monstrous and repulsive. A flow of metaphors, an interminable personification of abstractions, animates these strange creations with the weird and awful life of some fantastic resurrection scene. At the same time none of the descriptions are clear and intelligible; the outlines of the pictures melt and fade away in tremulous lines despite the coarseness of the material on which they are drawn."

As Jesus Christ had promised to come again, the Jewish expectations of a Messiah who should be revealed continued unabated among many of His disciples; that which as Jews they had hoped from the first and only advent they now deferred till the second. True, the kingdom of God which He had promised did not tally with the materialistic hopes of the people, but on the other hand He had not infrequently Himself employed the figurative language of the prophets and apocalyptic writers; and, after He had left the earth, many sayings borrowed from the Jewish apocalypses were put in His mouth by a vitiated tradition.¹ In the expectations of Christians of the 1st century spiritual and material elements were strangely blent. Hence not only were the Jewish apocalypses, the genuineness of which no one doubted, read in the Christian communities and transmitted to the Gentile converts, but soon there appeared new apocalypses written by Christians. We cannot wonder at this, for all conditions favourable to the production of such writings were to be found in the churches also; above all, men were conscious of possessing the spirit of prophecy in a far fuller measure than ever before, and this spirit necessarily manifested itself not only in signs and wonders but also in revelations and predictions. Of the Christian apocalypses written between 70 and 170 A.D. only a very small portion is known to us; for the later church viewed them as dangerous and got rid of them. Even of the apocalypse of Peter, written in the 1st century and regarded as canonical in some provinces as late as the 3d, only a very few fragments have come down to us.² But the great Apocalypse which bears the name of John has been preserved. It is to its reception into the canon that we owe the preservation of this precious, indeed unique, monument of the earliest Christian times.

Form, Contents, and Purpose.—If we leave out of view chapters i. to iii. the Apocalypse of John does not differ very materially in form from the Jewish apocalypses; but undoubtedly its arrangement is better, and its execution simpler and grander, and therefore more tasteful.³ In its contents, however, the distinction between this Christian apocalypse and its Jewish fellows is marked; for, while the latter have not and could not have any actual knowledge of the Messiah whom they promise, the Apocalypse of John centres round the crucified and risen Jesus, the Lamb that was slain. The author knows whom he and the Christian community have to expect; to him Jesus Christ is the alpha and the omega, the first and the last; he is the Lord of the world and of history. And this faith

gives to the Apocalypse of John a tone of assured confidence and hope such as is not to be found in the Jewish apocalypses. On the other hand, however firm and sure the Christian faith of the author appears, he was still completely hide-bound in the old forms; it is really a case of new wine in old bottles. But this very circumstance gives to the book its peculiar charm, for in no other early Christian writing are new and old to be found so completely mingled as in this. The author's attitude towards the world and the state is still entirely the Jewish attitude of surly hate—this disciple of the gospel has not yet learned that we are bound to love our enemies; but his attitude towards God and his view of the value of a man's own works show no longer the Jewish but the new Christian belief, for he sees God in Christ, he has accepted the doctrine of the forgiveness of sins through the blood of the Lamb, and regards himself as a priest and king before God. Hence too he lives and moves no longer in the law but in the prophets and the psalms. From them, especially from the prophets Ezekiel, Zechariah, and Daniel, he borrowed most of his imagery and symbols. What he has done in his book is to create a great apocalyptic painting or rather a drama worked out in different acts. Impatient longing for the end, a deep abhorrence of the heathen state, a firm faith in Christ and His second coming, a minute and painstaking study of the old prophecies—these are the sources from which the description of the future are drawn. The purpose is the same as that of all apocalypses—to confirm and strengthen the little family of believers in their patience, their courage, and their confidence, by pointing out that the sufferings of the time will last but a brief span and that the present troubles are already the beginning of that end when sorrow and suffering will in a moment be transformed into glory unspeakable.⁴

The revelation proper begins with iv. 1,—the first three chapters forming an introduction (the seven letters to the seven churches of Asia Minor, which are prefixed, are marked by poetical beauty and power of language). The future is written in a book with seven seals, which the Lamb opens one after the other (iv., v.). The opening of each seal brings a plague upon the earth (vi.). Before the seventh seal is opened, the church of the latter days is itself sealed that it may be preserved harmless from the assaults of the powers of hell (vii.). At the opening of the seventh seal seven angels with trumpets appear on the scene, each of whom blows a trumpet-blast as a prelude to new horrors on the earth (viii., ix.). With the sixth trumpet the preliminary judgments are at an end (hence the episode, ch. x.). The judgment proper begins with the fall of Jerusalem (xi.). Then the seventh trumpet sounds as the signal for the last dread horrors and for the final judgment of the world and of all wickedness. This is preceded, however, by a description of the preservation of the church of the latter days (xii.), forming one of those pauses in the narrative which give the reader breathing time and relieve the horror of the description by the introduction of scenes of peace and words of comfort. The power of the world that opposes Christ (the Roman empire) is described along with all its devilish accomplices (xiii.), and (xiv.) its destruction is by anticipation set forth in figures. The seven angels follow with the seven vials of wrath, which are poured forth and represent the beginning of the final catastrophe (xv., xvi.). This final catastrophe, involving the imperial city, the antichristian emperor, his governors, and, last of all, the devil himself, is described in xvii.—xx. 3,—xix. 11 *sq.* forming the climax, when Christ himself appears on a white horse and vanquishes all his foes. The devil is chained in the bottomless pit for a thousand years; during this time the saints of the latter days—not all believers—reign with Christ.⁵ After the devil

¹ E.g., the saying of Jesus handed down by Papias in Iren. v. 33; compare with it *Apoc. Baruch*, 29. In the eschatological speeches of Jesus reported by the synoptical writers there is no doubt that sayings are introduced which are derived not from Jesus but from the Jewish apocalyptic writers. See the discussions in Weiffenbach, *Der Wiederkunftsgedanke Jesu*, 1873.

² See Hilgenfeld, *Nov. Test. extra Can. recept.*, fasc. iv.

³ The literary value of the Apocalypse of John is much higher than that of any of the Jewish apocalypses. The author possessed the art of keeping his readers enthralled and excited from first to last; by a suitable arrangement he has really reduced his motley material to order, and by skilful description he has contrived to make even the repulsive endurable.

⁴ The way in which the author has given expression to this practical purpose by means of scenes and images reveals the great artist.

⁵ This idea, germs of which are to be found in the Jewish apocalypses, is easily explained when we remember that two different views of the resurrection and of the future kingdom prevailed amongst the Jews. According to the one view only favoured persons, according to the other every one would rise from the dead; according to the one view the future kingdom would have only a limited duration, according to the other it would be eternal. In the Revelation of John the two suppositions are combined.

has been released once more and has made war on the holy city he is for ever overthrown and the last judgment follows (xx.). In xxi.-xxii. 5 the glory of the heavenly and eternal Jerusalem is set forth. In xxii. 6-21 several epilogues may be detected.

Unity and Integrity.—The above analysis will have shown the essential unity of the book. The more attentively we scan the connexion of the descriptions with each other the more clearly do we perceive the unity, the artistic and systematic arrangement, of the book. This is completely overlooked by those who fancy that in the seven seals, the seven trumpets, the seven vials of wrath, the whole course of the judgment is simply repeated in ever new imagery. Leaving all other objections out of account, this supposition is refuted by the simple observation that the author has not merely placed the different scenes side by side but has linked them together in such a way that each scene follows as a consequence from the scene before. A correct perception of the plan of the book further negatives the opinion of older scholars and of Völder in modern times (*Die Entstehung der Apokalypse*, 1882) that the book consists of different parts by different authors.¹ But it is probable enough that the work has been interpolated and touched up in various places (certainly in i. 1-3); and several verses of the epilogue (xxii. 6-21) are not by the author of the book, as indeed the language itself is sufficient to prove. Unless we are utterly deceived, the book underwent systematic if not very radical revisions even before the middle of the 2d century.² To the additions then made belong, amongst others, the famous words (xix. 13) *καὶ κέκληται τὸ ὄνομα αὐτοῦ ὁ λόγος τοῦ θεοῦ*, which do not fit into the passage. An exact investigation of the extent of the alterations and additions would be a very useful work.³

Language.—The language is more Hebraic than that of any other New Testament book. The author thought in Hebrew and wrote in Greek. But the gross violations of Greek grammar are not to be explained from ignorance. "In the language of the Apocalypse there is nothing of the bungling and happy-go-lucky style of a beginner; indeed it bears the stamp of consistency and purpose." The author writes, e.g., *χάρις καὶ εἰρήνη ἀπὸ ὁ ὦν καὶ ὁ ἦν καὶ ὁ ἐρχόμενος καὶ ἀπὸ τῶν ἑπτὰ πνευμάτων . . . καὶ ἀπὸ Ἰησοῦ Χριστοῦ, ὁ μάρτυς, ὁ πιστός* (i. 4, 5), although he has shown in a hundred passages that he knew very well the rules which he has here broken. He must have deliberately intended to break them in order to give to the words of his greeting a certain elevation and solemnity. Of course only to a foreigner could it have occurred to employ those means for this end.

Author's Standpoint.—That the book is not written by a disciple of the apostle Paul, that its author is filled with Jewish hatred and abhorrence of the heathen state, that in other ways traces of the Jewish spirit crop up here and there in the Apocalypse, is beyond question. But many critics, especially the so-called Tübingen school, as well as Renan, Mommsen, and others, have gone still farther; the author of the Apocalypse, say they, was an Ebionite and a decided opponent of the apostle Paul. In support of this hypothesis, which they put forward as if it were an

established truth, they appeal chiefly to the following observations:—(1) in ch. vii. only 144,000 Jews are sealed, therefore the author regarded only born Jews as full members of the Messiah's kingdom; consequently (ver. 9 sq.) the multitude which is not numbered forms a wider circle, viz., the proselytes, who are not counted and also not sealed, and are therefore of lower rank; (2) in ii.-iii. the author displays the greatest abhorrence of those who eat meat which has been offered to idols and who practise "fornication"; by these none but disciples of Paul can be meant; (3) in xxi. 14 the author speaks only of twelve apostles, and thereby undoubtedly excludes Paul; (4) the author praises (ii. 2) the Ephesians because they have found the false apostles to be liars and have rejected them, but by these false apostles only Paul could be meant; (5) the author cannot conceive (xi. 1, 2) that the temple at Jerusalem should ever be destroyed, and proves by this how much he himself still clung to the temple worship.

The point in dispute is of the highest importance for the proper understanding of the history of primitive Christianity. If the Tübingen school is right, the Pauline epoch was followed in Asia Minor by an Ebionitic epoch, and in this case catholicism may very well be the product of a compromise between Paulinism and Jewish Christianity. But on this very point it can be clearly shown that the Tübingen school is in the wrong; for the above arguments amount to nothing.

(1) The 12 × 12,000 (vii. 4 sq.) can only, like James i. 1, be interpreted allegorically and referred to Christians generally without respect of nationality; the twelve tribes are the Christians. This interpretation is the only possible one, because (a) in xiv. 8 it is said of the 144,000 that they are bought from the earth, and because (b) besides the 144,000 who are sealed no one survives the horrors of the last time. We must not overlook the fact that in ch. vii. two entirely different visions are presented, which are not to be fused into a single vision: the 144,000 are on earth, the unnumbered multitude (ver. 9 sq.) are not a supplement of these 144,000, but are already in heaven and represent the sum of all the children of God from the beginning. Thus, if the 144,000 were exclusively Jews, in the last time there would be no Christian at all from among the heathen; that is, no heathen would be saved. But that this is the author's meaning not even the Tübingen critics can maintain. Thus the "twelve tribes" are to be understood allegorically. As Abraham is the father of all believers, so all believers make up the nation of the twelve tribes. (2) The polemic against the eating of meat offered to idols and against "fornication" is not peculiar to the author, but is to be found in several early Christian writings. It is not a polemic against Paul; at most it is a polemic against lax disciples of Paul; further it is no sign of Ebionitism, for very many Gentile Christian writers of the 2d century (e.g., Justin) combated the eating of meat offered to idols. The rule mentioned in Acts xv. 29 may really have been made between 58 and 70 A.D., and may have been a condition of intercourse between Jewish and Gentile Christians. After that time it gradually prevailed all over Christendom. (3) In the ideal description of the new Jerusalem it would have been impossible for the author to speak of thirteen apostles. (4) The plural *ἀπόστολοι* (ii. 2) shows that Paul is not meant, and the comparison with ii. 9 and iii. 9 makes it probable that Jewish emissaries are intended. But, apart from this, we see better than heretofore by the newly discovered *Teaching of the Apostles* that the name "apostle" was not confined to the twelve apostles and Paul. If the author had wished to express abhorrence of Paul he could not have done it more obscurely than he has done it in ii. 2. (5) The author says expressly (xxi. 22) that he saw no temple in the new Jerusalem, "for the Lord is her temple and the Lamb"; hence he felt that the temple worship was no longer needed to satisfy his religious wants; in excepting the temple buildings from the universal destruction (xi. 1) he follows a Jewish notion, to which in his heart he has already risen superior.

The arguments to prove the Ebionitism of the Apocalypse are therefore insufficient; rather, we should say, the Apocalypse shows us a Christianity free from the law, free from national prejudices, universal, and yet a Christianity which is quite independent of Paul. It is this that constitutes the high importance of the book. The author speaks not at all of the law—the word does not occur in his work; he looks for salvation from the power and grace of God and

¹ See *Theol. Lit.-Zeitung*, 1882, No. 24.

² The redaction of the Apocalypse took place long before Irenæus (before 185 A.D.), for it can be shown that the *σπουδαία καὶ ἀρχαία ἀνάγραφά* to which he appeals already exhibited the Apocalypse in the form in which we now read it (Iren., v. 30).

³ The state of the text is much more uncertain than in most of the New Testament books, because there are far fewer uncial MSS. of our book than of the Gospels and Epistles; in fact there are only five, of which only three are complete. The best MSS. are the Sinaitic, the Alexandrine, and the Ephraemi Parisiensis (incomplete). The so-called *textus receptus* of the Apocalypse is especially bad, owing to causes which Delitzsch was the first to point out (*Handschriftliche Funde*, 1861-62).

Christ alone, and knows that to be clean a man must wash his robes in the blood of the Lamb; nowhere has he made a distinction between Gentile and Jewish Christians; in this respect he is even more liberal than Paul, for Paul believes in a continued preference accorded to the people of Israel, while our author knows of no such thing; in his view preference is given only to the martyrs and confessors of the latter days; they alone shall reign with Christ a thousand years;¹ the people of Israel, so far as it has rejected Christ, is to our author simply a "synagogue of Satan" (ii. 9; iii. 9). In this respect it clearly appears that the author of the Apocalypse has cast aside all national religious prejudices.² Accordingly to him Jesus is not the Messiah of the Jews—of this there is no mention in the book—but the Saviour of the world, the Lord of heaven and of earth, the disposer and director of history. The Christology of the Apocalypse is nowhere Ebionitic; rather it stands midway between that of Paul and that of the Fourth Gospel, and is more elevated than the former: Christ is made almost equal with God and has the same predicates and names as God.³

The Apocalypse teaches us that even in the apostolic age the conceptions of Paulinism and Ebionitism do not explain everything; it is neither Pauline nor Ebionitic. It shows us that at the close of the apostolic age there was a Christianity which was free from the law and universal, and yet continued to adhere to Jewish modes of expression; it shows us that it was possible to think and feel like a Jew in politics, and yet in religious thoughts and feelings to be evangelical and superior to all earthly limitations. These, however, are glaring contradictions which could not last. But the fact that in the Apocalypse we possess a document exhibiting these contradictions imparts to the book its high importance. From Paul's epistles we can only learn how a great mind has worked its way from the letter of the law up to freedom; from the Apocalypse we can learn how from the Jewish fusion of religion, nationality, and politics thousands were gradually led upwards to the gospel, and we can further learn that the step from the premises to the conclusion is one of the hardest to take. The author of the Apocalypse has in many points not yet drawn the conclusions.

Date and Historical Position.—All impartial scholars are now agreed that in chapters xiii. and xviii. of the Apocalypse we must look for the key to the comprehension of the book as well as to the question of the date of its composition. That the beast (xiii. 1 sq.; xvii. 3 sq.) is the Roman empire, that the seven heads are seven emperors, that the woman (xvii. 3–9) is the city of Rome, that the ten horns (xiii. 1; xvii. 3, 12 sq.) are imperial governors—all this is now beyond dispute.⁴ Also it is settled that a Roman emperor will be the antichrist, and that the author abhorred nothing so much as the worship of the emperor. Hence it is very probable, and has been maintained by Mommsen especially on good grounds, that the second beast (xiii. 11) is meant to describe the imperial representatives in the provinces, especially the Roman governors in the Asiatic continent. Finally, almost every one regards the year 64 as the *terminus a quo* of the composition of the book, inasmuch as the bloody persecution of the Christians in Rome (xiii.

7; xvii. 6; xviii. 20–24) is presupposed in the narrative.⁵

But, while scholars are at one on these points, they still differ on the question of the person of antichrist. The one side affirm that the author regarded Nero returned from the grave as antichrist (so Ewald, Lücke, De Wette, Credner, Reuss, Volckmar, Mommsen, Renan, &c.); the other side deny this (so Weiss, Dürstiedt, Bruston, &c.), and try to identify antichrist either with Domitian or with an emperor not defined. But the grounds on which they combat the former hypothesis are of little moment. That the antichrist of the Apocalypse is Nero returned to life results from the following considerations:—

(1) In ch. xiii. 3 it is said that one of the heads of the beast received a deadly wound but was afterwards healed to the astonishment of the world. Now if it is settled that the beast is the Roman empire, and that by the heads are designated the emperors, the statement is only applicable to Nero, in whose death it is well known that the people did not believe, many persons expecting that he would return from the East.⁶ (2) In xvii. 8, 11 one head is identified with the whole animal, and of the animal it is said that "it was and is not and will come again," meaning that the eighth head is not a new one but one of the seven. From this it necessarily follows that in the author's view the antichrist will be an emperor who has reigned once already and who represents the whole wickedness of the empire (the beast) concentrated and embodied in himself; but this can only be Nero, for of no other emperor was the report current in the empire that he would come again, and no emperor but Nero had instituted a persecution of the Christians. (3) In xiii. 18 it is said that the number of the beast—that is, according to the Hebrew art of Gematria, the sum of the numerical values of the letters of his name—is the number of a man, and is 666. Down to 1835 this saying was a riddle which no man could read, though Irenæus (v. 30) had attempted an explanation: he thought of Teitan, Evanthes, Lateinos. But in 1835 Fritzsche, Benary, Reuss, and Hitzig discovered simultaneously that the numerical values of the words קסר נרון ("Emperor Neron") = 100 + 60 + 200 + 50 + 200 + 6 + 50 = 666. The old variant 616 must be regarded as a confirmation of this explanation, for 616 is = קסר נר' ("Emperor Nero"). It may certainly appear strange that the calculation is made according to the numerical value of the Hebrew letters, while the book is written in Greek; but, as there is no doubt that the author has thought as a Semite from first to last, it is not surprising that he has set forth his great secret in Hebrew letters (comp. Ἀπαγγελῶν, xvi. 16). (4) Down to the 5th century it was believed by Western Christians that Nero would come again and be the antichrist or his precursor.⁷ In the East also this belief can be shown (see the Sibylline oracles) to have still existed in the 2d century.

For these four reasons it is certain that the author of the Apocalypse believed that Nero would come again, and regarded him as the antichrist. He wrote under the impression of the story current in the East that Nero had gone to the Parthians and would return with them to reclaim his empire.

Hence the Apocalypse was written after the summer of 68 A.D.,⁸ but the question still remains whether it was written under Galba or Vespasian or Domitian. Most of the scholars who accept the right explanation of the antichrist suppose it to have been written under Galba; the beginning of Vespasian's reign is preferred by Lücke (whose earlier opinion was different), Bleek, Böhmer, and also Dürstiedt and Weiss; Mommsen upholds the later years of Vespasian; but the old tradition of the church

⁵ The statement of Epiphanius (*Hær.*, li. 12) that the Apocalypse was written under Claudius is untenable.

⁶ Bruston refers the wounded head to Cæsar; but what could have induced the author to mention and put in the foreground an event which had taken place about one hundred years before?

⁷ See the *Carm. Apolog.* of Commodian; the commentary of Victorinus on the Apocalypse; Lactantius, *De Mort. Persec.*, 2; Martin of Tours in Sulp. Severus, *Dial.*, ii. 14; Sulp. Sev., *Chron.*, ii. 28, 29, &c.

⁸ Against Bruston, who supposes that it was written between 64 and 68 A.D., by reckoning the emperors (xvii. 10) from Cæsar, and hence taking the reigning emperor to be Nero. But Bruston is thus compelled to reject the explanation that the returned Nero is the antichrist, and he cannot account for the mention in the Apocalypse of numerous martyrs at Rome.

¹ Observe that in his brief description of the millenium (ch. xx.) the author neither speaks of the Jewish people nor introduces any grossly material conception. This is the strongest proof that he was not an Ebionite.

² Compare also xi. 8, where Jerusalem is called "Sodom and Egypt."

³ The Christological conceptions and formulas which occur in the book are not always consistent. This is not, however, in itself a proof of interpolation.

⁴ Dürstiedt alone regards the ten horns as emperors.

represents the work as written under Domitian and even towards the close of his reign. This tradition rests on very ancient testimony, that of Irenæus,¹ but has met with no approval from critics of the present century; only the traditionalists who reject the historical interpretation accept it. It is the only case in the whole range of the New Testament where criticism assigns to a writing a higher antiquity than is allowed it by tradition. Whether criticism has not been too hasty in setting aside the statement of Irenæus will appear in the sequel.

In support of the supposition that the Apocalypse was written before August 70 A.D., the chief argument adduced is that ch. xi. assumes that Jerusalem and the temple are still uninjured. Mommsen (*Röm. Gesch.*, v. 521) has not succeeded in satisfactorily disposing of this argument. The Apocalypse is cognizant of the flight of the Jewish Christians into the country beyond Jordan towards Pella (ch. xii.); it expects the partial destruction of Jerusalem in the immediate future.² But this very expectation as well as the confidence that the temple would remain uninjured shows that at that time city and temple were still standing. Hence, as ch. xi. was written before August 70, most critics, assuming that the whole book dates from one and the same time, conclude that it was composed under Galba,—that is, between autumn 68 and spring 69. In their view the five emperors who have fallen are Augustus, Tiberius, Claudius, Caligula, and Nero, therefore the reigning emperor is Galba,³ and the reason why the author does not make antichrist (the returning Nero) immediately succeed Galba is a wish to carry on the number seven, and because “even a prophet owes some consideration to the powers that be”; but he allows this unknown successor only a short reign, and then comes the returned Nero and the end of the world.⁴ Lastly, these critics point to the fact that a false Nero appeared immediately after the death of the real Nero (Tacitus, *Hist.*, ii. 8, 9). This position is very strong, but there are two objections to it,—in the first place, it is uncertain whether Galba should be included in the list of emperors at all—so eminent an authority as Mommsen is against including him, and reckons Vespasian as the sixth, and, secondly, the author of the Apocalypse thinks of a false Nero who will ally himself with the Parthians (see ch. ix. and elsewhere). Therefore his false Nero appears not to be that of Tacitus, but the one who in the last years of Vespasian found a following in the Euphrates district and was acknowledged in the reign of Titus by King Artabanus, who prepared to restore him at Rome by force of arms, but was at last surrendered by the Parthians, about 88, to Domitian (so Mommsen; compare *PERSIA*, vol. xviii. p. 603). On this view the Apocalypse was written about 75–79. Thus we see that we have here two discrepant calculations (autumn 68 to spring 69; about 75–79); each has much in favour of it, but also at least one strong argument against it:—against the first calculation there is the argument that the false Nero who best suits the case did not appear till about 75, while against the second calculation there is the argument that according to ch. xi. the destruction of Jerusalem had not yet taken place.⁵ In these

circumstances it appears perhaps best to assume that the Apocalypse was written under Galba, that is, that the conception and the first draught of it date from this time, but that the seventeenth chapter was afterwards revised in the last years of the reign of Vespasian, about 75–79. Now it is to be remembered that Irenæus asserts most explicitly that it was revealed in the last years of Domitian. Such a statement is not to be simply set aside, especially when it seems to make a writing later, and not earlier, and when there is internal evidence that the book underwent revisions. Further exact investigation of the details of the Apocalypse will perhaps supply positive proofs; at present the following can be put forward merely as an hypothesis, for which only a certain probability is claimed:—the Apocalypse was written under Galba, but afterwards underwent revisions under Vespasian, about 75–79, and perhaps in Domitian’s reign of terror, about 93–96 (compare what has been said above on the unity and integrity).

Place of Composition—Authorship.—That the Apocalypse was written at some place on the west coast of Asia Minor has never, so far as known to the present writer, been doubted by any critic of note.

The tradition of the church ascribes the Apocalypse to the apostle John,⁶ and the Tübingen school has felt bound in this case to agree with tradition. Within the last twenty years or so the question has been much complicated by being mixed up with the question of the origin of the Fourth Gospel; all, however, agree that the book was written by a born Jew. At present the following views are maintained:—(1) the Gospel and the Apocalypse of John are by the apostle John (Ebrard, Hengstenberg and his school, Hofmann and his school, Kliefoth); (2) the Gospel is by an unknown author, the Apocalypse is by the apostle John (Baur, Schwegler, Köstlin, Hilgenfeld); (3) the Gospel is by the apostle John, the Apocalypse is by a man called John, the otherwise known presbyter, who had no wish to be taken for the apostle (Lücke, Bleek, Ewald, Credner, De Wette, Neander, Reuss, Düsterdieck, Keim, Holtzmann, &c.);⁷ (4) the Apocalypse is by another John, one of the apostle’s disciples, who afterwards received the tacit approval of the apostle, so that the Revelation passed in the church as a work of the apostle (Renan); (5) the Apocalypse was foisted on the apostle John without his knowledge (Volckmar, &c.). Of these views the first and fourth may be summarily dismissed, the latter because Renan has not brought forward even the shadow of a proof, the former because the differences between the Apocalypse and the Gospel in language and opinions are too great to allow us to suppose that the books are by the same author.⁸ It is true that on the other hand both writings have much in common, nay, even that there is a profound affinity between them, but this only proves that their authors lived in the same country, and were to some extent subject to the same intellectual influences. Even Hase, who formerly thought it possible to refer Gospel and Apocalypse to the apostle John (see his work, *Die Tübinger Schule*, 1855), has renounced this view. But what is to prevent us from ascribing at least the Apocalypse to the apostle

¹ Iren. v. 30, 3: ἡ ἀποκάλυψις οὐ πρὸ πολλοῦ χρόνου ἐωράθη, ἀλλὰ σχέδον ἐπὶ τῆς ἡμετέρας γενεᾶς, πρὸς τῷ τέλει τῆς Δουμιτιανοῦ ἀρχῆς.

² The three and a half years in xi. 2, xii. 14, xiii. 5 are taken from the Apocalypse of Daniel, and no deeper meaning is to be sought in them.

³ Hildebrand regards the sixth as Vitellius (*Ztsch. f. wiss. Theol.*, 1874, p. 76 sq.).

⁴ So Reuss, Volckmar, Credner, De Wette, also Renan (*Antechrist*), but the last-mentioned, though he put the Apocalypse in the reign of Galba, begins the enumeration of the heads with Julius Cæsar, and hence gets into difficulties.

⁵ The view that the Apocalypse was written between the spring of

69 and August 70, hence in the beginning of Vespasian’s reign, has least to recommend it. Some of the critics who have maintained it are much biased. Thus Düsterdieck regards the sixth emperor (xvii. 10) as Vespasian, the seventh, who is to remain for only a short time, as Titus, and the eighth as Nero. But, as the book was written, according to Düsterdieck, shortly before 70, it follows that “we have here a prophecy which definitely announces certain historical events beforehand.” Thus the claim of the Apocalypse to be an actual prophecy is justified, though only in one verse.

⁶ So Justin; see *Dial. c. Tryph.*, 81.

⁷ Some of these scholars also deny that the Gospel is by John.

⁸ This was observed by Dionysius of Alexandria (in Euseb., *H. E.*, vii. 27).

John? Certainly the external testimony is very good,¹ the doubts entertained by the Alexandrians, by Eusebius, and by Byzantine theologians as to the apostolic authorship of the book have not much weight, the book being little to their mind, and the substance of the Revelation would in many respects suit John Boanerges. But the following considerations speak against the apostle John as author:—(1) the so-called "Alogi" (Epiph., *Hær.*, li.) denied that the work was by the apostle, and declared that it came from Corinth and hence was a forgery; but the Alogi were in Asia Minor about 160 and their negative, if not their positive, evidence has therefore great weight;² (2) the author of the Apocalypse does not style himself an apostle, and nowhere does he designate himself as a personal disciple of Jesus or as an eye-witness; (3) the author speaks (xxi. 14) in such an objective way of the twelve apostles of the Lamb that it is scarcely credible that he himself belonged to them; (4) the descriptions of Christ in the Apocalypse are psychologically scarcely intelligible on the assumption that they were written by a personal disciple of the Lord. On these grounds we must say that, though not quite impossible, it is very improbable that the apostle John was the author of the Apocalypse. But not less improbable is the supposition that the real author wished to pass for the apostle John and fathered the work on him. It is true that amongst the Jews apocalypses were fathered by their authors on famous men; but the fraud is always very patent. But in this case the name of John occurs only four times (i. 1, 4, 9; xxii. 8), and in the whole book there is nothing that reveals the author's intention to pass for the apostle John. And we have further to remember that, according to trustworthy evidence, the apostle John was still living at the time in Asia Minor. It is at least improbable that another dweller in Asia Minor should have fathered a book on him under his very eyes.

In these circumstances only one hypothesis seems left—that started by the Alexandrians in order to get rid of the inconvenient authority of the Apocalypse—that the book is from the pen of another John in Asia Minor, namely, the presbyter. But, though this hypothesis has had much acceptance in our time, it is far from probable; for—and here Zahn and Renan are right—the existence of a conspicuous presbyter John in distinction from the apostle is very uncertain. The Apocalypse, as the traditional text of the first chapter now runs, is certainly not the work of any ordinary person of the name of John: it is by a John who enjoyed the highest consideration in the churches (see i. 1, 4). If besides the apostle John there was no second John who possessed such authority in Asia Minor in the 1st century, and if it is impossible that the Apocalypse can be the work either of the apostle John or of a literary forger, the only supposition left is that the name of John was interpolated in the last revision (after the death of the apostle John). Observe once more that this name occurs only in the first verses of the first chapter, and in a verse of the last. No hypothesis solves the problem so well as this. Whether originally a different name appeared in i. 9, and how ch. i. gradually arose, are questions into which we cannot enter here. In this difficult subject absolute certainty is unattainable, but the supposition that the Revelation was written by an unknown Christian of Asia Minor, and that the name of John is a later addition

in order to ascribe the Revelation to the apostle John, labours under fewer difficulties than any other that has hitherto been started. That, thus introduced, John is not expressly designated as apostle need not surprise us, for at the beginning of the 2d century every one in Asia Minor knew who "John the servant of God" was. The epistles also with the heading "the elder" are meant to be regarded as written by the apostle John, although they do not contain the title apostle.³

Authority in the Church.—The Apocalypse, which as early as the time of Justin and Papias enjoyed a high reputation as the work of the apostle John, was admitted into the canon of the New Testament (see Murat. fragm., Irenæus, Tertullian). In the West it has always been retained in the canon, but in the East it was discredited through Montanism, and the spiritualistic Alexandrians who gave the tone threw more and more doubts upon it, so that towards the end of the 3d century it began to be omitted from the New Testament. For nearly a thousand years the Apocalypse was not recognized by the majority of the Greek Church as a canonical book (and hence it is that we possess so few ancient Greek MSS. of the Apocalypse), but, as no formal condemnation was pronounced against it, the book was never suppressed, and regained its footing towards the end of the Middle Ages, the Greek Church following the example of the Latin. At present the Apocalypse forms part of the New Testament all over Christendom, and rightly so, for it is one of the most instructive documents of early Christianity. Narrow or dogmatic spirits, it is true, will never be able to value it aright, and will therefore either reject it or seek to correct it by false interpretations.

REVERSION. See REMAINDER.

REVIVAL OF LEARNING. See RENAISSANCE.

REWAH, the principal native state in Bâghelkhand, under the political superintendence of the Bâghelkhand and Central India Agencies. It has an area of about 10,000 square miles, and lies between 22° 39' and 25° 12' N. lat., and between 80° 46' and 82° 51' E. long.; it is bounded on the N. by the British districts of Banda, Allahabad, and Mirzapur in the North-Western Provinces; on the E. by Mirzapur district and by native states in Chutia-Nagpur; on the S. by the districts of Chhatisgarh, Mandla, and Jabalpur in the Central Provinces; and on the W. by other native states of Bâghelkhand. Rewah state is divided into two well-defined portions. The northern and smaller division is the plateau lying between the Kaimur range of hills and that portion of the Vindhya

¹ Appeal, however, must not be made to the fact that according to tradition the apostle John was banished to Patmos, and that the author of the Apocalypse says of himself (i. 9), "I was in the isle that is called Patmos for the word of God," for the tradition is based on the Apocalypse, and, what is more, on a misunderstanding of it.

² From Eusebius, *H. E.*, iii. 28, 1 many have assumed that the Roman presbyter Caius (about 200 A.D.) was of the same opinion as the Alogi, but this is improbable.

³ The view here put forward as to the author of the Apocalypse is further recommended by its agreement with the general history of early Christian literature in the church. Originally writings derived their authority from the nature of their contents, afterwards from their author. When writings by obscure persons were intended to attract attention, it was necessary to pass them off under the names of celebrities: see Harnack, *Die Lehre der 12 Apostel*, p. 106 sq.

known as Binjh, which overlook the valley of the Ganges. This plateau is for the most part cultivated and well peopled; the soil varies from a rich black loam to a sandy laterite; but in the greater part of this area good land predominates, and rich harvests both of kharif and rabi crops are generally obtained. Water is plentiful, and the country is full of large tanks and reservoirs, which, however, are not used for irrigation purposes; the only system of wet cultivation which has any favour with the villagers is that of bandhs, or mounds of earth raised at the lower ends of sloping fields to retain the rain water for some time after the monsoon rains cease. The Rewah plateau is reported to possess every natural advantage, and the whole of its area could be brought under rich cultivation. The country to the south of the Kaimur Hills comprises by far the largest portion of the state; but here cultivation is restricted to the valley between the hills and the Sone river, and to a few isolated patches in scattered parts of the wild and magnificent forest wastes. Rewah is rich in minerals and forests. Operations lately undertaken to determine the extent of its coal fields have proved highly successful. Until very recently Rewah possessed no roads to speak of or means of internal communication; but good progress is now being made, and by this means it is anticipated that the state will soon develop its rich resources. The principal river is the Sone, which, receiving the Mahanadi from the south, flows through the state in a north and north-easterly direction into Mirzapur district; another important river is the Tons; but none of the rivers are navigable. The average rainfall at Rewah is about 57½ inches.

The population of the state in 1881 was 1,305,124 (654,182 males, 650,942 females); Hindus in the same year numbered 971,788, Mohammedans 31,107, and aboriginals 302,107. The inhabitants of Rewah are reported to be a singularly simple, pleasant, and well-disposed race, and they greatly appreciate the efforts which are now being made to benefit them. The revenue of the state in 1882-83 amounted to £110,946, of which the land contributed £71,798. The chief town is Rewah, situated in 24° 31' 30" N. lat. and 81° 20' E. long., and containing in 1881 a population of 22,016.

The state came under British influence in 1812, when the first formal treaty was made with Jai Singh Deo, by which he was acknowledged as ruler of his dominions and was brought under the protection of the British Government. The raja, however, failed to fulfil his obligations, and a second treaty was made confirming the first and defining more clearly his relations with the British Government. The administration of Rewah is now entirely in the hands of the British owing to the death of the maharaja Raghuraj Singh and the succession of his infant son.

REYNOLDS, SIR JOSHUA (1723-1792), English portrait-painter, was born at Plympton Earl, in Devonshire, on July 16, 1723. He was educated by his father, a clergyman and the master of the free grammar school of the place, who designed his son for the medical profession. But the boy showed a distinct preference for painting. He was constantly copying the plates in Dryden's *Plutarch* and Cat's *Emblems*, and poring over Jonathan Richardson's *Treatise on Art*. At the age of eight, aided by the instructions in *The Jesuit's Perspective*, he made a sufficiently correct drawing of the Plympton schoolhouse, which greatly astonished his father. It was at length decided that the lad should devote himself to art, and in October 1741 he proceeded to London to study under Thomas Hudson, a mediocre artist, a native of Devonshire, who was popular in the metropolis as a portrait painter. Reynolds remained with Hudson for only two years, acquiring with uncommon aptitude the technicalities of the craft, and in 1743 he returned to Devonshire, where, settling at Plymouth Dock, he employed himself in portrait painting. By the end of 1744 he was again in London. He was well received by his old master, from whom he appears previously to have parted with some cold-

ness on both sides. Hudson introduced him to the artists' club that met in Old Slaughters, St Martin's Lane, and gave him much advice as to his work. Reynolds now painted his portraits of Captain Hamilton, father of the marquis of Abercorn, of Mrs Field, of Alderman Tracey, now in the Plymouth Athenæum, and of the notorious Miss Chudleigh, afterwards duchess of Kingston. To this period, or perhaps to one slightly later, is referable the artist's excellent oval bust portrait of himself, which was included in the Grosvenor Gallery Exhibition of 1884. At Christmas 1746 he was recalled to Plympton to attend the last hours of his father, after whose death he again established himself, now with two of his sisters, at Plymouth Dock, where he painted portraits, and, as he has himself recorded, derived much instruction from an examination of some works by William Gandy of Exeter, whose broad and forcible execution must have been an excellent corrective to the example of Hudson's dry and hard method.

Meanwhile the pleasant urbanity of manner which distinguished Reynolds throughout life had been winning for him friends. He had made the acquaintance of Lord Edgcumbe, and by him was introduced to Captain (afterwards Viscount Keppel), who was to play an important and helpful part in the career of the young painter. Keppel was soon made aware of Reynolds's ardent desire to visit Italy; and, as he had just been appointed to the command of the Mediterranean squadron, he gracefully invited the artist to accompany him in his own ship, the "Centurion." The offer was gladly accepted. While Keppel was conducting his tedious negotiations with the dey of Algiers, relative to the piracy with which that potentate was charged, Reynolds resided at Port Mahon, the guest of the governor of Minorca, painting portraits of the principal inhabitants; and, in December 1749, he sailed for Leghorn, and thence, with all eagerness, made his way to Rome.

He has confessed that his first sight of the works of Raphael was a grievous disappointment, and that it required lengthened study before he could appreciate the correctness and grace of the master. By the dignity and imagination of Michelangelo he was deeply impressed; to the end of life the great Florentine remained for Reynolds the supreme figure in art; his name was constantly upon his lips, and, as he had wished, it was the last that he pronounced to the students of the Royal Academy. Of the influence of Correggio, of his sweetness of expression, of his method of chiaroscuro, we find frequent traces in the works of Sir Joshua, especially in his paintings of children; but after all it was from the Venetians that the English painter learned most. His own strongest instincts were towards richness and splendour of colour, and in these qualities he found unsurpassable examples in the productions of Titian and Veronese.

While in Rome he avoided, as far as possible, the temptation to spend his time in copying specific pictures, which he considered "a delusive kind of industry," by which "the student satisfies himself with an appearance of doing something, and falls into the dangerous habit of imitating without selecting." His method of becoming acquainted with the old masters, and of assimilating their excellences, was by diligent examination and comparison, aided by studies of general effect and of individual parts. His knowledge of the Roman art treasures was dearly purchased. While working in the corridors of the Vatican he caught a severe cold, which resulted in the deafness that clung to him for the rest of his life, and rendered necessary the ear-trumpet which he used in conversation.

After a residence of two years in Rome, Reynolds, in the spring of 1752, spent four months in visiting Parma, Florence, Venice, and other important cities of Italy; and, after a brief stay in Devonshire, he established himself as

a portrait painter in St Martin's Lane, London, whence he afterwards removed to Great Newport Street, and finally, in 1760, to Leicester Square, where he continued to paint till his death.

His first reception on his return was hardly a favourable one. Hudson called to see his productions and told him, "Reynolds, you don't paint so well as when you left England." Ellis, another accepted portrait painter of the time, who had studied under Kneller, exclaimed, "This will never answer. Why, you don't paint in the least like Sir Godfrey,"—adding, as he abruptly left the room, "Shakespeare in poetry, Kneller in painting." The verdict of the public, however, was all on the side of the young innovator. Lord Edgcumbe played the part of the generous patron, and exerted himself to obtain commissions for his protégé, of whose ability the portraits which he now produced—of the duchess of Hamilton, the countess of Coventry, Lord Holderness, and especially of his old friend Keppel—were sufficient guarantee. The artist's painting-room was thronged with the wealth and fashion of London, "with women who wished to be transmitted as angels, and with men who wished to appear as heroes and philosophers"; and he was already afloat upon that tide of prosperity which never ebbed till the day of his death. Various other artists contested with him for popular applause. First the Swiss Liotard had his moment of popularity; and at a later period there was Opie, and the more formidable and sustained rivalry of Gainsborough and of Romney; but in the midst of all, then as now, Reynolds maintained an admitted supremacy. And, if the magic of his brush brought him crowds of sitters, his charm of manner gathered round him numerous friends. During the first year of his residence in London he had made the acquaintance of Dr Johnson, which, diverse as the two men were, became a friendship for life. To him Burke and Goldsmith, Garrick, Sterne, Bishop Percy, and, it seems, Hogarth, were before long added. At the hospitable dinner table of Reynolds such distinguished men enjoyed the freest and most unconstrained companionship, and most of them were members of the "Literary Club," established, at the painter's suggestion, in 1764.

In 1760 the London world of art was greatly interested by the novel proposal of the Society of Artists to exhibit their works to the public. The hall of the society was at their disposal for the purpose; and in the month of April an exceedingly successful exhibition was opened, the precursor of many that followed. To this display Reynolds contributed four portraits. In 1765 the association obtained a royal charter, and became known as "The Incorporated Society of Artists"; but much rivalry and jealousy was occasioned by the management of the various exhibitions, and an influential body of painters withdrew from the society, and proceeded to consider the steps that should be taken in order that their corporate existence might be recognized. They had access to the young king, George III., who promised his patronage and help. In December 1768 the Royal Academy was founded, and Reynolds was elected, by acclamation, its first president, an honour which more than compensated for his failure to obtain the appointment of king's painter, which, the previous year, had been bestowed on Allan Ramsay, a more courtly but more commonplace artist. In a few months the king signified his approval of the election by knighting the new president, and intimating that the queen and himself would honour him with sittings for portraits to be presented to the Academy.

Reynolds was fitted for his new position no less by his urbane and courteous manner and by his wide general culture than by his eminence as an artist. With unwearied

assiduity, with unfailing tact, he devoted himself to furthering the interests of the new Academy. It was at his suggestion that the annual banquet was instituted. To the specified duties of his post he added the delivery of a presidential address at the distribution of the prizes, and his speeches on these occasions form the well-known "discourses" of Sir Joshua. Expressed as they are with simple elegance and perspicuous directness, these discourses alone would be sufficient to entitle their author to literary distinction; indeed, when they were first delivered, it was thought impossible that they could be the production of a painter, and Johnson and Burke have been credited with their composition, in spite of the specific denials of both, and of Dr Johnson's indignant exclamation—"Sir Joshua, sir, would as soon get me to paint for him as to write for him!"

In the unwearied pursuit of his art, and in the calm enjoyment of his varied friendships, Sir Joshua's life flowed on peacefully and happily enough. He was too prosperous and successful an artist altogether to escape the jealousy of his less fortunate and less capable brethren, and he suffered in this way sometimes, especially from the attacks of Barry, a painter who lived long enough to regret and, so far as he was able, to rectify his fault. In 1784, on the death of Ramsay, Reynolds was appointed painter to the king. Two years previously he had suffered from a paralytic attack; but, after a month of rest, he was able to resume his painting with unabated energy and power. In the summer of 1789 his sight began to fail; he was affected by the *gutta serena*, but the progress of the malady was gradual, and he continued occasionally to practise his art till about the end of 1790. His last years were embittered by a most unfortunate disagreement with the Royal Academy, relative to the appointment of a professor of perspective. Under the impression that there was a conspiracy against him among the various members, he signified his intention of leaving the presidential chair, a resignation which he was afterwards induced to withdraw, and his final discourse was delivered on the 10th December 1790. He was still able to enjoy the companionship of his friends, and he exerted himself in an effort to raise funds for the erection of a monument in St Paul's to Dr Johnson, who had died in 1784. Towards the end of 1791 it was evident to the friends of Reynolds that he was gradually sinking. For a few months he suffered from extreme depression of spirits, the result of a severe form of liver complaint, and on the 23d February 1792 this great artist and blameless gentleman passed peacefully away.

Reynolds's first discourse deals with the establishment of an academy for the fine arts, and of its value as being a repository of the traditions of the best of bygone practice, of "the principles which many artists have spent their lives in ascertaining." In the second lecture the study of the painter is divided into three stages,—in the first of which he is busied with processes and technicalities, with the grammar of art, while in the second he examines what has been done by other artists, and in the last compares these results with nature herself. In the third discourse Reynolds treats of "the great and leading principles of the grand style"; and succeeding addresses are devoted to such subjects as "Moderation," "Taste," "Genius," and "Sculpture." The fourteenth has an especial interest as containing an appreciative but discriminating notice of Gainsborough, who had died shortly before its delivery; while the concluding discourse is mainly occupied with a panegyric on Michelangelo.

The other literary works of the president comprise his three essays in *The Idler* for 1759–60 ("On the Grand Style in Painting," and "On the True Idea of Beauty"), his notes to Du Fresnoy's *Art of Painting*, his *Remarks on the Art of the Low Countries*, his brief notes in Johnson's *Shakespeare*, and two singularly witty and brilliant fragments, imaginary conversations with Johnson, which were never intended by their author for publication, but, found among his papers after his death, were given to the world by his niece, the marchioness of Thomond.

But the literary works of Reynolds, excellent as these are, were

the occupation of his mere bye hours and times of leisure. The main effort of his life was directed to painting, a pursuit which, as he was never weary of impressing on younger artists, was enough to occupy a man's whole time, even were it longer than it is, and to call forth his utmost energy. The unceasing application, perseverance, and assiduity which form the recurrent burden of Reynolds's discourses found the most complete illustration in his own career. He laid it down as a distinct principle that each fresh portrait to which he set his hand should excel the last, and no effort was wanting to realize this aim. In his search for perfection he would paint and repaint a subject; when a visitor asked how a certain portion of the infant Hercules had been executed, he replied, "How can I tell! There are ten pictures below this, some better, some worse." A method like this contrasts curiously with the swift certainty of Gainsborough's practice, but it must be confessed that the productions of Reynolds have an abiding charm that is wanting in the exquisite but slighter and more mannered work of his great rival. In range, too, of subject, as well as of method, the art of Sir Joshua has by far the wider reach. "How various the man is," said Gainsborough once, after he had been examining the president's portraits hung in an Academy exhibition; and the remark gains an added point and emphasis when we compare the paintings of Reynolds with Gainsborough's own.

In the work which the painter produced shortly after his return from Italy—in the Lady Cathcart and her Daughter of 1755, the Lady Elizabeth Montague and the George, Earl of Warwick, of 1756, and the Countess of Hyndford of 1757—we find a certain dignity and elegance of pose and arrangement which bears witness to his foreign studies, joined to some coldness of colour, hardness of execution, and insistence on definiteness of outline, which contrasts with the sweet felicity and tenderness of his fully developed manner, with its perfect colour, and its form which is lost and found again in an exquisite mystery. But soon all that is tentative and immature disappears from his works. In 1758 we have the gracious and winning full-length of Elizabeth Gunning, Duchess of Hamilton, and the stately Duke of Cumberland, followed in 1760 by the Kitty Fisher, and a host of admirable portraits in which the men and women and children of the time live still before our eyes, each possessed with a nameless dignity, or grace, or sweetness. As the artist advanced towards old age his hand only gained in power, his colour in richness and splendour; his works show no decadence till the day when he finally laid aside his brush. We have nothing finer from his hand than the Mrs Nesbitt as Circe of 1781, the Mrs Siddons as The Tragic Muse of 1784, the Duchess of Devonshire and her Child of 1786, and the Infant Hercules and the Miss Gawtkin as Simplicity of 1788.

In the midst of his constant practice as a portrait-painter Reynolds was true to his early admiration of "the grand style," to his veneration for the old masters of Italy, to his belief that the imaginative paths which these men pursued were the highest ways of art. At the conclusion of his last Academy discourse, while speaking of Michelangelo, he breaks forth with uncontrollable emotion, "Were I now to begin the world again, I would tread in the steps of that great master; to kiss the hem of his garment, to catch the slightest of his perfections, would be glory and distinction enough for an ambitious man."

From the Italians Reynolds conveyed into his own portrait-subjects a dignity and a grace, along with a power of colour, which were previously unknown in English art; but he essayed also to follow them into their own exalted and imaginative paths, to paint Holy Families and Nativities, to picture the cardinal virtues, and to realize the conceptions of the poets. But the English portrait-painter wanted the visionary power necessary for such tasks; his productions of this class form the least interesting portion of his work. They are most successful when the symbolism and the allegory in them are of the slightest, when the human element is the main attraction, when he paints as cherub faces five different views of the countenance of one living English girl, or titles as "Simplicity" his portrait of Offy Gawtkin or as "Hebe" his portrait of Miss Meyer. His series of "The Virtues," designed for the window of New College, Oxford, show simply studies of graceful women, lightly draped, and pleasantly posed. His Macbeth and his Cardinal Beaufort have no real impressiveness, no true terror; and the finest of the subjects that he painted for Boydell's *Shakespeare* is the Puck, in which the artist's inspiration was caught, not from the realms of imagination or fancy, but from observation of the child nature which he knew and loved.

Much has been said regarding the recklessness and want of care for permanency which characterized the technical methods of Sir Joshua. While he insisted that his pupils should follow only such ways of work as were well known and had been tested by time, he was himself most varying and unsettled in his practice. In his earnest desire for excellence he tried all known processes, and made all kinds of fantastic experiments. He was firmly convinced that the old masters were possessed of technical secrets which had been lost in later times, and he even scraped the surfaces from portions of valuable works by Titian and Rubens in the vain attempt to

probe the mystery. In his efforts to attain the utmost possible power and brilliancy of hue he made use of pigments which are admittedly the reverse of stable and permanent, he worked with dangerous vehicles, he employed both colours and varnishes which in combination are antagonistic. Orpiment was mingled with white lead; wax-medium, egg-varnish, and asphaltum were freely used; and, when we read the account of his strangely hap-hazard methods, we are ready to echo Haydon's exclamation—"The wonder is that the picture did not crack beneath the brush!" and are prepared for such a sight of the vanishing ghosts of masterpieces as was afforded by so many works in the Reynolds Exhibition at the Grosvenor Gallery in 1884. Our only consolation lies in the truth expressed by Sir George Beaumont, when his recommendation of Sir Joshua for the execution of a certain work was met by the objection that his colours faded, that he "made his pictures die before the man." "Never mind," said Sir George, "a faded portrait by Reynolds is better than a fresh one by anybody else."

(1866). (J. M. G.)

RHADAMANTHUS, in Greek mythology, a son of Zeus and Europa and brother of Minos, king of Crete. At first he helped his brother to rule his island empire. His justice earned him the admiration of his subjects and the jealousy of his brother, wherefore he fled to Boeotia, where he wedded Alcmena. On account of his inflexible integrity he was made one of the judges of the dead in the other world. According to Plato, Rhadamanthus judged the souls of Asiatics, while Æacus judged those of Europeans, and when they could not agree Minos had a casting vote.

RHÆTIA was the name given in ancient times to a province of the Roman empire, which included a considerable tract of the Alpine regions that separated the great valleys of the Po and the Danube, comprising the districts occupied in modern times by the Grisons and the Austrian province of Tyrol. Before their subjugation by Rome the Rhætians are described as one of the most powerful and warlike of the Alpine tribes; but little or nothing is known as to their origin and history. It is indeed stated distinctly by Livy (v. 33) that they were of Etruscan origin, and a tradition reported by Justin (xx. 5) and Pliny (*H.N.*, iii. 24, 133) affirmed that they were a portion of that people who had been settled in the plains of the Po and were driven into the mountains by the irruption of the Gauls, when they assumed the name of Rhætians from a leader of the name of Rhætus. Very little value can, however, be attached to such traditions, and the attempts of some modern writers to support them by philological researches have led to no satisfactory result. But the ethnical connexion of the Rhætians with the Etruscans has been accepted by Niebuhr, and its general reception by the Romans would seem to prove that they were a distinct race from their neighbours the Ligurians as well as from the Gauls and Germans.

The name of the Rhætians is first mentioned by Polybius, but merely incidentally, and they played no part in Roman history till after the fall of the republic. It is certain, however, that they continued virtually independent until Augustus undertook their subjugation, in common with that of the neighbouring Alpine tribes bordering upon Italy. The importance he attached to this task is shown by his having deputed its execution to his two step-sons, Drusus and Tiberius, who in a single campaign reduced them all to subjection (15 B.C.), so that their territory was shortly after incorporated as a province in the Roman empire and their name never again appears in history. The exploits of the imperial youths on this occasion have been immortalized in two well-known odes of Horace (*Od.*, iv. 4 and 14). In the time of Strabo their territory was considered as extending from the Lakes of Como and Garda to that of Constance (the Lacus Brigantinus), while the allied people of the Vindelici, who had shared in their

contest against the Roman arms, as well as in their final subjugation, extended down the northern slope of the Alps as far as the Danube. By far the greater part of this extensive region was occupied by rugged mountains, the inhabitants of which, when compelled to abandon their predatory habits, subsisted principally upon the produce of their flocks. Some of the valleys, however, which extended on the south side down to the plains of Italy, were rich and fertile, and produced excellent wine, which was considered equal to any of those grown in Italy itself. The most important of these valleys was that of the Adige, which descends from the high Alps adjoining the Brenner to Verona; of this the upper portions were held by the Breuni, whose name is still perpetuated in that of the Brenner, while the lower and more fertile region was occupied by the Tridentini, whose chief town of Tridentum was the same as the now celebrated city of Trent. The next people towards the west were the Triumpilini, in the valley still known as Val Trompia; the Camuni in Val Camonica; the Orobii, who appear to have occupied the Val Tellina and adjoining districts; and the Lepontii, between the Lago Maggiore and the Pennine Alps. The tribes in the interior and heart of the mountain ranges cannot be for the most part assigned to definite localities. The Genauni, mentioned by Horace as well as by Strabo, are supposed to have occupied the Val di Non, and the Vennonese or Venostes the lofty ranges near the source of the Adige.

The boundaries of the Roman province were repeatedly changed. At first it appears to have comprised all Vindelicia, so as to have extended to the Danube from its sources to its confluence with the Inn, which constituted its eastern boundary on the side of Noricum. But at a later period this northern tract was separated from the central mountain region, and the two were named Rætia Prima and Rætia Secunda, in which form they appear in the *Notitia*. At the same time the southern valleys were gradually incorporated with Italy and assigned to the territory of the neighbouring municipal towns. Thus Tridentum, which was originally a Rætian town, came to be included in Venetia, and is assigned by Pliny to the tenth region of Italy. The only important town in the northern part of the province was the Roman colony of Augusta Vindelicorum, which still retains the name of Augsburg. The same is the case with Curia, now Chur or Coire, the capital of the Grisons, and Brigantia (Bregenz), which gave name in ancient times to the lake now called the Lake of Constance.

The province of Rætia was traversed by two great lines of Roman roads,—the one leading from Verona and Tridentum (Trent) across the pass of the Brenner to Innsbruck (Pons Cœni), and thence to Augsburg (Augusta Vindelicorum), and the other from Bregenz on the Lake of Constance, by Coire and Chiavenna, to Como and Milan.

RHAPSODIST. See HOMER, vol. xii. p. 109 sq.

RHAZES. See MEDICINE, vol. xv. p. 805.

RHEA, the name given in 1752 by Möhring¹ to a South-American bird which, though long before known and described by the earlier writers—Nieremberg, Marcgrave, and Piso (the last of whom has a recognizable but rude figure of it)—had been without any distinctive scientific appellation. Adopted a few years later by Brisson, the name has since passed into general use, especially among English authors, for what their predecessors had called the American Ostrich; but on the European continent the bird is commonly called *Nandu*,² a word corrupted from a

name it is said to have borne among the aboriginal inhabitants of Brazil, where the Portuguese settlers called it *Ema* (cf. EMEU, vol. viii. p. 171). The resemblance of the Rhea to the OSTRICH (vol. xviii. p. 62) was at once perceived, but the differences between them were scarcely less soon noticed, for some of them are very evident. The former, for instance, has three instead of two toes on each foot, it has no apparent tail nor the showy wing-plumes of the latter, and its head and neck are clothed with feathers, while internal distinctions of still deeper significance have since been dwelt upon by Prof. Huxley (*Proc. Zool. Society*, 1867, pp. 420–422) and the late Mr W. A. Forbes (*op. cit.*, 1881, pp. 784–787), thus justifying the separation of these two forms more widely even than as Families; and there can be little doubt that they should be regarded as types of as many Orders—*Struthionese* and *Rhesæ*—of

Rhea.

the Subclass *Ratitæ*.³ Structural characters no less important separate the Rheas from the Emeus, and, apart from their very different physiognomy, the former can be readily recognized by the rounded form of their contour-feathers, which want the *hyporrhachis* or after-shaft that in the Emeus and Cassowaries is so long as to equal the main shaft, and contributes to give these latter groups the appearance of being covered with shaggy hair. Though the Rhea is not decked with the graceful plumes which adorn the Ostrich, its feathers have yet a considerable market value, and for the purpose of trade in them it is annually killed by thousands, so that it has been already extirpated from much of the country it formerly inhabited,⁴ and its total

¹ What prompted his bestowal of this name, so well known in classical mythology, is not apparent.

² The name *Touyou*, also of South-American origin, was applied to it by Brisson and others, but erroneously, as Cuvier shews, since by that name, or something like it, the JABIRU (vol. xiii. p. 529) is properly meant.

³ *Ann. Nat. History*, ser. 4, xx. p. 500.

⁴ Mr Harting, in his and Mr De Mosenthal's *Ostriches and Ostrich Farming*, from which the woodcut here introduced is by permission copied, gives (pp. 67–72) some portentous statistics of the destruction of Rheas for the sake of their feathers, which, he says, are known in the trade as "Vautour" to distinguish them from those of the African bird.

extinction as a wild animal is probably only a question of time. Its breeding habits are precisely those which have been already described in the case of other Ratite birds. Like most of them it is polygamous, and the male performs the duty of incubation, brooding more than a score of eggs, the produce of several females—facts known to Nieremberg more than two hundred and fifty years since, but hardly accepted by naturalists until recently. From causes which, if explicable, do not here concern us, no examples of this bird seem to have been brought to Europe before the beginning of the present century, and accordingly the descriptions previously given of it by systematic writers were taken at second hand and were mostly defective if not misleading. In 1803 Latham issued a wretched figure of the species from a half-grown specimen in the Leverian Museum, and twenty years later said he had seen only one other, and that still younger, in Bullock's collection (*Gen. Hist. Birds*, viii. p. 379).¹ A bird living in confinement at Strasburg in 1806 was, however, described and figured by Hammer in 1808 (*Ann. du Muséum*, xii. pp. 427–433, pl. 39), and, though he does not expressly say so, we may infer from his account that it had been a captive for some years. In England the *Report* of the Zoological Society for 1833 announced the Rhea as having been exhibited for the first time in its gardens during the preceding twelvemonth. Since then many other living examples have been introduced, and it has bred both there and elsewhere in Britain, but the young do not seem to be very easily reared.²

Though considerably smaller than the Ostrich, and, as before stated, wanting its fine plumes, the Rhea in general aspect far more resembles that bird than the other *Ratitæ*. The feathers of the head and neck, except on the crown and nape, where they are dark brown, are dingy white, and those of the body ash-coloured tinged with brown, while on the breast they are brownish-black, and on the belly and thighs white. In the course of the memorable voyage of the "Beagle," Darwin came to hear of another kind of Rhea, called by his informants *Avestruz petise*, and at Port Desire on the east coast of Patagonia he obtained an example of it, the imperfect skin of which enabled Mr Gould to describe it (*Proc. Zool. Society*, 1837, p. 35) as a second species of the genus, naming it after its discoverer. *Rhea darwini* differs in several well-marked characters from the earlier known *R. americana*. Its bill is shorter than its head; its tarsi are reticulated instead of scutellated in front, with the upper part feathered instead of being bare; and the plumage of its body and wings is very different, each feather being tipped with a distinct whitish band, while that of the head and neck is greyish-brown. A further distinction is also asserted to be shewn by the eggs—those of *R. americana* being of a yellowish-white, while those of *R. darwini* have a bluish tinge. Some years afterwards Mr Selater described (*op. cit.*, 1860, p. 207) a third and smaller species, more closely resembling the *R. americana*, but having apparently a longer bill, whence he named it *R. macrorhyncha*, more slender tarsi, and shorter toes, while its general colour is very much darker, the body and wings being of a brownish-grey mixed with black. The precise geographical range of these three species is still undetermined. While *R. americana* is known to extend from Paraguay and southern Brazil through the state of La Plata to an uncertain distance in Patagonia, *R. darwini* seems to be the proper inhabitant of the country last named, though

M. Claraz asserts (*op. cit.*, 1885, p. 324) that it is occasionally found to the northward of the Rio Negro, which had formerly been regarded as its limit, and, moreover, that flocks of the two species commingled may be very frequently seen in the district between that river and the Rio Colorado. On the "pampas" *R. americana* is said to associate with herds of deer (*Cariacus campestris*), and *R. darwini* to be the constant companion of guanacos (*Lama huanaco*)—just as in Africa the Ostrich seeks the society of zebras and antelopes. As for *R. macrorhyncha*, it was found by Forbes (*Ibis*, 1881, pp. 360, 361) to inhabit the dry and open "sertões" of north-eastern Brazil, a discovery the more interesting since it was in that part of the country that Marcgrave and Piso became acquainted with a bird of this kind, though the existence of any species of Rhea in the district had been long overlooked by or unknown to succeeding travellers.

Besides the works above named and those of other recognized authorities on the ornithology of South America such as Azara, Prince Max of Wied, Prof. Burmeister, and others, more or less valuable information on the subject is to be found in Darwin's *Voyage*; Dr Böcking's "Monographie des Nandu" in (Wiegmann's) *Archiv für Naturgeschichte* (1863, i. pp. 213–241); Prof. R. O. Cunningham's *Natural History of the Strait of Magellan* and paper in the Zoological Society's *Proceedings* for 1871 (pp. 105–110), as well as Dr Gadow's still more important anatomical contributions in the same journal for 1885 (pp. 308 sq.). (A. N.)

RHEA (or RHEEA) FIBRE is a textile material yielded by one or more species of *Böhmeria* (nat. ord. *Urticaceæ*), plants found over a wide range in India, China, the Malay Peninsula and islands, and Japan. Rhea is also capable of being grown in temperate latitudes, and has been experimentally introduced into the south of France and Algeria. The most important source of rhea fibre, known also very inappropriately as China grass, or by its Malay name Ramie, is *B. nivea*. It is a shrubby plant growing to the height of from 5 to 8 feet with foliage and inflorescence like the common nettle, but destitute of stinging hairs. Some authorities consider the variety cultivated in China to be specifically distinct from the Indian plant. An allied plant called Pooah or Puya, *B. Puya*, found growing wild in the north of India, is also a source of rhea fibre. Among the Chinese much care is bestowed on the cultivation of Chu or Tchou Ma, as rhea is called by them, and they prepare the fibre by a tedious and costly process of selection and manual labour. The plant thrives in hot, moist, shaded situations; propagated from slips or root cuttings, it throws up from three to five crops of stems in the course of a season, although not more than three crops are commonly reckoned on. Each such crop may yield about 250 lb of marketable fibre per acre, that total output being exceeded only by the jute crop. The stems when ripe are cut down, stripped of leaves and branchlets, and, either split or whole, are freed from their cortical layers till the bast layer is exposed. In this state they are made up in small bundles and placed where they receive strong sunlight by day and dews by night for several days, after which the fibrous bast layer is peeled with ease off the woody core, and the separated fibres are thereafter treated with boiling water to remove as far as possible adherent gummy and resinous matter in which the fibres are embedded in the stalks. The fibre so obtained is usually bleached by exposure on the grass, and it comes into the market as brilliant white filaments with a fine silky gloss, having a strength, lustre, and smoothness unequalled by any other vegetable fibre.

The fibre first appeared in the European market in 1810, and a cord then spun from it was found to sustain a weight of 252 lb, while a similar cord of Russian hemp was estimated by Admiralty test not to bear more than 87 lb. A fibre possessed of such strength and beauty immediately attracted great attention, and throughout the early half of the century numerous efforts were made by the East India Company to introduce it as a textile staple. But many diffi-

¹ The ninth edition of the *Companion* to this collection (1810, p. 121) states that the specimen "was brought alive" [? to England].

² Interesting accounts of the breeding of this bird in confinement are given, with much other valuable matter, by Mr Harting in the work already cited.

sulties have been encountered in its working, some of which are not yet overcome. The fibre itself is very difficult of extraction owing to the large amount of adhesive matter in which it is embedded, and it is proportionately so expensive that it practically comes into competition only with silk and wool. Further, rhea is hard and inelastic, and on the machinery adapted for spinning other textiles it can only be spun into a rough, harsh, and hairy yarn, while fabrics into which it is woven are rigid, and show permanent creases at every fold. In the form of cordage, moreover, it cuts and gives way at sharp knots and twists. Notwithstanding all disappointments and drawbacks, the Indian Government considered the fibre of such importance that in 1869 two prizes of £5000 and £2000 and again in 1877 prizes of £5000 and £1000 were offered for machinery or processes by which the fibre could be prepared at such a cost per ton as would render its introduction into the market practicable. Competitive trials were made at Saharanpur in 1872 and 1879, but no machine was found to satisfy the conditions of success, although in 1872 a reward of £1500 was granted to Mr John Greig, jun., of Edinburgh, and in 1879 £500 and £100 respectively were paid to two of the competitors. The extraction of rhea continues to attract attention, and quite recently (1885) it has been announced that Prof. Frémy of Paris, assisted by M. Urbain, has successfully overcome all difficulties. The raw material used by Prof. Frémy is obtained by a process devised by M. Favier, which consists in submitting the newly cut stems to low-pressure steam for twenty minutes, after which the whole rind is separated in ribands from its woody core with the utmost ease. These ribands are then dried, and on them Prof. Frémy operates with alkaline solutions which are varied in strength according to the appearance of the material dealt with, and a pure fibre in fine working condition is thus obtained. Rhea has yet to establish its position among European textiles, but in the East its value is well recognized. It is extensively used for cordage, fishing nets, &c.; and it is very little affected by water. The Chinese prepare an exceedingly fine "grass cloth" from single filaments of rhea, knotted or gummed end to end in the way they employ the finest filaments of Manila hemp for making "Pina" gauze.

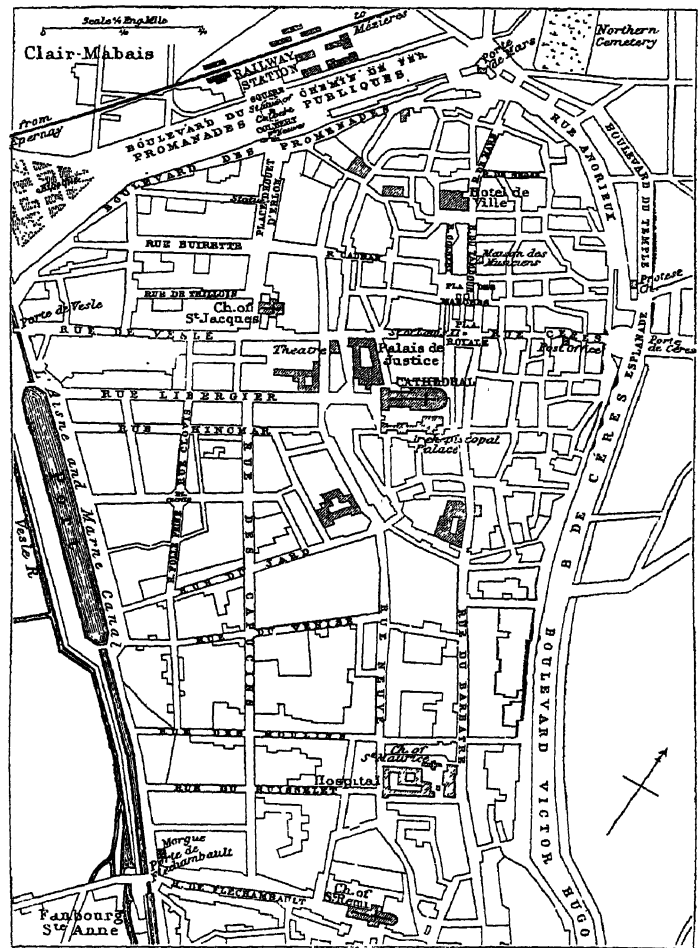

RHEGIUM. See REGGIO.

RHEIMS, a city of France, chief town of an arrondissement of the department of Marne, lies 81 miles east-north-east of Paris (99 miles by rail) on the right bank of the Vesle, a tributary of the Aisne, and on the canal which connects the Aisne with the Marne. To the south and west rise the "montagne de Rheims" and the vine-clad hills where the wine is grown which constitutes the chief object of the industry and commerce of the town. Rheims has been, since the last Franco-Prussian War, surrounded with detached forts that render it a great entrenched camp, and it still preserves eleven of the gates of its old enceinte, that of Paris, constructed on occasion of the coronation of Louis XVI., being specially noticeable. Beyond the boulevards the town spreads out in several suburbs—the faubourgs of St Anne on the south, Vesle on the west, Laon on the north-west, and Cérés on the north-east. The town is well planned and built, and its streets are traversed by tramways.

The spinning and weaving of wool is carried on in seventy factories, employs 10,000 hands, and annually turns £3,500,000 worth of the raw material into flannels, merinoes, cloth, blankets, &c. Dyeing and "dressing" are carried on in the outskirts of the town. Fifty firms with 2000 workmen are employed in the champagne manufacture; the cellars are vast excavations in the chalk rock. Rheims is also famous for its biscuits, gingerbread, and dried pears. Machinery, chemical products, candles, soap, stained glass, common glass, and paper are also manufactured. In respect of population (93,683 in 1881) Rheims ranks as the eleventh city of France.

The oldest monument in Rheims is the Mars Gate (so called from a temple to Mars in the neighbourhood), a triumphal arch 108 feet in length by 43 in height erected by the Remi in honour of Cæsar and Augustus when Agrippa made the great roads terminating at the town. In its vicinity a curious mosaic measuring 35 feet by 26, with thirty-five medallions representing animals and gladiators, was discovered in 1861. But by far the most interesting architectural feature of the town is the cathedral of Notre Dame, where the kings of France used to be crowned. It replaced an older church burned in 1211, which had been built on the site of the basilica where Clovis was baptized by St Remigius.

The whole cathedral, with the exception of the façade, was completed by 1231; but it has undergone numerous alterations. The present façade was erected in the 14th century after 13th-century designs,—the nave having in the meantime been lengthened so as to afford room for the vast crowds that attended the coronations. In 1481 a terrible fire destroyed the roof and also the spires, which have never been restored to their original state. In 1875 the National Assembly voted £80,000 for repairs of the façade and balustrades. This façade is the finest portion of the building, and one of the most perfect masterpieces of the Middle Ages. The portals and the rose window are laden with statues and statuettes; the "gallery of the kings" above has the baptism of Clovis in the centre, and also statues of Charlemagne and his father Pippin the Short. The towers, 267 feet high, were originally designed to rise 394 feet; that on the south contains two great bells, one of which, named by Cardinal de Lorraine in 1570, weighs more than 11 tons. The transepts are also decorated with sculptures,—that on the north with statues of the principal bishops of Rheims, a representation of the last judgment, and a figure of Christ, while that on the south side has a beautiful rose window with the

Plan of Rheims.

prophets and apostles. Of the four towers which formerly flanked the transepts nothing remains above the height of the roof since the fire of 1481. Above the choir rises an elegant bell-tower in timber and lead, 59 feet high, reconstructed in the 15th century. The interior of the cathedral is 455 feet long, 98½ feet wide in the nave, and 125 feet high in the centre. It has a profusion of statues similar to those of the outside, and is further adorned with stained glass of the 13th century and with tapestries. The rose window over the main portal and the gallery beneath are of rare magnificence. Forty pieces of tapestry bestowed in 1530 by Robert de Lenoncourt, and devoted to the history of the Virgin, are remarkable for the richness of colour and the variety of costume they display. Of six pieces presented by Cardinal de Lorraine in 1570, only three have been preserved; one of them representing the coronation of Clovis and the battle of Soissons affords valuable evidence relating to the military costumes of the 16th century. Archbishop Henry of Lorraine also presented seventeen large pieces of tapestry representing the life of Christ, in 1633; they are called Pepersack's tapestries after the maker, a celebrated tapestry

weaver of Charleville. The Canticles tapestries, four pieces representing scenes in Louis XIV.'s youth, originally belonged to the castle of Hauteville. In the right transept are two great Gobelins tapestries executed after Raphael's designs, and dealing with the life of St Paul. The left transept contains a fine organ in flamboyant Gothic with 3516 pipes and 53 stops. The choir clock is ornamented with curious mechanical devices. Several paintings, by Titian, Tintoretto, Nicolas Poussin, and others, and the carved woodwork and the railings of the choir, also deserve to be mentioned; and among the numerous objects of antiquarian interest in the cathedral "treasury" is the reliquary of the sacred phial which contained the oil used in anointing the kings, but was broken during the Revolution. The archiepiscopal palace, built between 1498 and 1509, and in part rebuilt in 1675, was occupied by the kings on the occasion of their coronation. The saloon chamber, where the royal banquet was held, has an immense stone chimney of the 15th century, medallions of the archbishops of Rheims, and portraits of fourteen kings crowned in the city. Among the other rooms of the royal suite, all of which are of great beauty and richness, is that now used for the meetings of the Rheims Academy; the building also contains a library of 16,000 volumes. The chapel of the archiepiscopal palace consists of two stories, the upper of which still serves as a place of worship, while the lower is occupied by an antiquarian museum, in which is preserved the marble cenotaph (almost entire) of the consul Jovinus, who in the 4th century led his fellow-townsmen at Rheims to embrace Christianity. After the cathedral the most celebrated church is that of St Remi, built in the 11th and 12th centuries on the site of an older place of worship. The valuable monuments with which it was at one time filled were pillaged during the Revolution, and even the tomb of the saint is a modern piece of work; but there still remain the 13th-century glass windows of the apse and tapestries representing the history of St Remigius. The churches of St Jacques, St Maurice (partly rebuilt in 1867), St André, and St Thomas (erected in 1847, under the patronage of Cardinal Gousset, now buried within its walls), as well as the chapels of the lycée and of several monasteries, are all more or less interesting. There are also in the city two Protestant churches and a synagogue.

The town-house, erected in the 17th century and enlarged in 1880, has a pediment with an equestrian statue of Louis XV. and a tall and elegant campanile. It contains a picture gallery, a natural history museum, and a library of 60,000 volumes and 1500 MSS. Of the many curious old houses which still exist in the town it is enough to mention the House of the Musicians, so called from the seated figures of musicians which decorate the front. Rheims is the seat of an academy of science, arts, and literature, founded in 1841 and composed of forty-five members, a preparatory school of medicine and pharmacy, several hospitals, and a modern theatre. It is the headquarters of one of the divisions of the 6th corps d'armée (Châlons). Colbert's statue adorns the Cours; Louis XV.'s (in bronze) stands in the centre of the handsome Place Royale; and Marshal Drouet d'Erlon's is in another of the public squares.

History.—Rheims (Durocortorum), an important town in the time of Cæsar, made voluntary submission to the Romans and by its fidelity throughout the various Gallic insurrections secured the special favour of its conquerors. Christianity was introduced about the middle of the 4th century. Jovinus, already mentioned as an influential supporter of the new faith, repulsed the barbarians who invaded Champagne in 336; but the Vandals captured the town in 406 and slew St Nicasus, and Attila afterwards put everything to fire and sword. Clovis, after his victory at Soissons (486), was baptized at Rheims in 496 by St REMIGIUS (*q.v.*). From this period the see acquired new lustre. The kings of the second and third dynasties desired to be consecrated at Rheims with the oil of the sacred phial which was believed to have been brought from heaven by a dove for the baptism of Clovis and was preserved in the abbey of St Remi. Historical meetings of Pope Stephen III. with Pippin the Short, and of Leo III. with Charlemagne, took place at Rheims; and there Louis the Debonnaire was crowned by Stephen IV. In the 10th century Rheims had become a centre of intellectual culture, Archbishop Adalberon, seconded by the monk Gerbert (Sylvester II.), having founded schools where the "liberal arts" were taught. Adalberon was also one of the prime authors of the revolution which put the Capet house in the place of the Carolingians. The archbishops of Rheims held the temporal lordship of the city and coined money till the close of the 14th century. But their most important prerogative was the consecration of the king,—a privilege which was regularly exercised from the time of Philip Augustus to that of Charles X. Louis VII. granted the town a communal charter in 1139. Councils met within its walls in 1119 and 1148. The treaty of Troyes (1420) ceded it to the English, who had made a futile attempt to take it by siege in 1360; but they were expelled on the approach of Joan of Arc, who in 1429 caused Charles VII. to be duly consecrated in the cathedral. A revolt at Rheims caused by the salt tax in 1461 was cruelly repressed by

Louis XI. The town sided with the League (1585), but submitted to Henry IV. after the battle of Ivry. In the foreign invasions of 1814 it was captured and recaptured; in 1870-71 it was made by the Germans the seat of a governor-general and impoverished by heavy requisitions.

RHEINGAU. See **RHINE**.

RHENANUS, BEATUS (c. 1485-1547), German humanist, was born about 1485 at Schlettstadt in Alsace, where his father, a native of Rheinau, was a prosperous butcher. He received his early education in Schlettstadt, and afterwards (1503) went to Paris, where he came under the influence of Faber Stapulensis; here, among his other learned pursuits, we must include that of correcting the press for Henry Estienne. In 1511 he removed to Basel, where he became intimate with Erasmus, and took an active share in the publishing enterprises of Frobenius. Some time after 1520 he became a comparatively wealthy man through the death of his father; returning to Schlettstadt he devoted himself to a life of learned leisure, enlivened with free epistolary and personal intercourse with Erasmus, Reuchlin, Pirkheimer, Lasky, and many other scholars of his time. He died at Strasburg, while returning from Baden in Switzerland, whither he had gone for his health, in 1547, leaving behind him a high reputation not only for sound learning but also for singular gentleness, modesty, and simplicity.

His earliest publication was a *Life of Geiler of Strasburg* (1510). Of his subsequent works the principal are *Rerum Germanicarum Libri III.* (1531), and editions of Velleius Paterculus (ed. princeps, from a MS. discovered by himself, 1520); Tacitus (1533, exclusive of the *Histories*); Livy (1535); and Erasmus (with a life, 9 vols. fol., 1540-41).

RHENISH PRUSSIA. See **PRUSSIA, RHENISH**.

RHETICUS, or **RHÆTICUS**, a surname given to **GEORGE JOACHIM** (1514-1576) from his birth at Feldkirch in that part of Tyrol which was anciently the territory of the Rhæti. Born in 1514, he was appointed professor of mathematics at Wittenberg in 1537. His first appearance before the public was in the character of an enthusiastic convert to the newly broached opinions of Copernicus. No sooner had he adopted these opinions than, resigning his chair, he repaired to Frauenberg to sit at the feet of their great promulgator. All his energy was forthwith devoted to the new system, and, as has been mentioned under **COPERNICUS**, it was he who superintended the printing of the *De Orbium Revolutione*. Rheticus now commenced his great treatise, *Opus Palatinum de Triangulis*, and continued to work at it while he occupied his old chair at Wittenberg, while he taught mathematics at Leipsic, while he travelled over different parts of the Continent, and indeed up to his death in Hungary in 1576. The *Opus Palatinum* of Rheticus was published by Otho in 1596. It gives tables of sines and cosines, tangents, &c., for every 10 seconds, calculated to ten places. He had projected a table of the same kind to fifteen places, but did not live to complete it. The sine table, however, was afterwards published on this scale under the name of *Thesaurus Mathematicus* (Frankfort, 1613) by Pitiscus, who himself carried the calculation of a few of the earlier sines to twenty-two places.

RHETORIC. A lost work of Aristotle is quoted by Diogenes Laertius (viii. 57) as saying that Empedocles "invented" (*εὑρεῖν*) rhetoric; Zeno, dialectic. This is certainly not to be understood as meaning that Empedocles composed the first "art" of rhetoric. It is rather to be explained by Aristotle's own remark, cited by Laertius from another lost treatise, that Empedocles was "a master of expression and skilled in the use of metaphor"—qualities which may have found scope in his political oratory, when, after the fall of Thrasydæus in 472 B.C., he opposed the restoration of a tyranny at Agrigentum. The founder of rhetoric as an art was Corax of Syracuse (c. 466 B.C.). In 466 Thrasybulus the despot of Syracuse was

Early
Greek
rhetoric
—Corax.

overtthrown, and a democracy was established. One of the immediate consequences was a mass of litigation on claims to property, urged by democratic exiles who had been dispossessed by Thrasybulus, Hiero, or Gelo. If, twenty years after the Cromwellian settlement of Ireland, an opportunity had been afforded to aggrieved persons for contesting every possession taken under that settlement in the ten counties, such persons being required to plead by their own mouths, the demand for an "art" of forensic rhetoric in Ireland would have been similar to that which existed in Sicily at the moment when Corax appeared. If we would understand the history of Greek rhetoric before Aristotle, we must always remember these circumstances of its origin. The new "art" was primarily intended to help the plain citizen who had to speak before a court of law. "Ten years ago," a Syracusan might urge, "Hieron banished me from Syracuse because I was suspected of popular sympathies, and gave my house on the Epipolæ to his favourite Agathocles, who still enjoys it. I now ask the people to restore it." Claims of this type would be frequent. Such a claim, going many years back, would often require that a complicated series of details should be stated and arranged. It would also, in many instances, lack documentary support, and rely chiefly on inferential reasoning. The facts known as to the "art" of Corax perfectly agree with these conditions. He gave rules for arrangement, dividing the speech into five parts,—proem, narrative, arguments (*ἀγῶνες*), subsidiary remarks (*παρέκβασις*), and peroration. Next he illustrated the topic of general probability (*εἰκός*), showing its two-edged use: e.g., if a puny man is accused of assaulting a stronger, he can say, "Is it likely that I should have attacked him?" If *vice versa*, the strong man can argue, "Is it likely that I should have committed an assault where the presumption was sure to be against me?" This topic of *εἰκός*, in its manifold forms, was in fact the great weapon of the earliest Greek rhetoric. It was further developed by Tisias, the pupil of Corax, as we see from Plato's *Phædrus*, in an "art" of rhetoric which antiquity possessed, but of which we know little else. Aristotle gives the *εἰκός* a place among the topics of the fallacious enthymeme which he enumerates in *Rhet.* ii. 24, remarking that it was the very essence of the treatise of Corax, and points out the fallacy of omitting to distinguish between abstract and particular probability, quoting the verses of Agatho,—“Perhaps one might call this very thing a probability, that many improbable things will happen to men.” Gorgias of Leontini, who visited Athens as an envoy from his fellow-citizens in 427 B.C., captivated the Athenians by his oratory, which, so far as the only considerable fragment warrants a judgment, was characterized by florid antithesis. But he has no definite place in the development of rhetoric as a system. It is doubtful whether he left a written "art"; and his mode of teaching was based on learning prepared passages by heart,—diction (*λέξις*), not invention or arrangement, being his great object.

Gorgias.

Anti-
phon.

The first extant Greek author who combined the theory with the practice of rhetoric is the Athenian Antiphon, the first on the list of the Attic orators. His works belong to the period from 421 to 411 B.C. Among them are the three "tetralogies." Each tetralogy is a group of four speeches, supposed to be spoken in a trial for homicide. Antiphon was the earliest representative at Athens of a new profession created by the new art of rhetoric—that of the *λογογράφος* or writer of forensic speeches for other men to speak in court. The plain man who had not mastered the newly invented weapons of speech was glad to have the aid of an expert. The tetralogies show us the art of rhetoric in its transi-

tion from the technical to the practical stage, from the school to the law-court and the assembly. The four skeleton speeches of each tetralogy are ordered as follows:—A, the accuser states his charge; B, the accused makes his defence; C, the accuser replies; D, the accused rejoins to the reply. The imaginary case is in each instance sketched as slightly as possible; all details are omitted; only the framework for discussion is supplied. The organic lines of the rhetorical pleader's thought stand out in bold relief, and we are enabled to form a clear notion of the logographer's method. We find a striking illustration of the fact noticed above, that the topic of "probability," so largely used by Corax and Tisias, is the staple of this early forensic rhetoric. Viewed generally, the works of Antiphon are of great interest for the history of Attic prose, as marking how far it had then been influenced by a theory of style. The movement of Antiphon's prose has a certain grave dignity, "impressing by its weight and grandeur," as a Greek critic in the Augustan age says, "not charming by its life and flow." Verbal antithesis is used, not in a diffuse or florid way, but with a certain sledge-hammer force, as sometimes in the speeches of Thucydides. The imagery, too, though bold, is not florid. The structure of the periods is still crude; and the general effect of the whole, though often powerful and impressive, is somewhat rigid.

As Antiphon represents what was afterwards named the "austere" or "rugged" style (*αἰσθητὰ ἁρμονία*), so Lysias was the model of an artistic and versatile simplicity. But the tetralogies give Antiphon a place in the history of rhetoric as an art, while Lysias, with all his more attractive gifts, belongs only to the history of oratory. Ancient writers quote an "art" of rhetoric by Isocrates, but its authenticity was questioned. It is certain, however, that Isocrates taught the art as such. He is said to have defined rhetoric "as the science of persuasion" (*ἐπιστήμην πειθοῦς*, Sextus Empir., *Adv. Mathem.*, ii. § 62, p. 301 sq.). Many of his particular precepts, both on arrangement and on diction, are cited, but do not suffice to give us a complete view of his method. The *φιλοσοφία*, or "theory of culture," which Isocrates expounds in his discourses "Against the Sophists" and on the "Antidosis," was in fact rhetoric applied to politics. First came technical expositions: the pupil was introduced to all the artificial resources which prose composition employs (*τὰς ἰδέας ἀπάσας αἷς ὁ λόγος τυγχάνει χρώμενος*, *Antid.*, § 183). The same term (*ἰδέαι*) is also used by Isocrates in a narrower sense, with reference to the "figures" of rhetoric, properly called *σχήματα* (*Panath.*, § 2); sometimes, again, in a sense still more general, to the several branches or styles of literary composition (*Antid.*, § 11). When the technical elements of the subject had been learned, the pupil was required to apply abstract rules in actual composition, and his essay was revised by the master. Isocrates was unquestionably successful in forming speakers and writers. This is proved by the renown of his school during a period of some fifty years, from about 390 to 340 B.C. Among the statesmen whom it could claim were Timotheus, Leodamas of Acharnæ, Lycurgus, and Hyperides. Among the philosophers or rhetoricians were Speusippus, Plato's successor in the Academy, and Iseus; among the historians, Ephorus and Theopompus.

In the person of Isocrates the art of rhetoric is thus thoroughly established, not merely as a technical method, but also as a practical discipline of life. If Plato's mildly ironical reference in the *Euthydemus* to a critic "on the borderland between philosophy and statesmanship" was meant, as is probable, for Isocrates, at least there was a wide difference between the measure of acceptance.

accorded to the earlier Sophists, such as Protagoras, and the influence which the school of Isocrates exerted through the men whom it had trained. Rhetoric had won its place in education. It kept that place, through varying fortunes, to the fall of the Roman empire, and resumed it, for a while, at the revival of learning.

Aristotle's
Rhetoric.

Aristotle's *Rhetoric* belongs to the generation after Isocrates, having been composed between 330 and 322 B.C. As controversial allusions sometimes hint, it holds Isocrates for one of the foremost exponents of the subject. From a merely literary point of view, Aristotle's *Rhetoric* (with the partial exception of book iii.) is one of the driest works in the world. From the historical or scientific point of view, it is one of the most curious and the most interesting. If we would seize the true significance of the treatise, it is better to compare rhetoric with grammar than with its obvious analogue, logic. A method of grammar was the conception of the Alexandrian age, which had lying before it the standard masterpieces of Greek literature, and deduced the "rules" of grammar from the actual practice of the best writers. Aristotle, in the latter years of the 4th century B.C., held the same position relatively to the monuments of Greek oratory which the Alexandrian methodizers of grammar held relatively to Greek literature at large. Abundant materials lay before him, illustrating, in the greatest variety of forms, how speakers *had* been able to persuade the reason or to move the feelings. From this mass of material, said Aristotle, let us try to generalize. Let us deduce rules, by applying which a speaker shall always be able to persuade the reason or to move the feelings. And, when we have got our rules, let us digest them into an intelligent method, and so construct a true art. Aristotle's practical purpose was undoubtedly real. If we are to make persuasive speakers, he believed, this is the only sound way to set about it. But, for us moderns, the enduring interest of his *Rhetoric* is mainly retrospective. It attracts us as a feat in analysis by an acute mind—a feat highly characteristic of that mind itself, and at the same time strikingly illustrative of the field over which the materials have been gathered.

Analysis.
Book I.

Rhetoric is properly an art. This is the proposition from which Aristotle sets out. It is so because, when a speaker persuades, it is possible to find out why he succeeds in doing so. Rhetoric is, in fact, the popular branch of logic. Now hitherto, Aristotle says, the essence of rhetoric has been neglected for the accidents. Writers on rhetoric have hitherto concerned themselves mainly with "the exciting of prejudice, of pity, of anger, and such-like emotions of the soul." All this is very well, but "it has nothing to do with the matter in hand; it has regard to the judge." The true aim should be to *prove* your point, or seem to prove it.

Here we may venture to interpolate a comment which has a general bearing on Aristotle's *Rhetoric*. It is quite true that, if we start from the conception of rhetoric as a branch of logic, the phantom of logic in rhetoric claims precedence over appeals to passion. But Aristotle does not sufficiently regard the question—What, as a matter of experience, is most persuasive? The phantom of logic may be more persuasive to the more select hearers of rhetoric; but rhetoric is not for the more select; it is for the many, and with the many appeals to passion will sometimes, perhaps usually, be more effective than the semblance of the syllogism. And here we seem to touch the basis of the whole practical vice—it was not strictly a theoretical vice—in the old world's view of rhetoric, which, after Aristotle's day, was ultimately Aristotelian. No formulation of rhetoric can correspond with fact which does not leave it absolutely to the genius of the speaker whether reasoning (or its phantom) is to be what Aristotle calls it, the "body of proof" (*σῶμα πείξεως*), or whether the stress of persuading effort should not be rather addressed to the emotions of the hearers. This is a matter of tact, of instinct, of oratorical genius.

But we can entirely agree with Aristotle in his next remark, which is historical in its nature. The deliberative branch of rhetoric had hitherto been postponed, he observes, to the forensic. We have already seen the primary cause of this, namely, that the very origin of rhetoric in Hellas was forensic. The most

urgent need which the citizen felt for this art was not when he had to discuss the interests of the city, but when he had to defend (perhaps) his own property or his own life. The relative subordination of deliberative rhetoric, however unscientific, had thus been human. Aristotle's next statement, that the master of logic will be the master of rhetoric, is a truism if we concede the essential primacy of the logical element in rhetoric. Otherwise it is a paradox; and it is not in accord with experience, which teaches that speakers incapable of showing even the ghost of an argument have sometimes been the most completely successful in carrying great audiences along with them. Aristotle never assumes that the hearers of his rhetorician are as *οἱ χαλεπότες*, the cultivated few; on the other hand, he is apt to assume tacitly—and here his individual bent comes out—that these hearers are not the great surging crowd, the *ὄχλος*, but a body of persons with a decided, though imperfectly developed, preference for sound logic.

What is the use of an art of rhetoric? It is fourfold, Aristotle replies. Rhetoric is useful, first of all, because truth and justice are naturally stronger than their opposites. When awards are not duly given, truth and justice must have been worsted by their own fault. This is worth correcting. Rhetoric is then (1) *corrective*. Next, it is (2) *instructive*, as a popular vehicle of persuasion for persons who could not be reached by the severer methods of strict logic. Then it is (3) *suggestive*. Logic and rhetoric are the two impartial arts; that is to say, it is a matter of indifference to them, as arts, whether the conclusion which they draw in any given case is affirmative or negative. Suppose that I am going to plead a cause, and have a sincere conviction that I am on the right side. The art of rhetoric will suggest to me what might be urged on the other side; and this will give me a stronger grasp of the whole situation. Lastly, rhetoric is (4) *defensive*. Mental effort is more distinctive of man than bodily effort; and "it would be absurd that, while incapacity for physical self-defence is a reproach, incapacity for mental defence should be no reproach." Rhetoric, then, is corrective, instructive, suggestive, defensive. But what if it be urged that this art may be abused? The objection, Aristotle answers, applies to all good things, except virtue, and especially to the most useful things. Men may abuse strength, health, wealth, generalship.

The function of the medical art is not necessarily to cure, but to make such progress towards a cure as each case may admit. Similarly it would be inaccurate to say that the function of rhetoric was to persuade. Rather must rhetoric be defined as "the faculty of discerning in every case the available means of persuasion." Suppose that among these means of persuasion is some process of reasoning which the rhetorician himself knows to be unsound. That belongs to the province of rhetoric all the same. In relation to logic, a man is called a "sophist" with regard to his moral purpose (*προαίρεσις*), i.e., if he knowingly uses a fallacious syllogism. But rhetoric takes no account of the moral purpose. It takes account simply of the faculty (*δύναμις*)—the faculty of discovering any means of persuasion.

The "available means of persuasion," universally considered, The may be brought under two classes. (1) First, there are the proofs *πίστεις* external to the art,—not furnished by rhetoric,—the "inartificial classified proofs" (*ἔτεχνοι πίστεις*). Such are the depositions made by witnesses, documents, and the like. (2) Secondly, there are the proofs, i.e., the agents of persuasion, which the art of rhetoric itself provides, the "artificial proofs" (*ἐντεχνοι πίστεις*). These are of three kinds:—(a) logical (*λογικὴ πίστις*)—demonstration, or seeming demonstration, by argument; (b) ethical (*ἠθικὴ πίστις*), when the speaker succeeds in conveying such an impression of his own character as may lead the hearers to put trust in him; (c) emotional (*παθητικὴ πίστις*), when the speaker works persuasively on the feelings of the hearers. It follows that, besides logical skill, the rhetorician should possess the power of analysing character, in order to present himself in the ethical light which will be most effective with his audience. He must also understand the sources of the emotions, and the means of producing them. Hence rhetoric has a double relationship. While in one aspect—the most important to it as an art—it may be regarded as popular logic, in another aspect it is related to ethics. And hence, says Aristotle, political science (*πολιτικὴ*) being a branch of ethical, as the citizen is one aspect of the man, "rhetoric and its professors slip into the garb of political science (*προδιδέται τὸ σχῆμα τὸ τῆς πολιτικῆς*), either through want of education, or from pretentiousness, or from other human causes."

Aristotle now proceeds to analyse the first of the "artificial The proofs," the logical (*λογικὴ πίστις*). Answering to the strict logical syllogism of logic, rhetoric has its popular syllogism, to which proof Aristotle gives the name of "enthymeme" (*ἐνθύμημα*). This term (from the verb *ἐνθυμεῖσθαι*, "to revolve in the mind"), means properly "a consideration" or "reflection." It occurs first in Isocrates, who uses it simply of the "thoughts" or "sentiments" with which a rhetorician embellishes his work (*τοῖς ἐνθυμήμασι περιέντας λόγον τὸν λόγον καταποιεῖναι*, *Or.*, xiii. § 16). Whether the technical sense was or was not known before Aristotle, it is to

The
enthymeme.

him at least that the first extant definition is due. He defines the enthymeme as a species of syllogism, namely, as "a syllogism from probabilities and signs" (ἐξ εἰκότων καὶ σημείων). The "probability" (εἰκός) is a general proposition, expressing that which usually happens, as, "wise men are usually just." The "sign" (σημεῖον) is a particular proposition, as, "Socrates is just." The "sign" may be fallible or infallible. If we say, "wise men are just; for Socrates was wise and just," this is an enthymeme from a fallible "sign," the implied syllogism being "Socrates was wise; Socrates was just (σημεῖον); ∴ all wise men are just"; and here the "sign" is, in Aristotle's phrase, "as a particular to a universal" because from the one case of Socrates we draw an inference about all men. If, again, we say,—"Here is a sign that he is ill—he is feverish"; our enthymeme is using an infallible sign, the syllogism being, "All who are feverish are ill; he is feverish (σημεῖον); ∴ he is ill." Here, again, the "sign" is "as a particular to a universal." When the "sign" is thus infallible, it is properly called *tekmerion* (τεκμήριον), the matter having been demonstrated and concluded (πεπερασμένον)—"for tekmar and peras mean the same thing ('limit') in the old language." Sometimes, again, the fallible sign is "as universal to particular," e.g., "Here is a sign that he has a fever—he breathes quick," the syllogism being, "Feverish men breathe quick; he breathes quick (σημεῖον); ∴ he has a fever," where a particular cause is unsoundly inferred from an effect (the "universal") which might have other causes.

When Aristotle thus describes the enthymeme, or rhetorical syllogism, as dealing with "probabilities" and "signs," he is describing its ordinary or characteristic materials, *qua rhetorical syllogism*. He does not mean to say that rhetoric cannot use syllogisms formed with other material. It would be hardly needful to point this out, were it not that, in spite of his own clear words, his meaning has sometimes been misunderstood. "The premises of rhetorical syllogisms," he says, "seldom belong to the class of necessary facts. The subject matter of judgments and deliberations is usually contingent; for it is about their actions that men debate and take thought; but actions are all contingent, no one of them, so to say, being necessary. And results which are merely usual and contingent must be deduced from premises of the same kind, as necessary results from necessary premises. It follows that the propositions from which enthymemes are taken will be sometimes necessarily true, but more often only contingently true." Among the materials of the enthymeme, the "sign" which is infallible (the σημεῖον which is also a τεκμήριον) is so because it is to some necessary truth as part to whole.

Suppression of one premiss not essential.

Aristotle did not regard the suppression of one premiss in the statement as essential to the enthymeme. The syllogism, of which the enthymeme is merely a kind, was regarded by him "not in relation to the expression" (οὐ πρὸς τὸν ἔξω λόγον), but to the process in the mind (ἀλλὰ πρὸς τὸν ἐν τῇ ψυχῇ λόγον, *Anal. Post.*, i. 10). As Sir W. Hamilton has justly said, he could not then have intended to distinguish a class of syllogisms by a verbal accident. The distinction of the rhetorical syllogism, in Aristotle's view, was in its matter, not in its form. This is, indeed, made sufficiently clear by his own remark that the enthymeme may "often" be more concisely stated than the full, or normal, syllogism (*Rhet.*, i. 2). There is obviously no reason why the rhetorical reasoner should not state both his premisses, if he finds it convenient or effective to do so. Since, however, one of the premisses is often left to be mentally supplied, some of the later writers on rhetoric came to treat this as part of the essence of the enthymeme. It was then that the word *ἀρετής* was interpolated after *συλλογισμός* in Aristotle, *Anal. Prior.*, ii. 27, where the enthymeme is defined as *συλλογισμός ἐξ εἰκότων καὶ σημείων*.¹ Hence Quintilian says of the enthymeme (v. 10), "*alii rhetoricum syllogismum, alii imperfectum syllogismum vocant*"; hence, too, Juvenal's "*curtum enthymema*."

The example.

The other branch of the "logical proof" in rhetoric corresponds to the induction of strict logic, and consists in giving the semblance of inductive reasoning by the use of one or two well-known examples. As Aristotle calls the enthymeme a rhetorical syllogism, so he calls the example (*παράδειγμα*) "a rhetorical induction." Thus if a man has asked for a body-guard, and the speaker wishes to show that the aim is a tyranny, he may quote the "examples" of Dionysius and Pisistratus.

The τόποι,

Aristotle next distinguishes the "universal" from the "special" topics, or commonplaces of rhetoric. The word τόπος, "place," means in this context "that place in which a proposition of a given kind is to be sought." The τόποι, then, are classifications of propositions and arguments which rhetoric makes beforehand, with a view to readiness in debate. Cicero well illustrates the phrase—"As it is easy to find hidden things when the place has been pointed out and marked, so, when we want to track out an argument, we ought to know the places, as Aristotle has called these seats, abodes, as it were, from which arguments are drawn.

So a commonplace, or topic, may be defined as the abode of an argument (*licet definire locum esse argumenti sedem*; Cic., *Topica*, ii. 7). So elsewhere he describes the τόπος of rhetoric as "*regiones intra quas venere et pervestigare quod quaeras*"—"haunts in which one may hunt and track out the object of quest" (*De Orat.*, ii. 34). The "universal commonplaces" (κοινοὶ τόποι) are general heads of argument applicable to all subjects and whatsoever—as, e.g., on the "possibility" or "impossibility" of anything. The special commonplaces (τόποι τῶν εἰδῶν, *Rhet.*, ii. 22, more briefly called εἰδη) are those which are drawn from special branches of knowledge, as from politics, ethics, &c. Here Aristotle observes that the more a rhetorician enters on the subject-matter of any particular science the more will he tend to pass out of the domain which properly belongs to the art of rhetoric.

In that domain three provinces are distinguished. Deliberative rhetoric (συμβουλευτική) is concerned with exhortation or kinds of dissuasion, and with future time; its "end" (τέλος)—that which it keeps in view, or its standard—is advantage (or detriment) to the persons addressed. Forensic rhetoric (δικανική) is concerned with accusation or defence, and with time past; its standard is justice or injustice. Epideictic rhetoric—the ornamental rhetoric of "display" (ἐπιδεικτική)—is concerned with praise or blame, and usually with time present; its standard is honour or shame.

1. Let us begin with deliberative rhetoric, says Aristotle, and see Deliberative what things a deliberative speaker ought to know. The subjects with which, in a public assembly, he will have to deal are mainly these five:—(1) finance, (2) foreign war, (3) home defence, (4) commerce, (5) legislation. Under all these heads, he ought to be provided with some εἰδη, or special commonplaces. Further, all his suasion or dissuasion has reference to the happiness of those whom he addresses. Hence he must be acquainted with the popular notions of happiness which are actually prevalent. Here Aristotle gives a series of popular definitions of happiness, and a list of the elements which are generally regarded as constituting it. A similar analysis of "good" (ἀγαθόν) follows.

The scientific spirit of the rhetoric is strongly accentuated by the unscientific character of these and subsequent analyses. Aristotle never forgets that his rhetorician wants to know, not what a thing is, but what it is generally thought to be. There is nothing of cynicism or sarcasm in all this. He is simply going through his prescribed task. He is making rhetoric, as such, into a method. But suppose the question arises—"Of two good things which is the better?" Our deliberative speaker must be able to treat the "universal commonplace" of degree (μᾶλλον καὶ ἧττον). Then, he must also know something about the chief forms of government,—democracy, oligarchy, aristocracy, monarchy,—not as they are or should be, but as they are popularly conceived.

2. The ornamental rhetoric (ἐπιδεικτική), which is taken next, Epideictic is somewhat briefly dismissed. It might be conjectured, in explanation of its place in the treatment—we should have expected it to come third—that Aristotle was the first writer who recognized it as an independent kind, and that he viewed it as an offshoot from the deliberative branch. The epideictic speaker must know what most men think "honour" or "shame," "virtue" or "vice." At this point a verbal distinction of some interest occurs:—praise (ἔπαινος) implies moral approbation; but an "encomium" (ἐγκώμιον) is given to "achievements" (ἔργα) as such. The most generally useful "topic" for the ornamental speaker is αὐξησις (magnifying),—as the rhetorical induction (παράδειγμα) most helps the deliberative speaker, and the rhetorical syllogism (ἐνθάρμημα) is most useful to the forensic.

3. In forensic rhetoric, we must begin by analysing injustice. Forensic. And first, "What are the motives and aims of wrong-doing?" Actions are either voluntary from habit, reason, anger, lust, or involuntary from chance, nature, force. In reference to the voluntary actions, it is needful to know the popular conception of pleasure. Secondly, "What is the character which disposes a man to do wrong, or which exposes him to suffering it?" These topics must be familiar, in a popular way, to the forensic speaker. He must also know the general grounds on which actions are classed as just or unjust. Actions must be considered, first, in reference to law, which is either special (ἰδιος), whether written or unwritten, the law of particular places and communities, or else universal (κοινός), the law of nature. The second question about an "unjust" action is whether it hurts an individual or the community. The definition of "being wronged" (ἀδικεῖσθαι) is, "to be unjustly treated by a voluntary agent." Further, the definition of a particular offence (ἐπίγραμμα) sometimes raises a legal issue. A man may admit an act, and deny that it corresponds to the description given of it by the accuser. It is needful, then, to know the definitions of the principal crimes. It may be noticed that Aristotle here anticipates a topic which played a large part in the later rhetoric. The contested issues which he calls ἀμφισβητήσεις (The *Rhet.*, iii. 16) were the στάσεις (constitutions or status) of later "issues." days. Thus the issue as to the proper definition of an offence, to which he refers here (*Rhet.*, i. 13), coincides with the later

¹ On this interpolation, see Sir W. Hamilton's *Discussions*, p. 154.

στάσεις δικη. The distinction between justice and equity (τὸ δίκαιον and τὸ ἐπιεικές) is noticed. Equity is "a kind of justice, but goes beyond the written law," as in the *Ethics* (v. 10) equity is said to be a corrective of the law, where the latter fails through generality,—i.e., through the lawmaker's inability to frame a general rule which should precisely fit the circumstances of every particular case. True to his conception of a method, Aristotle next applies "the topic of degree" to injustice,—as, in an earlier chapter (*Rhet.*, i. 7) he had applied it to the idea of "good."

The analysis of the three branches of rhetoric—deliberative, epideictic, forensic—is now finished. In the closing chapter of his first book, Aristotle briefly considers and dismisses the "artificial proofs,"—the means of persuasion, that is, which arise from matters external to the art itself, though the art uses them. These, having regard to the actual circumstances of his time and country, he declares to be five: (1) laws; (2) witnesses; (3) evidence given under torture—βάσανος; (4) documents; (5) oaths, meaning chiefly treaties between states. With regard to (3) it may be remarked that the rhetorical theory of torture in the ancient world was, that a person under torture will tell the truth because it is his interest to do so. This is stated, e.g., in the *Rhetorica ad Alexandrum*, xv. § 1. Among the Attic orators, Isæus gives his emphatic adhesion to this view (*Or.*, viii. § 12). On the other hand, the common-sense view of the matter is very well put by another Attic orator, Antiphon, in his speech *De Cæde Herodis* (§§ 31–33), when he remarks that "in the torturers is the hope of the tortured." "So long, then," Antiphon proceeds, "as the slave felt that his prospects in slandering were hopeful, he was obstinate in the calumny; but, when he saw that he was to die, then at last he told the truth, and said that he had been persuaded by the persecutors to slander me." It would have been interesting if Aristotle had given some indication of his view on this, his third, *ἔτεχνος πίστις*; but he simply accepts it as a fact of his day, and, taking it along with the rest, gives a number of general arguments which may be used on either side, according as the particular *ἔτεχνος πίστις* is for us or against us. Here the first book ends.

Book II. At the beginning of the second book, Aristotle returns to the "artificial proofs" (*ἔτεχνος πίστις*)—those which rhetoric itself provides. Of these, the logical proof has already been in part discussed (i. 2). He therefore turns to the "ethical" proof. The speaker's character may be so indicated by his speech as to prepossess the hearers; and this result depends chiefly on three things. He should make them feel that he possesses (1) φρόνησις—intelligence; (2) ἀρετή—virtue; and (3) εὖνοια—good-will to them. Aristotle then proceeds to furnish the speaker with the materials for seeming intelligent and good, referring for these to his previous analysis of the virtues (i. 9). As to the means of seeming friendly, these will be furnished by an analysis of the affections (πάθη). Here we are already on the boundary line between the "ethical proof" and the third of the *ἔτεχνος πίστις*, the "emotional proof." In regard to each affection (πάθος), we have to see (1) what it is; (2) what things predispose men to it; (3) the objects and conditions of its manifestation. The next ten chapters of the second book (2–11) are accordingly devoted to an analysis of those emotions which it is most important for the rhetorician to understand:—viz. (1) anger, and its opposite, mildness; (2) love and hatred; (3) fear and boldness; (4) compassion, envy, emulation; (5) shame and shamelessness; (6) gratitude (χάρις); (7) righteous indignation (νέμεσις). But, in appealing to these various emotions, the speaker must have regard to the general character of his audience, according, e.g., as they are young or old, rich or poor, &c. Hence it is necessary to know the characteristics of the various periods and conditions of life. Aristotle therefore delineates the chief traits of the young, of the old, and of men in their prime; of the well-born, the rich, and the powerful. With regard to the well-born, he makes a remark which seems equally true of the rich: "the possessor of good birth is the more ambitious; for all men, when they have got anything, are wont to add to the heap" (ch. 12–17). The analysis of the "ethical" and the "emotional" proof is now finished.

After a concise retrospect, Aristotle passes to the treatment of a subject barely indicated in the first book (ch. 2). The κοινὰ τόποι, or "universal commonplaces," applicable to all materials, are mainly four:—(1) τὸ δυνατόν and τὸ ἀδύνατον—possibility and impossibility; (2) τὸ γεγονός and τὸ μέλλον—past and future; (3) τὸ ἀξίον καὶ μειῶν (or μέγεθος and μικρότης)—great and small; (4) τὸ μᾶλλον καὶ ἧττον—greater and less. Aristotle means that all subjects whatsoever admit of arguments into which these ideas enter. The first comes into play when we argue, "since this is possible, that must be so also"; the second, when we say, "if this has been, that has been also," or "if this is to happen, that will happen also." For the third and fourth of the κοινὰ τόποι, magnitude and degree, we are referred back to bk. i. ch. 7 and 8, where they have already been handled. The second book is completed by a sort of appendix, intended to supplement the sketch of

the "logical proof" given in bk. i. ch. 2. The "example," or "The rhetorical induction, had been rather cursorily treated there, and ample" is now illustrated more fully (ii. 20). There are two kinds of con—"example"—the historical (τὸ πρᾶγμα λαβεῖν) and the artificial (τὸ αὐτὸν ποιεῖν). The artificial example, again, has two species—(1) comparison, παραβολή,—as when Socrates said that magistrates ought not to be chosen by lot, for this is like choosing athletes by lot, rather than for athletic power; (2) fiction, or fable in the special sense—λόγοι; as when Stesichorus warned the people of Himera against establishing a despot by telling them the fable of the horse who asked the man to help him against a deer. If you have no arguments of a logical kind (enthymemes), says Aristotle, the "example" must do duty as proof; if you have enthymemes, it can serve as illustration.

The use of γνῶμαι, or general moral sentiments, next claims the use attention (ch. 21). These are of two classes—those which are self-evident, and those which, not being so obviously true, require some confirmatory comment (ἐπιλόγος), as when Medea says that no sensible man should allow his children to be exquisitely educated, because it makes them fastidious and unpopular. Such maxims with an "epilogue" are, in fact, virtually enthymemes. Apropos of γνῶμαι, Aristotle remarks that spurious generalization is particularly useful in the utterance of bitter complaint (e.g., "frailty, thy name is woman"). Then it is often effective to controvert received maxims, e.g., "It is not well to 'know oneself'; for if this man had known himself, he would never have become a general" (ch. 21).

Some precepts on the enthymeme follow. The rhetorical reasoner must not have too many links in the chain of his argument; and use of he must omit those propositions which his hearers can easily supply. Also, it is highly important to know the special topics (εἰδη) from which enthymemes can be drawn in each subject. The enthymeme is either (1) δεικτικόν, demonstrative, establishing a point, or (2) ἐλεγκτικόν, refutative, destroying a position by a comparison of conflicting statements (τὸ τὰ ἀνομολογούμενα συνάγειν). Aristotle now gives (ii. 23) an enumeration of classes or heads of argument (ἐνθυμηματικοὶ τόποι) from which enthymemes can be constructed. These apply nominally to all three branches of rhetoric, but in fact chiefly to the deliberative and the forensic. The demonstrative enthymeme is almost exclusively treated, since the refutative form can, of course, be inferred from the other. A chapter (24), answering to the treatise on fallacies in logic (περὶ σοφιστικῶν ἐλέγχων), is devoted to the fallacious (φαινόμενον) enthymeme, of which ten "topics" are explained and illustrated. Another chapter is given to the two general types of λύσις, or refutation (ch. 25), viz., (1) direct counter-argument (τὸ ἀντισυλλογίζεσθαι), opposing one enthymeme to another; (2) objection to a particular point in the adversary's case (τὸ ἐνίστασθαι). The second book then concludes with some supplementary remarks, meant, seemingly, to correct errors made by previous writers on rhetoric (ch. 26).

In his first two books Aristotle has thus dealt with invention (Book III. εὕρεσις)—the discovery of means of persuasion. In the third book he deals with expression and arrangement (λέξις and τάξις). The subject is prepared by some remarks on the art of delivery (διδασκαλία), which Aristotle defines as the management of the voice. "It is the art of knowing how to use the voice for the expression of each feeling, of knowing when it should be loud, low, or moderate, of managing its pitch—shrill, deep, or middle—and of adapting the cadences to the theme." Aristotle says nothing on gesture or play of feature, which Cicero and Quintilian recognize as important. He includes them by implication, however, in saying that the art of delivery, whenever it is reduced to method, "will perform the function of the actor's art," adding that "the dramatic faculty is less a matter of art than of nature."

But verbal expression, at least, is clearly in the province of art, and to that he now turns. He deals first with diction (λέξις) in Diction. the proper sense, as concerned with the choice of words and phrases. The first excellence of diction is clearness (σαφηνεία), which is attained by using words in their proper sense (κύρια). Next, the diction must be "neither too low nor too grand, but suitable to the subject." In prose (ἐν τοῖς ψιλοῖς λόγοις) there is less scope for ornament than in poetry, though in the latter, too, much depends on the speaker or the theme. And here Aristotle remarks that Euripides was the first poet who produced a happy illusion by taking his words from the language of daily life (ἐκ τῆς εἰσθύλης διαλέκτου). With a view to adorning prose, and giving it "distinction" (the term which best represents Aristotle's phrase ξένον or ξενικὸν ποιεῖν), nothing is more important than the judicious use of metaphor. Aristotle admits that "the art of metaphor cannot be taught"; but he gives some sensible hints on the subject, and on the use of epithets. The poet Simonides, he tells us, when the winner of a mule race offered him a small fee, declined to write an ode on "half-asses," but, when the price was raised, sang "Hail, daughters of windswift steeds." The perceptions which made the best Greek prose so good are illustrated by Aristotle's next chapter (iii. 3) on ψυχρά, "frigidity," "faults of style." He traces these to four

chief sources,—the use of tawdry or ungainly compounds (*δυνατά*), the use of rare or obsolete words (*γλωτταί*), and infelicity of epithet or metaphor.

A simile (*εἰκὼν*) is a metaphor with an explanation (*λόγος*): e.g., in speaking of Achilles, "he sprang on them like a lion" is simile; "the lion sprang on them" is metaphor. Simile is less available than metaphor for prose, being more poetical. The "proportional" metaphor mentioned here requires a passing comment. Aristotle used the term "metaphor" (*μεταφορά*) in a larger sense than ours. He meant by it "any transference of a word to a sense different from its proper sense." Thus he can distinguish (*Poet.*, c. 21) four classes of metaphor:—(1) "from genus to species," as when "vessel" means "ship"; (2) from species to genus, as when "the lilies of the field" stand for "flowers" generally. These two kinds are not what we call "metaphors," but are examples of the figure which was afterwards named "synecdoche." Aristotle's third class of metaphor is (3) "from species to species," under which head come almost all familiar metaphors, as to "scent a plot,"—the generic notion, "find out," being common to the special terms, "scent" and "detect"; (4) then lastly there is the "proportional" metaphor (*ἡ ἀνάλογον*), when A is not simply compared with B (on the strength of something obviously common to both), but A's relation to C is compared with B's relation to D. To call old age "the evening of life" implies that old age is to life as the evening to the day. Obviously a "proportion" of this kind is implicit in the metaphors of Aristotle's third class; but in the fourth class proportion is expressly indicated by the mention of the second term ("life" in our example).

The first four chapters having thus dealt with expression in the narrower sense of diction (*λέξις* proper), Aristotle devotes the next eight (iii. 5-12) to composition, which would be properly called *σύνθεσις*. After remarks on the first requisites—grammatical correctness, and purity of idiom (*τὸ ἑλληνίζειν*)—we have some hints on "dignity" of style (*δῆκος*). "Propriety" (*τὸ πρέπον*) is defined as depending chiefly on three qualities:—(1) expression of the feelings which it is desired to move in the hearer; (2) fitness to the character and position of the speaker; and (3) congruity with the level of the subject. A certain "rhythm" (*ῥυθμός*), or harmonious movement, should be sought in prose; but this must not be so precise as to give the effect of metre. The elements of rhythm are "times," i.e., in writing, long or short syllables, the short syllable being the unit. Here, following the early writers on music (comp. Plato, *Rep.*, 400 B), Aristotle recognizes three "rhythms": (1) the "heroic" or dactylic, — — —, which is in the ratio of equality, since — = — —, or 1:1; (2) the iambic or trochaic (— — or — —), which has the ratio of 2 to 1; (3) the pæonic, — — — —, which has the ratio of 3:2. Of these, the heroic is too grand for prose; the iambic is too commonplace, being the very cadence of ordinary talk (*αὐτὴ ἔστιν ἡ λέξις τῶν πολλῶν*); the trochee is too comic. The pæon remains. It is the best rhythm for prose, since it will not, by itself, produce a metrical effect (*μᾶλλον λαμβάνει*). The "first" pæon (— — — —) is most suitable to the beginning of sentences, the "fourth" pæon (— — — —) to the close. Rhythm having been attained, a framework is supplied by the period (*περίοδος*). A "compact" or periodic style (*κατεστραμμένη λέξις*) is so called in contrast with that "running" style (*εἰρομένη λέξις*) which simply strings clause to clause, "having no necessary end until the thought is finished," and is displeasing because it is unlimited; "for all men wish to desecry the end." The periodic style pleases for the opposite reason, because the nearer always fancies that he has grasped something and has got something defined. The period may consist of several parts or members (*κῶλα*), or it may be "simple," forming a unit (*ἀφελές, μονόκωλον*). The rhetorical use of antithesis is then noticed in its application to the period. Two kindred figures are also mentioned,—*parisosis*, a parallelism of structure between clauses of equal length,—and *paromoiosis*, a resemblance in sound, when the last (or first) word of one clause has an echo, as it were, in the same place of the next clause.

Two chapters (10, 11) are now given to the sources of vivacity in speaking. Those "smart sayings" (*τὰ ἀστεία*) which win applause "must be invented by the clever or practised man; the business of this treatise is to point out their use." They come chiefly from (1) metaphor, (2) antithesis, and (3) vividness—i.e., placing the thing described "before the eyes of the hearer" (*τὸ πρὸ ὁμμάτων ποιεῖν*). This is called by Aristotle *ἐνέργεια*, "actuality" (which must be carefully distinguished from *ἐνέργεια*, another term for "vividness"), since things are represented not merely in their potentiality (*δύναμις*), but as living and moving. One of the most effective kinds of point (says Aristotle) is "a metaphor with a surprise," i.e., with the disclosure of a likeness not perceived before, the source of the pleasure being the same as in riddles.

The whole subject of expression is concluded by a chapter on the general types of style, in their relation to the three branches of rhetoric (ch. 12). There is a literary style (*γραφικὴ λέξις*) and a style suited to oral contest or debate (*ἀγωνιστική*). The literary style is that which admits of the highest finish (*ἀκριβεστάτη*), and

is best suited to the epideictic branch of rhetoric, since the latter is properly addressed to readers. The other, or "agonistic," style is best adapted to delivery (*δποκριτικωτάτη*). It is so mainly through two things—adaptation to the character of speaker and hearer, and skilful appeals to feeling. Forensic and deliberative rhetoric both use it; but the forensic branch admits of higher finish, and so far approximates to the literary style. Deliberative rhetoric, on the other hand, is like drawing in light and shade (without colours), *σκιαγραφία*—like scene-painting, we should rather say, i.e., it is meant to produce its effects at a distance, and will not bear looking at too closely.

From expression we now pass to the other subject announced at the opening of the third book, arrangement (*τάξις*), which occupies the last seven chapters (13-19). The received system, which had been popularized, if not originated, by Isocrates, recognised four divisions of a speech: (1) exordium (or proem), *προοίμιον*; (2) narrative, *διήγησις*; (3) proof, *πίστεις*; (4) peroration, *ἐπίλογος*. Aristotle adopts this fourfold partition as his basis,—with the preliminary remark, however, that only two elements are necessarily present in every case, viz., "statement" of one's subject, *πρόθεσις*, and "argument" in its support, *πίστεις*. He then takes the four divisions in order. The contents of the proem usually come under one of two heads—(1) exciting or allaying prejudice; (2) amplifying or detracting. In epideictic rhetoric the connexion of proem with sequel may be comparatively loose; it is like a flute-player's prelude (*προαύλιον*), which he deftly links on to the keynote (*ἐνδόσμιον*) of his principal theme. The forensic proem, on the other hand, may be likened to the prologue of an epic or a tragedy (ch. 14, 15). Narrative is least needed in deliberative speaking, since this deals chiefly with the future. In forensic narrative, the object must be to bring out clearly the issues on which accuser or accused relies, with an effective colouring of ethos and pathos. In the epideictic branch, the narrative should not form a continuous whole, but should be divided and varied by comments (ch. 16). The rhetorician's proofs (*πίστεις*) will, in the forensic branch, be relevant to one of four issues:—(1) fact: was the alleged act done, or not? (2) damage: if done, was it hurtful? (3) criminality: if hurtful, was the hurt justifiable? (4) quantity or degree. Aristotle's four "issues" (*ἀμφισβητήσεις*) here correspond with the *στάσεις*, "positions" or "questions," usually three, of later logicians and rhetoricians: (1) *στάσις στοχαστική*, *status conjecturalis*, the question of fact; (2) *στάσις δριχί*, *status definitivus*, *nomen*, or *finis*, the question of legal definition; (3) *στάσις ποιότητος*, *status qualitatius* or *juridicialis*, the question of justice or injustice. Thus Cicero says, "res (controversiam facit) aut de vero (1), aut de recto (3), aut de nomine (2), *Orat.*, xxxiv. 121. In deliberative rhetoric, the four "issues" can be applied to the future, since, if a speaker anticipates certain results from a course of a policy, his adversary can deny their (1) probability, (2) expediency, (3) justice, or (4) importance. The enthymeme is most useful in the deliberative branch, as the "example," or rhetorical induction, is most useful in the forensic. The "ethical" proof from the speaker's indicated character is always a most important adjunct to the logical proof (ch. 17). A chapter is now given to one special resource by which a proof can often be enforced, viz., interrogation of the adversary (*ἐρώτησις*), which has usually one of two objects—(1) *reductio ad absurdum*, or (2) to entrap him into a fatal admission (ch. 18). The last chapter of the book, and of the treatise, 4. Epideictic deals with the peroration or "epilogue" (*ἐπίλογος*). This aims logue, usually at one of four things:—(1) to conciliate the hearers; (2) to magnify or lower the importance of topics already treated; (3) to excite emotion in the hearers; (4) to refresh their memories by a short recapitulation. Remarkably that asyndeton gives force to the close of an epilogue, Aristotle ends his rhetoric with the last words (not quite accurately quoted) of the great speech in which Lysias denounced Eratosthenes—*παύσομαι κατηγορῶν. ἀκηκάτε, εὐράκατε, πεπόνθατε, ἔχετε, δικάζετε*.

Aristotle's *Rhetoric* is incomparably the most scientific work which exists on the subject. It may also be regarded as having determined the main lines on which the subject was treated by nearly all subsequent writers. The extant treatise on rhetoric entitled *Ῥητορικὴ πρὸς Ἀλέξανδρον* was undoubtedly by Anaximenes of Lampsacus, and was probably composed about 340-330 B.C., a few years before Aristotle's work. The introductory letter prefixed to it is a late forgery. If the treatise of Anaximenes is compared with that of Aristotle the distinctive place of the latter in this field becomes clearer. Anaximenes, who knew the treatise of Isocrates, and could profit by all the preceding Greek "arts," is, for us, the sole representative of technical rhetoric before Aristotle, and probably represents it at its best. We miss the intellectual power, the grasp of principles, and the subtle discrimination which belong to

the work of Aristotle. On the other hand, the practical character is more strongly marked. It might, indeed, be said of Aristotle's treatise that it is rather a Philosophy of Rhetoric than a Rhetoric proper. It is a body of abstract principles and general rules. These will enable the student to dissect a good speech; but, by themselves, they will not go far towards enabling him to make one. Aristotle's purpose was to annex rhetoric to the realm of science. He succeeded, as far as success was possible. But the new province was somewhat of a Poland. The rigid system which was found necessary for holding the unruly dependency did not leave much scope for spontaneous vigour or native exuberance.

During the three centuries from the age of Alexander to that of Augustus the fortunes of rhetoric were governed by the new conditions of Hellenism. Aristotle's scientific method lived on in the Peripatetic school. Meanwhile, however, the fashion of florid declamation or strained conceits prevailed in the rhetorical schools of Asia, where, amid mixed populations, the pure traditions of the best Greek taste had been dissociated from the use of the Greek language. The "Asianism" of style which thus came to be contrasted with "Atticism" found imitators at Rome, among whom must be reckoned the orator Hortensius (c. 95 B.C.). Hermagoras of Temnos in Æolis (c. 110 B.C.) claims mention as having done much to revive a higher conception. Using both the practical rhetoric of the time before Aristotle and Aristotle's philosophical rhetoric, he worked up the results of both in a new system,—following the philosophers so far as to give the chief prominence to "invention." He thus became the founder of a rhetoric which, as distinguished from the practical and the philosophical, may be called the scholastic. Through the influence of his school, Hermagoras did for Roman eloquence very much what the school of Isocrates had done for Athens. Above all, he counteracted the view of "Asianism," that oratory is a mere knack founded on practice, and recalled attention to the study of it as an art.¹

Cicero's rhetorical works are to some extent based on the technical system to which he had been introduced by Molon at Rhodes, and by other contemporary teachers. But Cicero further made an independent use of the best among the earlier Greek writers, as Isocrates, Aristotle, and Theophrastus. Lastly, he could draw, at least in the later of his treatises, on a vast fund of reflection and experience. Indeed, the distinctive interest of his contributions to the theory of rhetoric consists in the fact that his theory can be compared with his practice. The result of such a comparison is certainly to suggest how much less he owed to his art than to his genius. Some consciousness of this is perhaps implied in the idea which pervades much of his writing on oratory, that the perfect orator is the perfect man. The same thought is present to Quintilian, in whose great work, *De Institutione Oratoria*, the scholastic rhetoric receives its most complete expression (c. 90 A.D.). Quintilian treats oratory as the end to which the entire mental and moral development of the student is to be directed. Thus he devotes his first book to an early discipline which should precede the orator's first studies, and his last book to a discipline of the whole man which lies beyond them. Some notion of his comprehensive method may be derived from the circumstance that, in connexion with precepts for storing the speaker's mind, he introduces a succinct estimate of the chief Greek and Roman authors, of every kind, from Homer to Seneca (bk. x. §§ 46–131). After Quintilian, the next name which deserves to be signalized in the history of the art is that of Hermogenes, who about 170 A.D.

made a complete digest of the scholastic rhetoric from the time of Hermagoras of Temnos (110 B.C.). It is contained in five extant treatises, which are remarkable for clearness and acuteness, and still more remarkable as having been completed before the age of twenty-five. Hermogenes continued for nearly a century and a half to be one of the chief authorities in the schools. Longinus (c. 260 A.D.) published an *Art of Rhetoric* which is still extant; and the more celebrated treatise *On Sublimity* (*περὶ ὑψους*), if not his work, is at least of the same period. About 315 A.D. Aphthonius composed the "exercises" (*πρὸς ὑμνάσματα*) which superseded the work of Hermogenes. At the revival of letters the treatise of Aphthonius once more became a standard text-book. Much popularity was enjoyed also by the exercises of Ælius Theon (380 A.D.). Space would fail if we attempted to enumerate the writers on rhetoric who, during these centuries, attained to more or less repute. In the editions of the *Rhetores Græci* by Spengel and by Walz the fecundity of the literature can be seen.

The theory of rhetoric engaged this industry, because the practice of the art was in greater vogue than ever before or since. During the first four centuries of the empire several causes contributed to this result. First, there was a general dearth of the higher intellectual interests; politics gave no scope to energy; philosophy was stagnant, and literature, as a rule, either arid or frivolous. Then the Greek schools had poured their rhetoricians into Rome, where the same tastes which revelled in coarse luxury welcomed tawdry declamation. The law-courts of the Roman provinces further created a continual demand for forensic speaking. Asia, Gaul, and Africa are now the regions which supply the largest proportion of successful orators. The passion for rhetoric was everywhere. "Thule talks of engaging an orator," says Juvenal. "You call a man a thief," says Persius; "he answers you with finished tropes." Athens, Smyrna, Rhodes, Tarsus, Antioch, Alexandria, Massilia, and many other cities had seats of learning at which rhetoric was taught by professors who enjoyed the highest consideration. The public teacher of rhetoric was called "sophist," which was now an academic title, similar to "professor" or "doctor." In the 4th century B.C. Isocrates had taken pride in the name of *σοφιστής*, which, indeed, had at no time wholly lost the good, or neutral, sense which originally belonged to it. The academic meaning which it acquired under the early empire lasted into the Middle Ages (see Ducange, s.v., who quotes from Baldricus, "Egregius Doctor magnusque Sophista Geraldus"). While the word *rhetor* still denoted the faculty, the word *sophistes* denoted the office or rank to which the rhetor might hope to rise. So in Lucian's piece (160 A.D.), the "Teacher of Rhetoricians" says (§ 1),—"You ask, young man, how you are to become a rhetor, and attain in your turn to the repute of that most impressive and illustrious title, sophist."

Vespasian (70–79 A.D.), according to Suetonius, was the first emperor who gave a public endowment to the teaching of rhetoric. But it was under Hadrian and the Antonines (117–180 A.D.) that the public chairs of rhetoric were raised to an importance which made them objects of the highest ambition. The complete constitution of the schools at Athens was due to Marcus Aurelius. The Philosophical School had four chairs (*θρόνοι*),—Platonic, Stoic, Peripatetic, Epicurean. The Rhetorical School had two chairs, one for "sophistic," the other for "political" rhetoric. By "sophistic" was meant the academic teaching of rhetoric as an art, in distinction from its "political" application to the law-courts. The "sophistical" chair was superior to the "political" in dignity as in

¹ See Professor Jebb's *Attic Orators*, vol. ii. p. 445.

emolument, and its occupant was invested with a jurisdiction over the youth of Athens similar to that of the vice-chancellor in a modern university. Thus it is said of Theodotus, the first holder of the chair of sophistic as constituted by Marcus Aurelius, *προέστη δὲ καὶ τῆς τῶν Ἀθηναίων νεότητος πρώτος* (Philostr., *Vit. Soph.*, II. ii. p. 566). The Antonines further encouraged rhetoric by granting immunities to its teachers. Three "sophists" in each of the smaller towns, and five in the larger, were exempted from taxation (*Dig.*, xxvii. 1, 6, § 2). The wealthier sophists affected much personal splendour. One of them, Polemon (c. 130 A.D.), was attended on his journeys by an enormous retinue—slaves, beasts of burden, horses, and hounds—while he himself drove in a costly equipage. Another, Adrian of Tyre (c. 170 A.D.), was drawn to his lectures by horses "with silver bits," wore the richest attire and the rarest jewels, and endeared himself to the Athenian students by the entertainments which he provided for them. In all this foppery there was calculation. The aim of the sophist was to impress the multitude. Popular applause was the breath of life to him. His whole stock in trade was style, and this was directed to astonishing by *tours de force*. The scholastic declamations were chiefly of two classes. (1) The *suasoriae* were usually on historical or legendary subjects, in which some course of action was commended or censured; thus Juvenal, alluding to his school-days, cries—

Declama-
tions.

"I, too, have counselled Sulla to resign,
And taste those joys for which dictators pine."

These *suasoriae* belonged to deliberative rhetoric (the *βουλευτικὸν γένος*, *deliberativum genus*). (2) The *controversiae* turned especially on legal issues, and represented the forensic rhetoric (*δικανικὸν γένος*, *judiciale genus*). But it was the general characteristic of this period that all subjects, though formally "deliberative" or "forensic," were treated in the style and spirit of that third branch which Aristotle distinguished, the rhetoric of *ἐπίδειξις* or "display." The oratory produced by the age of the academic sophists can be estimated from a large extant literature. It is shown under various aspects, and presumably at its best, by such writers as Dion Chrysostom at the end of the 1st century, Aelius Aristides in the 2d, Themistius, Himerius, and Libanius in the 4th. It would be unjust to deny that, amid much which is tawdry or vapid, these writings occasionally present passages of true literary beauty, while they constantly offer matter of the highest interest to the student of the past.

Mediaeval
study of
rhetoric.

In the mediæval system of academic studies, grammar, logic, and rhetoric were the subjects of the trivium, or course followed during the four years of undergraduateship. Music, arithmetic, geometry, and astronomy constituted the quadrivium, or course for the three years from the B.A. to the M.A. degree. These were the seven liberal arts. According to Hallam (*Lit. Eur.*, vol. i.), the idea of a trivium and quadrivium dates from the 6th century. The well-known memorial couplet can be traced to c. 1420 A.D. :—

Gram. loquitur, *Dia.* vera docet, *Rhet.* verba colorat :
Mus. canit, *Ar.* numerat. *Geo.* ponderat, *As.* colit astra.

A shorter formula was—"lingua, tropus, ratio; numerus, tonus, angulus, astra." In the Middle Ages the chief authorities on rhetoric were the latest Latin epitomists, such as Martianus Capella (5th century), Cassiodorus (5th century), or Isidorus (7th century).

After the revival of learning, the better Roman and Greek writers gradually returned into use. Some new treatises were also produced. Leonard Cox (died 1549) wrote *The Art or Craft of Rhetoryke*, partly compiled, partly original, which was reprinted in Latin at Cracow.

The Art of Rhetorique by Thomas Wilson (1553), afterwards secretary of state, embodied rules chiefly from Aristotle, with help from Cicero and Quintilian. About the same time, treatises on rhetoric were published in France by Tonquelin (1555) and Courcelles (1557). The general aim at this period was to revive and popularize the best teaching of the ancients on rhetoric. The subject was regularly taught at the universities, and was, indeed, important. At Cambridge in 1570 the study of rhetoric was based on Quintilian, Hermogenes, and the speeches of Cicero viewed as works of art. An Oxford statute of 1588 shows that the same books were used there. In 1620 George Herbert was delivering lectures on rhetoric at Cambridge, where he held the office of public orator. The decay of rhetoric as a formal study at the universities set in during the 18th century. In 1712 Steele regrets that Oxford and Cambridge have "grown dumb in the study of eloquence." The function of the rhetoric lecturer passed over into that of correcting written themes; but his title remained long after his office had lost its primary meaning. If the theory of rhetoric fell into neglect, the practice however, was encouraged by the public exercises ("acts" and "opponencies") in the schools. The college prizes for "declamations" served the same purpose.

Rhetoric
at the
universi-
ties.

The fortunes of rhetoric in the modern world, as briefly sketched above, may suffice to suggest why few modern writers of ability have given their attention to the subject. Perhaps one of the most notable modern contributions to the art is the collection of commonplaces framed (in Latin) by Bacon, "to be so many spools from which the threads can be drawn out as occasion serves," a truly curious work of that acute and fertile mind. He called them "Antitheta." A specimen is subjoined :—

UXOR ET LIBERI.

For.	Against.
"Attachment to the state begins from the family."	"He who marries, and has children, has given hostages to fortune."
"Wife and children are a discipline in humanity. Bachelors are morose and austere."	"The immortality of brutes is in their progeny; of men, in their fame, services, and institutions."
"The only advantage of celibacy and childlessness is in case of exile."	"Regard for the family too often overrides regard for the state."

This is quite in the spirit of Aristotle's treatise. The popularity enjoyed by Blair's *Rhetoric* in the latter part of the 18th and the earlier part of the present century was merited rather by the form than by the matter. Campbell's *Philosophy of Rhetoric*, which found less wide acceptance than its predecessor, was superior to it in depth, though often marred by an imperfect comprehension of logic. But undoubtedly the best modern book on the subject is Whately's *Elements of Rhetoric*. Starting from Aristotle's view, that rhetoric is "an offshoot from logic," Whately treats it as the art of "argumentative composition." He considers it under four heads :—(1) the address to the understanding (= Aristotle's *λογικὴ πίστις*); (2) the address to the will, or persuasion (= Aristotle's *ῥητορικὴ* and *παθητικὴ πίστις*); (3) style; (4) elocution, or delivery. At the outset he makes some judicious remarks on the popular objections to the art. "It has been truly observed that 'genius begins where rules end.' But to infer from this, as some seem disposed to do, that, in any department wherein genius can be displayed, rules must be useless, or useless to those who possess genius, is a very rash conclusion. What I have observed elsewhere concerning logic, that 'a knowledge of it serves to save a waste of ingenuity,' holds good in many other departments also." "A drayman, we are told, will taunt a comrade by saying, 'you're a pretty fellow,' without

Whately.

having learnt that he is employing the figure called irony." But when it is thus urged that—

"All a rhetorician's rules

"But teach him how to name his tools,"

the assumption is tacitly made that an accurate nomenclature and classification of these tools must be devoid of practical use. The conditions of modern life, and especially the invention of printing, have diminished the importance which belonged in antiquity to the art of speaking. But few would deny that a large measure of value may still be claimed for rhetoric in the more comprehensive sense which Whately gives to it, as the art of argumentative composition. His treatise, the work of an able and also witty man, will be found instructive and entertaining even by those who do not go to it for a discipline. Nor can it fail to suggest a further remark. While abounding in fresh thought and modern illustration, it constantly reminds us that, in almost all essentials, the art of rhetoric must be regarded as the creation of Aristotle. (R. C. J.)

RHEUMATISM, a constitutional disease having for its chief manifestations inflammatory affections of the fibrous textures of joints and other parts, together with a liability to various complications. Two forms of rheumatism are recognized, and will be now briefly described, namely, the acute and the chronic, the latter either resulting from the former or arising independently. In addition to these, a disease which has received the name of chronic rheumatic (or rheumatoid) arthritis, and which presents many resemblances to chronic rheumatism, although the relation between them is questionable, may be noticed here.

ACUTE RHEUMATISM, frequently called **RHEUMATIC FEVER**, is mainly characterized by inflammation affecting various joints, with a tendency to spread in an erratic manner, and accompanied with much pain, febrile disturbance, and perspiration.

The nature of this disease has been extensively discussed by pathologists and physicians; but, although numerous, and many of them ingenious, theories have been advanced and supported by evidence drawn from experimentation as well as clinical observation, it cannot yet be said that any one of them has gained general acceptance. It has been held that rheumatism is produced by an excess of lactic acid in the system in connexion with morbid states of the nutritive functions. Support to this view was given experimentally by Dr Richardson, but experiments by others have led to a different conclusion. Again, it has been held that the disease is a textural inflammation due to chill acting upon the parts, either locally through the circulation or through the agency of the nervous system, whereby the nutrition of the joints and other structures is lowered. Another view regards it as arising primarily in a profound disturbance of the heat-regulating mechanism of the body by chill, which specially affects the muscular system, causing heat to be generated without work, one of the consequences being that impressions of pain are conveyed to the brain by the articular nerves instead of those of work performed (see **PATHOLOGY**). The view has been held, too, that rheumatism is to be referred to a germ or parasite, or a miasm analogous to the poison of malaria.

Without attempting to discuss the relative probability of these and other theories, it may be stated that those which point in the direction of a nutritional change in the special tissues affected (the fibrous) as the result of chill or other depressing cause operating through the agency of the nervous system appear more consonant with the pathological evidences of the disease itself than those which would refer the morbid process to the influence of any poison circulating in the blood.

There are certain points of importance in connexion with the causation of this form of the disease which are

generally agreed upon. Thus an hereditary tendency is recognized as among the causes predisposing to acute rheumatism. The extent of this has been variously estimated, but it would appear to be well established that it shows itself in about one-fourth of the cases. Age is another important predisposing condition, the acute form of rheumatism being much more a disease of youth than of later life. The period of adolescence, from sixteen to twenty, is that in which probably the greater number of the cases occur; but even in early childhood the disease may manifest itself, or at any period of life, although it is rarely observed in old age. Persons much exposed to all kinds of weather are specially liable to suffer, and hence the disease is more common among the poorer classes. Any depressing cause acting upon the general health, such as overwork or anxiety, or any habitual drain upon the system, such as overlactation, in like manner has a similar effect. Climate, too, is a factor of great importance, for, although not unfrequently met with in temperate or even warm climates, the disease is unquestionably of more common occurrence in cold and damp regions. Attacks of acute rheumatism are brought on in most instances by exposure to cold, by getting wet through, sometimes also by excessive fatigue such as in walking long distances, especially if in addition there have been overheating of the body and subsequent chill. Persons who have once suffered from this disease are very liable to a recurrence on a renewal of the exciting cause, and even apparently independently of this from such causes as digestive disturbances.

An attack of acute rheumatism is usually ushered in by chilliness or rigors followed with feverishness and a feeling of stiffness or pain in one or more joints, generally those of larger or medium size, such as the knees, ankles, wrists, shoulders, &c., which soon becomes intense, and is accompanied with severe constitutional disturbance and prostration. The patient lies helpless in bed, restless, but afraid to move or to be touched, and unable to bear even the weight of the bed-clothes. The face is flushed, and the whole body bathed in perspiration, which has a highly acid reaction and a sour disagreeable odour. The temperature is markedly elevated (103° to 105°), the pulse rapid, full, and soft; the tongue is coated with a yellow fur; and there are thirst, loss of appetite, and constipation. The urine is diminished in quantity, highly acid, and loaded with urates. At first the pain is confined to only one or two joints, but soon others become affected, and there is often a tendency to symmetry in the manner in which they suffer, the inflammation in one joint being shortly followed by that of the same joint in the opposite limb. The affected joints are red, swollen, hot, and excessively tender. The inflammation seldom continues long in one articulation, but it may return to those formerly affected. In severe cases scarcely a joint large or small escapes, and the pain, restlessness, and fever render the patient's condition extremely miserable.

An attack of acute rheumatism is of variable duration, sometimes passing away in the course of a few days, but more frequently lasting for many weeks. Occasionally, when the disease appears to have subsided, relapses occur which bring back all the former symptoms and prolong the case, it may be for months. Again, after all acute symptoms have disappeared, the joints may remain swollen, stiff, and painful on movement, and the rheumatic condition thus becomes chronic.

After an attack of rheumatism, the patient is much reduced in strength and pale-looking for a considerable time, but should no complication have arisen there may be complete recovery, although doubtless there remains a liability to subsequent attacks. This disease derives much of its serious import from certain accompaniments

or complications which are apt to attend its progress. Among these may be mentioned excessive fever (hyperpyrexia), which is sometimes developed in a sudden and alarming manner, the temperature rising quickly to 108°–110° or more, and thus endangering life. Indeed in most of such instances death speedily follows unless prompt treatment be resorted to. Another danger is the occurrence of serious head symptoms in the form of delirium or excitement, which may exist in conjunction with hyperpyrexia or independently. Chorea or St Vitus's dance is also an occasional accompaniment of acute rheumatism. Besides these, other complications pertaining to the respiratory organs, such as pleurisy, pneumonia, bronchitis, &c., sometimes arise in the course of the disease, as well as certain disorders of the skin. But the most frequent and important of all are those affecting the heart. These cardiac affections are regarded by some as an integral part of the rheumatic disease rather than as results of it, especially as it would seem that occasionally they are the only local manifestation of the attack.

Pericarditis (inflammation of the investing membrane of the heart) and endocarditis (inflammation of the lining membrane of the heart) are the two most common forms which these heart complications assume, and it is the latter which is specially important as tending to lay the foundation for valvular heart disease (see HEART). It is the liability to these inflammatory heart affections that causes special anxiety during the earlier stages of an attack of acute rheumatism, when it would appear they are more apt to occur. The risk of cardiac complications seems to be greater the younger the patient, and doubtless the foundation of organic heart disease is often laid in early childhood, when, as is now well known, rheumatism is by no means uncommon.

The name *subacute rheumatism* is sometimes applied to attacks of the disease of less severe type than that now described, but where yet the symptoms exist in a well-marked degree. Cases of this kind may be of even longer duration and more intractable than the more acute variety, although probably the danger to the heart is less.

CHRONIC RHEUMATISM appears occasionally to be developed as the result of the acute form, but is more frequently an independent constitutional affection, and is usually a complaint of later life. The causes associated with its occurrence are habitual exposure to cold and damp; hence its frequency among outdoor workers. It is also apt to arise in persons debilitated by overwork or privation. Certain poisons introduced into the system are often attended with symptoms of chronic rheumatism, *e.g.*, lead, syphilis, &c. This disease is often hereditary. It differs from acute rheumatism in being less frequently attended with fever and constitutional disturbance and less liable to dangerous complications, but on the other hand it is much more apt to produce permanent alterations in the joints and parts affected. The joints tend to become swollen both from effusion of fluid and from chronic inflammatory thickening of the textures, and the result is stiffness and sometimes complete immobility. But in addition the sheaths of muscles and of nerves are apt to be affected by chronic rheumatism, causing much suffering. This form of rheumatism is less migratory in its progress than the acute, and tends to remain fixed in a few joints, often in those which are specially exposed to atmospheric influences or to overwork. The chief symptoms are pain and stiffness in movement, more particularly when the efforts begin to be made, becoming less after the limbs and body have been in exercise. Creaking or crackling noises accompany the movements. The pain is apt to be increased during the night, and is besides markedly influenced by the state of the atmosphere, cold and damp aggravating it.

This form of rheumatism, although not directly dangerous to life, tends to lower the health and render the patient more vulnerable to other morbid influences. Besides this, by long continuance it may lead to great deformity and disablement of the frame, in some instances resulting in a condition of utter helplessness.

Treatment.—Few diseases have had so many remedies recommended for their alleviation, and vaunted as specifics, as rheumatism; and, when it is remembered how many are the theories of the nature of the malady, it is obvious that even as regards principles the methods proposed must be numerous and diverse. Nevertheless, there are certain well-recognized systems of treatment which in most instances will be found to be of benefit. The treatment differs in the two forms of the disease. As regards acute rheumatism the general management of the case from the outset requires attention. The patient should be placed in bed between blankets, and should wear a flannel shirt, the front and arms of which should be opened to admit of the examination of the heart and of the joints. Movements of all kinds should be as far as possible avoided. The affected joints should be enveloped in cotton wool, kept in position by a light bandage. Sometimes the bathing of these parts with warm water containing opium or other sedative affords relief. The local application of blisters in the neighbourhood of the painful joints, as proposed by Dr Herbert Davies, is in some instances followed with benefit, but is obviously applicable only where the rheumatism is limited in its extent. The same may be said of the local application of electricity to the joints. Constitutional remedies are of undoubted value in this disease, and the number of available agents for this purpose is so large that mention can only be briefly made of some of the more approved. For long the alkalis, especially the salts of potassium, were the chief remedies resorted to, and for them it was claimed that they shortened the attack, relieved pain, and prevented heart complications. They are certainly very valuable in many instances. Of late a new series of substances has been tried with great success, namely salicin (first suggested for acute rheumatism by Dr T. J. MacLagan), salicylic acid, and salicylate of soda. These remedies, which are known to have a powerful effect in reducing febrile temperatures, appear to exercise a special influence in acute rheumatism, not merely by lowering the fever, but by relieving pain and cutting short the attack, thereby lessening the risk of complications. From 20 to 30 grains of these drugs every two hours require to be given for about twenty-four hours in order to produce the desired effect, and the quantity is reduced as the acute symptoms subside. Although they do not succeed in all cases, and sometimes give rise to symptoms (delirium, sickness, &c.) which necessitate their suspension, it will be admitted by most physicians that cases which appeared likely to be of a severe character have under this treatment been cut short in a few days, and that even where this result was not attained the pain and other distressing symptoms were materially alleviated. Tonics, such as iron and quinine, have also been employed in acute rheumatism, but their advantage is more apparent in the convalescence, when there are anæmia and debility, rather than in the height of the disease. The pain and sleeplessness may render necessary the administration of opiates, but in many instances both are completely overcome by the remedies previously mentioned. In the dangerous complication of hyperpyrexia the cold bath (in which the water is quickly cooled down from 94° to 68°) has frequently been successful in speedily lowering the temperature and saving life. Persons who have suffered from acute rheumatism should ever afterwards be careful to avoid exposure to

damp and chill, and to protect the skin by suitable under-clothing.

In chronic rheumatism the remedies are innumerable. This form of the disease is less under the power of medicinal agents than the acute, although much may be done to alleviate the suffering produced by it as well as to limit its extension. Salicin and the salicylates so useful in acute rheumatism are not found as a rule to be of much service, while on the other hand alkalis in combination with sulphur, iodine, arsenic, and tonics, such as iron, quinine, cod-liver oil, &c., are the most serviceable remedies. Turpentine is also recommended. Friction of the affected parts with stimulating or soothing liniments, counter-irritation with blisters, iodine, or the button cautery are useful local applications, as is also galvanism. Hot baths or Turkish baths may occasionally be used with advantage. The mineral waters and baths of various well-known resorts are of undoubted benefit, especially those of Buxton, Bath, Strathpeffer, or Harrogate in Great Britain, or those of Aix-les-Bains, Wiesbaden, Homburg, Ems, Wildbad, Aix-la-Chapelle, and many others on the Continent. Changes to warmer climates during the colder season where practicable are also to be recommended, as well as every other measure calculated to improve the general health.

RHEUMATOID ARTHRITIS.—This term (syn. *chronic rheumatic arthritis*, *arthritis deformans*) is employed to designate a chronic inflammatory affection of joints, involving specially the synovial membranes and articular cartilages, of slow development and progressive character, resulting in stiffening and deformity of the parts.

This disease is held by some to partake of the nature of both rheumatism and gout (hence occasionally termed rheumatic gout); others regard it as simply a variety of chronic rheumatism; while in the opinion of several eminent authorities it is an independent constitutional affection occurring in persons with a strumous or tubercular tendency. It does not appear to be hereditary. It is more common in women than in men, and occurs at all ages. It is closely connected with conditions of ill health; and hence its frequent occurrence among those whose blood is impoverished by insufficient food, by hardship, or by any drain upon the system. It occasionally follows an attack of acute rheumatism; hence the supposed connexion.

The disease in most cases is slowly developed, and shows itself first by pain and swelling in one joint (knee, wrist, finger, &c.), which soon subsides and may remain absent for a considerable time. Sooner or later, however, another attack occurs either in the joint formerly affected or in some other, and it is noticed that the affected articulation does not now regain its normal size but remains somewhat swollen. The attacks recur with increasing frequency, gradually involving more joints, until, in course of time (for its progress is very chronic), scarcely an articulation in the body is free from the disease. Thickening of the textures, with stiffness, is the result, and often considerable deformity from the joints being fixed in certain positions. The muscles of the affected limbs undergo atrophy and contrast strikingly with the abnormally enlarged joints. Painful inflammatory attacks often occur in the affected joints, and the patient is much reduced in strength by the constant irritation of the disease. In the young the hands are very liable to suffer, and the disease gradually extends to involve other parts; while in old persons it is apt to fasten upon one joint, often the hip, and is not so apt to spread. The chief changes in the joints are (1) in the synovial membrane, which is at first simply inflamed and contains fluid, but ultimately becomes much thickened, and (2) in the articular cartilage, which tends to split up and become gradually absorbed, leaving the articular ends of the bone exposed. The osseous surfaces thus brought into

contact become hard and polished by friction. These changes and others affecting the ligaments are apt to produce partial dislocation as well as stiffening of the joint, rendering it deformed and useless. This disease often lasts for many years, sometimes continuing for a lengthened period without much change, but tending gradually to progress and to render the patient more and more helpless. It is not attended with the complications of rheumatism, and is not inconsistent with long life, but its weakening effects upon the system and the ill health with which it is usually associated render the subject of it more liable to the inroads of other diseases. Rheumatoid arthritis is less amenable to treatment than rheumatism, the remedies for which are not found to be of much value in this disease. Most success is obtained if it is recognized early and measures are taken to strengthen the patient's general health. The best medicinal agents are iron, quinine, cod-liver oil, arsenic. Chalybeate mineral waters, such as those of Schwalbach, Spa, Pyrmont, &c., are often of service. Locally blisters or milder counter-irritation to the affected joints, as well as the employment of galvanism, may be advantageously resorted to. (J. O. A.)

RHEYDT, a manufacturing town of Rhenish Prussia, is situated on the Niers, 14 miles to the west of Düsseldorf. The principal products of its numerous factories are silk, cotton, woollen, and mixed fabrics, iron goods, machinery, lamp wicks, and roofing pasteboard. Dyeing and finishing are also carried on. The most prominent buildings are the old parish church and a new one erected in 1866. Rheydt is an ancient place, but its industrial importance is of very recent growth. At the beginning of the present century it did not contain more than 2000 to 3000 inhabitants, whereas in 1880 the population of the municipal commune was 19,087, two-thirds of whom were Protestants.

RHIN, HAUT, a department of France. See **FRANCE**, vol. ix. p. 508.

RHINE (Lat. *Rhenus*, Germ. *Rhein*, Fr. *Rhin*, Dutch *Rhijn*), the chief river of Germany and one of the most important in Europe, is about 800 miles in length and drains an area of 75,000 square miles.¹ The distance in a direct line between its source in the Alps and its mouth in the German ocean is 460 miles. Its general course is north-north-west, but it makes numerous deflexions and at one point is found running in a diametrically opposite direction. About 250 miles of its length are in Switzerland, 450 in Germany, and 100 in Holland; but the German half is in every respect so much the more important that it is no misnomer to call the Rhine a German river, even if the word German be confined to its modern political signification. The name Rhine, which is apparently of Celtic origin, is of uncertain import, but has been supposed to mean "flowing" or "clear." The sources of the Rhine are found in the Swiss canton of Grisons, where the drainage of at least 150 glaciers unites to form its headwaters. Among these streams, all of which are termed Rhin in the Ladine dialect of the district, two are generally recognized as the main sources of the river, viz., the Vorder Rhein and the Hinter Rhein. The chief feeder of the former rises in the small Lake of Toma, situated on the south-east slope of the St Gotthard,² at a height of 7690 feet above the sea and at no great distance from the source of the Rhone, which rises on the west side of the same mountain mass. It first flows to the east, receiving the waters of the Medelser Rhein and several other glacier streams, and after a course of about

¹ This is the current estimate, but Strelbitzki, the latest authority, does not allow the Rhine a length of more than 710 miles.

² "Reticarum Alpium inaccessio ac præcipiti vertice," says Tacitus.

45 miles unites with the Hinter Rhein at Reichenau. As far as Ilanz the Vorder Rhein is simply a mountain torrent, descending 1200 feet in the first 12 miles of its course. At Disentis, where it is joined by the Medelser Rhein, it is 15 feet wide, and at Ilanz it is about thrice as large. The Hinter Rhein has its cradle in the Rheinwald glacier, near the St Bernardino Pass, 7270 feet above the sea and 40 miles south of Reichenau. The Vorder Rhein contributes the greater volume of water to the joint stream, but the Hinter Rhein belongs to a more developed system.

Beyond Reichenau the united stream, 150 feet in width, bears the name of Rhine without any qualifying epithet. It is now navigable for rafts, and small boats begin to be seen a little further on, at Coire, where it turns to the north. On reaching the Lake of Constance the Rhine deposits the debris that it has brought down from its mountain sources, and the stream that emerges from the west end of the Untersee is of a clear deep green colour. Between the Lake of Constance and Basel the Rhine flows towards the west and practically forms the boundary between Germany and Switzerland. At Schaffhausen, in penetrating the barrier of the Jura, it forms the imposing falls of the Rhine, where it is precipitated over a ledge of rock in three leaps 50 or 60 feet in height. Near Lauterburg, where the river encounters the gneiss of the Black Forest, is a series of formidable cataracts, and about 15 miles lower down are the rapids of Rheinfelden. At Basel, which it reaches after a tortuous course of 250 miles, though it is only about a third of that distance from its source in a direct line, the Rhine turns once more to the north and enters Germany. Its breadth here is between 550 and 600 feet, while its surface now lies not more than 800 feet above the sea, showing that the river has made a descent of 6900 feet by the time it has traversed a third of its course. From Basel to Mainz the Rhine flows through a wide and shallow valley, bordered on the east and west by the parallel ranges of the Black Forest and the Vosges. Its banks are low and flat, and numerous islands occur. The tendency to divide into parallel branches has been curbed in the interests of navigation, and many windings have been cut off by leading the water into straight and regular channels. At Mannheim the river is nearly 1500 feet in width, and at Mainz, where it is diverted to the west by the barrier of the Taunus, it is still wider. It follows the new direction for about 20 miles, but at Bingen it again turns to the north and begins a completely new stage of its career, entering a narrow valley in which the enclosing rocky hills abut so closely on the river as often barely to leave room for the road and railway on the bank. This is the most beautiful part of the whole course of the river, abounding in the ruined castles, the romantic crags, the sunny vineyards, and the picturesque lateral ravines that have combined to make the Rhine so favourite a resort of lovers of natural beauty. At Coblenz the valley widens and the river is 1200 feet broad, but the hills close in again at Andernach, and this ravine-like part of its course cannot be considered as ending till below the Seven Mountains, where the river once more expands to a width of 1300-1600 feet. Beyond Bonn and Cologne the banks are again flat and the valley wide, though the hills on the right bank do not completely disappear till the neighbourhood of Düsseldorf. Further on the country traversed by the Rhine is perfectly level, and the current becomes more and more sluggish. On entering Holland, which it does below Emmerich, its course is again deflected to the west. Within Holland the banks are so low as to require at places to be protected by embankments against inundations. The river now loses its individuality in a number of separate branches, and the name of Rhine has often arbitrarily clung to the smaller arm after a bifurcation. Almost

immediately after entering Holland the stream divides into two arms, the larger of which, carrying off about two-thirds of the water, diverges to the west, is called the Waal, and soon unites with the Maas. The smaller branch to the right retains the name of Rhine and sends off another arm, called the Yssel, to the Zuyder Zee. The Rhine now pursues a westerly course almost parallel with that of the Waal. At Wijk another bifurcation takes place, the broad Lek diverging on the left to join the Maas, while the "Kromme Rhijn" to the right is comparatively insignificant. Beyond Utrecht, where it is again diminished by the divergence of the Vecht to the Zuyder Zee, the river under the name of the "Oude Rhijn" or Old Rhine degenerates into a sluggish and almost stagnant stream, which requires the artificial aid of a canal and sluices in finding its way to the sea. In Roman times the Rhine at this part of its course seems to have been a full and flowing river, but by the 9th century it had lost itself in the sands of Katwijk, and it was not until the beginning of the 19th century that its way to the sea was re-opened. Though the name Rhine thus at last attaches to a very insignificant stream, the entire district between the Waal on one side and the Yssel on the other, the *Insula Batavorum* of Cæsar, in reality belongs to the delta of the famous river.¹ See vol. xii. Plate I.

The Rhine is said to receive, directly or indirectly, the waters of upwards of 12,000 tributaries of all sizes. Leaving out of account the innumerable glacier streams that swell its volume above the Lake of Constance, the most important affluents to its upper course are the Wutach, the Alb, and the Wiese, descending on the right from the Black Forest, and the Aar, draining several Swiss cantons on the left. In the Upper Rhenish basin, between Basel and Mainz, the tributaries, though numerous, are mostly short and unimportant. The Ill and the Nahe on the left and the Neckar and the Main on the right are, however, notable exceptions. Before joining the Rhine the Ill runs almost parallel with it and at no great distance for upwards of 50 miles. In the narrow part of the valley, between Bingen and Cologne, the Rhine receives the waters of the Lahn and the Sieg on the right, and those of the Moselle² (bringing with it the Saar) and the Ahr on the left. Still lower down, but before the Dutch frontier is reached, come the Ruhr and the Lippe on the right, and the Erft on the left. The numerous arms into which the Rhine branches in Holland have already been noticed.

The Rhine connects the highest Alps with the mud banks of Holland, and touches in its course the most varied geological periods; but the river valley itself is, geologically speaking, of comparatively recent formation. Rising amid the ancient gneiss rocks of the St Gotthard, the Rhine finds its way down to the Lake of Constance between layers of Triassic and Jurassic formation; and between that lake and Basel it penetrates the chalk barrier of the Jura. The upper Rhenish valley is evidently the bed of an ancient lake, the shores of which were formed by the gneiss and granite of the Black Forest on the one side and the granite and sandstone of the Vosges on the other. Within the valley all the alluvial

¹ The nomenclature of the Rhine branches in the Netherlands is, according to Mr J. Dirks, a singular but historic system, by which the rivers are chopped up, as it were, into longitudinal pieces.

² The Moselle rises in France, in the canton of Ramonchamp, at a height of 2379 feet above the sea, on the west side of the Vosges. Its length is 315 miles (of which 190 are in France), but the direct line from source to confluence is only about 170 miles. At Épinal (1040 feet) the Moselle passes out of the rocky mountain-glen where its course has hitherto been. It enters the Lorraine plateau, but the sides of the valley still remain high and steep. Below Metz (550 feet) the bottom-lands spread out to a considerable width; in the section between Sierck and Coblenz the hills again close in upon the river. Rafts can generally be floated from Arches down to Frouard, and there, by the junction of the Meurthe (itself navigable, though with difficulty, from Nancy), the depth becomes sufficient for boats. Since 1840 steamboats have plied between Treves and Coblenz.

deposits are recent. Between Bingen and Bonn the Rhine forces its way through a hilly and rocky district belonging to the Devonian formation. The contorted strata of slate and greywacke rock must have been formed at a period vastly anterior to that in which the lake of the upper valley managed to force an outlet through the enclosing barriers. Probably this section may be looked upon as the oldest portion of the river course proper, connecting the upper Rhenish lake with the primeval ocean at Bonn. In this district too, as has already been remarked, is the finest scenery of the Rhine, a fact due in great part to the grotesque shapes of the quartzose rocks, left denuded of the less durable slate and sandstone. All the strata intersected by the Rhine between Bingen and Bonn contain fossils of the same classes. The deposits of the actual valley here, belonging to the Miocene group of the Tertiary system, are older than the deposits either farther up or farther down the river; but they are contemporaneous with the basalts of the Rhine, which at Coblenz and in the peaks of the Seven Mountains also contribute to the scenic charm of the river. The very extensive pumice deposits at Neuwied and the lava and other volcanic rocks belong to a more recent epoch. Below Bingen the formations belong almost entirely to the Post-Tertiary period. Numerous extinct volcanoes rise near Neuwied. In the flatter parts of the valley occur large beds of loam and rubble, sometimes in terraces parallel with, but several hundred feet above, the river,—proving by their disposition and appearance that the valley has been formed by the action of water.

The Rhine has been one of the chief waterways of Europe from the earliest times; and, as its channel is not exposed to the danger of silting up like those of the Elbe and the Oder, it has always been comparatively easy to keep it open. The Romans exerted themselves to improve the lower navigation of the river, and appointed prefects of the Rhine to superintend the shipping and to exact the moderate dues imposed to keep the channel in repair. The Franks continued the same policy and retained a system of river-dues. Afterwards as the banks became parcelled out among a host of petty princelings, each of whom arrogated the right of laying a tax on passing vessels, the imposts became so prejudicial as seriously to hamper the development of the shipping. Many of the riparian potentates derived the bulk of their revenue from this source, and it is calculated that in the 18th century the Rhine yielded a total revenue of £200,000, in spite of the comparatively insignificant amount of the shipping. The first proposal for a free Rhine was mooted by the French at the congress of Rastatt (1797–1799), but Holland, commanding the mouth of the river, placed every obstacle in the way of the suggestion. In 1831, on the separation of Holland and Belgium, the former had become more amenable to reason; and a system was agreed upon which practically gave free navigation to the vessels of the riverine states, while imposing a moderate tariff upon foreign ships. It was not, however, till 1869 that the last vestige of a toll disappeared and the river was thrown open without any restriction. The management of the channel and navigation is now vested in a Central Commission, meeting at Mannheim. The channel has been greatly improved and in many places made more direct since the beginning of the present century,—large sums being annually spent in keeping it in order. Capacious river harbours have been formed at various points, about twenty-five of these being in Germany and eight or ten more in Holland. The total weight of the goods forwarded each year on the Rhine has of late amounted to nearly 1,000,000 tons, the chief articles being timber, coal, iron, agricultural produce, and manufactured goods of various kinds. The position of the river is highly favourable for the development of its trade. It flows through the most populous regions of the continent of Europe, to discharge into one of the most frequented seas opposite Great Britain, and, besides serving as a natural outlet for Germany, Belgium, and Holland, is connected with a great part of central and southern France by the Rhine-Rhone and the Rhine-Marne Canals, and with the basin of the Danube by the Ludwigs-Canal.

The introduction of steam has greatly increased the shipping on the Rhine; and small steamers ply also on the Main, the Neckar, the Maas, and the Moselle. The first Rhine steamer was launched in 1817; and now the river is regularly traversed by upwards of a hundred, from the small tug up to the passenger saloon-steamer. The steamboat traffic has especially encouraged the influx of tourists, and the number of passing travellers may now be reckoned as between one and two millions annually. The river is navigable without interruption from Basel to its mouth, a distance of 550 miles, of which 450 lie within Germany. Above Spire, however, the river craft are comparatively small, but lower down vessels of 500 and 600 tons burden find no difficulty in plying. Between Basel and Strasburg the depth of water is sometimes not more than 3 feet; between Strasburg and Mainz it varies from 5 to 25 feet; while below Mainz it is never less than 9 or 10 feet. The deepest point is opposite the Lurlei Rock near St Goar, where it is 75 feet in depth; at Düsseldorf the depth is about 50 feet. One of the most interesting features of the Rhine navigation is

afforded by the huge rafts of timber that are floated down the river. Single tree trunks sent down to the Rhine by the various tributaries are united into small rafts as they reach the main stream; and these again are fastened together to form one large raft about Andernach. Though not so large as formerly, these timber-rafts are still sometimes 400 or 500 feet in length, and are navigated by 200 to 400 men, who live in little huts on the raft, forming actual floating villages. On reaching Dort the rafts are broken up and sold, a single raft sometimes producing as much as £80,000. The voyage from Bingen to Dort takes from one to six weeks, and the huge unwieldy structures require to be navigated with great care. The commerce carried on by the river itself is supplemented by the numerous railways, which skirt its banks and converge to its principal towns. Before the introduction of railways there were no permanent bridges across the Rhine below Basel; but now trains cross it at about a dozen different points in Germany and Holland.

The salmon fisheries of the Rhine, lying mainly between Bacharach and St Goar, have long been famous; but their produce has been seriously diminished since the advent of the steamer. Pike, carp, and other white fish are also caught. A little gold is brought down by the Rhine from the Alps and the heights of the Black Forest, but not in sufficient amount to make its collection of economic value. The white wines of the Rhine are the finest in the world, though the palm in red wines must be given to the vineyards of Bordeaux. The vineyards lie mainly between Mainz and Bonn, a distance of 90 miles,—the choicest varieties of wine being produced in the Rheingau, a picturesque district on the right bank between Rüdesheim and Biebrich, about 12 miles long and 5 broad. The well known brands Johannisberger, Steinberger, Marobrunner, and Assmannshäuser are all grown in this narrow compass. The valleys of the Neckar, the Moselle, the Nahe, and other tributaries of the Rhine also yield good wine; and the valley of the Ahr may be indicated as the northern limit of the wine culture. The total annual value of the Rhenish wines is about £2,400,000.

The long array of ancient and flourishing towns along its banks bear witness to the great importance of the river. These are most frequent in the upper Rhenish basin and again below Bonn, the places in the narrower part of the valley being generally more remarkable for their picturesque situation than for their commercial or political influence. Beyond the borders of Germany the only large towns on the Rhine are Basel in Switzerland, and Arnheim, Utrecht, and Leyden in Holland. Within Germany, as we trace the course of the river from south to north, we come successively to Spire, Mannheim, Mainz, Coblenz, Bonn, Cologne, Düsseldorf, and Wesel. Worms, which was formerly washed by the Rhine, lies about $\frac{3}{4}$ mile distant from the present course; and Strasburg, which lies on the Ill, 2 miles from the Rhine, may also be reckoned as one of its towns.

Politically the Rhine has always played a great part; and it would require no great straining to write a history of this majestic river which would also be a history of the western half of continental Europe. The whole valley seems to have been originally occupied by Celtic tribes, who have left traces of their presence on the contents of tombs and in the forms of names (Moguntiacum or Mainz, Borbetomagus or Worms, &c.); but at the beginning of the historical period we find the Celts everywhere in retreat before the advancing Teutons. Probably the Teutonic pressure began as early as the 4th century before Christ, and the history of the next few hundred years may be summed up as the gradual substitution of a Germanic for a Celtic population along the banks of the Rhine. Its second historical period begins with the advent of the Romans, who stemmed the advancing Teutonic tide. Augustus and his successors took good care to fortify the Rhine carefully, and a large proportion of the Roman legions were constantly in garrison here. For two hundred years the Rhine formed the boundary between the Roman empire and the Teutonic hordes; and during that period the left or Roman bank made prodigious strides in civilization and culture. The wonderful Roman remains at Treves and elsewhere, the Roman roads, bridges, and aqueducts, are convincing proofs of what the Rhine gained from Roman domination. This Roman civilization was, however, destined to be swamped by the current of Teutonic immigration, which finally broke down the barriers of the Roman empire and overwhelmed the whole of the Rhenish district. Under Charlemagne, whose principal residence was in Aix-la-Chapelle, the culture of the Rhine valley again began to flourish, its results being still to be traced in the important architectural remains of this period. At the partition of the domains of Charlemagne in 843 A.D. the Rhine formed the boundary between Germany and the middle kingdom of Lotharingia; but by 870 it lay wholly within the former realm. For nearly eight hundred years it continued in this position, the frontier of the German empire coinciding more or less with the line of the Rhine. During the early Middle Ages the bank of the Rhine formed the most cultured part of Germany, basing its civilization on its Roman past. The Thirty Years' War exercised

a most prejudicial effect upon the district of the Rhine; and the peace of Westphalia gave France a footing on the left bank of the hitherto exclusively German river by the acquisition of Alsace. The violent seizure of Strasburg by France in 1681 was ratified by the peace of Ryswick in 1697, which recognized the Rhine as the boundary between Germany and France from Basel to about Germersheim. It was an easy inference for the French mind that the Rhine should be the boundary throughout and the Gaul of Cæsar restored. This ideal was realized in 1801, when the whole of the left bank of the Rhine was formally ceded to France. The congress of Vienna (1815) restored the lower part of the Rhenish valley to Germany, but it was not till the war of 1870-71 that the recovery of Alsace and Lorraine made the Rhine once more "Germany's river, not Germany's frontier." In the military history of all these centuries constant allusion is made to the Rhine, its passages, and its fortresses. Every general who has fought in its neighbourhood has at one time or another had to provide for a crossing of the Rhine, from Julius Cæsar, who crossed it twice, down to our own time. The wars carried on here by his Most Christian Majesty Louis XIV. are still remembered in the Rhine district, where the devastations of his generals were of the most appalling description; and scarcely a village or town but has a tale to tell of the murder and rapine of this period.

The Rhine has always exercised a peculiar sort of fascination over the German mind, in a measure and in a manner not easily paralleled by the case of any other river. "Father Rhine" is the centre of the German's patriotism and the symbol of his country. In his literature it has played a prominent part from the *Nibelungenlied* to the present day; and its weird and romantic legends have been alternately the awe and the delight of his childhood. The Rhine was the classic river of the Middle Ages; and probably the Tiber alone is of equal historical interest among European rivers. Victor Hugo has perhaps best described the mingled feelings which the Rhine awakens. "Le Rhin," he says, "réunit tout. Le Rhin est rapide comme le Rhône, large comme la Loire, encaissé comme la Meuse, tortueux comme la Seine, limpide et vert comme la Somme, historique comme le Tibre, royal comme le Danube, mystérieux comme le Nil, pailleté d'or comme un fleuve d'Amérique, couvert de fables et de fantômes comme un fleuve d'Asie." (J. F. M.).

RHINOCEROS, a name applied by the ancients to an animal the most striking external peculiarity of which is certainly the horn growing above its nose (*ῥινόκερως*, nose-horn).

The various existing and extinct species are grouped into a family, *Rhinocerotidae*, which is a division of the Perissodactyle (odd-toed) section of the great order of *Ungulata* or hoofed mammals, of which section the tapirs and horses are the only other surviving members (see *MAMMALIA*, vol. xv. p. 428).

The following are the general characters applicable to all the members of the family.

First, as regards dentition. Incisors variable, generally reduced in number and often quite rudimentary, and early deciduous. Canines, in existing species, absent. Molar series, consisting of the full number of four premolars and three molars above and below, all in contact and closely resembling each other, except the first, which is

obliquely inwards and backwards from it, terminating internally in conical eminences or columns, and enclosing a deep (middle) sinus between. The posterior sinus is formed behind the posterior transverse ridge, and is bounded externally by a backward continuation of the outer wall and behind by the cingulum. The anterior sinus is formed in the same manner, but is much smaller. The middle sinus is often intersected by vertical laminæ ("combing plates") projecting into it from the anterior surface of the posterior transverse ridge or from the wall, the development of which is a useful guide in discriminating the species, especially those no longer existing and known only by the teeth and bones. The depressions between the ridges are not filled up with cementum as in the horse. The lower molars have the crown formed by a pair of crescents; the last has no third lobe or talon.

Head large, skull elongated, elevated posteriorly into a transverse occipital crest. No post-orbital processes or any separation between orbits and temporal fossæ. Nasal bones large and stout, co-ossified, and standing out freely above the premaxillæ, from which they are separated by a deep and wide fissure; the latter small, generally not meeting in the middle line in front, often quite rudimentary. Tympanics small, not forming a bulla. Brain cavity very small for the size of the skull. Vertebrae:—cervical, 7; dorsal, 19-20; lumbar, 3; sacral, 4; caudal, about 22. Limbs stout, and of moderate length. Three completely developed toes, with distinct broad rounded hoofs on each foot.¹ Mammary two, inguinal. Eyes small. Ears of moderate size, oval, erect, prominent, placed near the occiput. Skin very thick, in many species thrown into massive folds. Hairy covering scanty. All existing species have one or two median horns on the face. When one is present it is situated over the conjoined nasal bones; when two, the hinder one is over the frontals. These horns, which are of a more or less conical form and usually recurved, and often grow to a great length (three or even four feet), are composed of a solid mass of hardened epidermic cells growing from a cluster of long dermal papillæ. The cells formed on each papilla constitute a distinct horny fibre, like a thick hair, and the whole are cemented together by an intermediate mass of cells which grow up from the interspaces between the papillæ. It results from this that the horn has the appearance of a mass of agglutinated hairs, which, in the newly growing part at the base, readily fray out on destruction of the softer intermediate substance; but the fibres differ from true hairs in growing from a free papilla of the derm, and not within a follicular involution of the same.

The *Rhinocerotidae* are all animals of large size, but of little intelligence, generally timid in disposition, though ferocious when attacked and brought to bay, using the nasal horns as weapons, by which they strike and toss their assailant. Their sight is dull, but their hearing and scent are remarkably acute. They feed on herbage, shrubs, and leaves of trees, and, like so many other large animals which inhabit hot countries, sleep the greater part of the day, being most active in the cool of the evening or even during the night. They are fond of bathing and wallowing in water or mud. None of the species have been domesticated. Animals of the group have existed in both the Old and New Worlds since the beginning of the Miocene period. In America they all became extinct before the end of the Pliocene period. In the Old World their distribution has become greatly restricted, being no longer found in Europe and North Asia, but only in Africa and in portions of the Indian and Indo-Malayan regions.

FIG. 1.—Grinding surface of a moderately worn right upper second molar of Rhinoceros. A, *Rhinoceros unicornis*; B, *Rhinoceros sondaicus*. 1, anterior surface; 2, posterior surface; 3, internal surface; 4, external surface (wall or dorsum); 5, antero-internal pillar or cusp; 6, postero-internal pillar or cusp; 7, anterior sinus; 8, median sinus; 9, posterior sinus; 10, accessory sinus or valley; 11, crista (anterior combing plate); 12, crochet (posterior combing plate).

much smaller than the rest and often deciduous. The others gradually increasing in size up to the penultimate. The upper molars have a very characteristic pattern of crown, having a much-developed flat or more or less sinuous outer wall, and two transverse ridges running

¹ In some extinct species a small outer toe is present on the forefoot.

The existing species of rhinoceros are naturally grouped into three sections, which some zoologists consider of generic value.

I. *Rhinoceros* proper. The adults with a single large compressed incisor above on each side, and occasionally a small lateral one; below, a very small median, and a very large, procumbent, pointed lateral incisor. Nasal bones pointed in front. A single nasal horn. Skin very thick, and raised into strong, definitely arranged ridges or folds.

There are two well-marked species of one-horned rhinoceroses. (1) The Indian Rhinoceros, *R. unicornis* of Linnaeus,¹ the largest and best known, from being the most frequently exhibited alive in England, is at present only

FIG. 2.—Indian Rhinoceros (*Rhinoceros unicornis*). This and the following woodcuts are reduced from drawings by J. Wolf, from animals living in the London Zoological Society's Gardens.

met with in a wild state in the terai region of Nepal and Bhutan, and in the upper valley of the Brahmaputra or province of Assam, though it formerly had a wider range.

FIG. 3.—Javan Rhinoceros (*Rhinoceros sondaicus*).

The first rhinoceros seen alive in Europe since the time when they, in common with nearly all the large remarkable beasts of both Africa and Asia, were exhibited in the

¹ Many authors use Cuvier's name, *R. indicus*, in preference to this, on the ground that there are more than one species with one horn, forgetting that the name substituted is equally inconvenient, as more than one species live in India. The fact of a specific name being applicable to several members of a genus is no objection to its restriction to the first to which it was applied; otherwise changes in old and well-received names would constantly have to be made in consequence of new discoveries.

Roman shows, was of this species. It was sent from India to Emmanuel, king of Portugal, in 1513; and from a sketch of it, taken in Lisbon, Albert Dürer composed his celebrated but rather fanciful engraving, which was reproduced in so many old books on natural history. (2) The Javan Rhinoceros, *R. sondaicus*, Cuvier, is distinguished by smaller size, special characters of the teeth and skull, and different arrangement of the plications of the skin (as seen in the figures); the horn in the female appears to be very little developed, if not altogether absent. This has a more extensive geographical range, being found in the Bengal Sunderbans near Calcutta, Burmah, the Malay Peninsula, Java, Sumatra, and probably Borneo.

II. *Ceratorhinus*. The adults with a moderate-sized compressed incisor above, and a laterally placed, pointed, procumbent incisor below, which is sometimes lost in old animals. Nasal bones narrow and pointed anteriorly. A well-developed nasal, and a small frontal horn separated by an interval. The skin thrown into folds, but these not so strongly marked as in the former section. The smallest living member of the family, the Sumatran Rhinoceros, *R. sumatrensis*, Cuv., belongs to this group. Its geographical range is nearly the same as that of the Javan species, though not extending into Bengal; but it has been found in Assam, Chittagong, Burmah, the Malay Peninsula, Sumatra, and Borneo. It is possible that more than one species have been confounded under this designation, as two animals now living in the London Zoological Gardens present considerable differences of form and colour. One of them, from Chittagong, has been named by Sclater *R. lasiotis*, the Hairy-Eared Rhinoceros, but until an opportunity is afforded for anatomical examination, it is difficult to pronounce upon the value of the distinction.

III. *Atelodus*. In the adults, the incisors are quite rudimentary or entirely wanting. Nasal bones thick, rounded and truncated in front. Well-developed anterior and posterior horns in close contact. Skin without any definite permanent folds.

The two well-marked existing species are peculiar to the African continent.

1. The common Two-Horned Rhinoceros, *R. bicornis*, Linn., is the smaller of the two, with a pointed prehensile upper lip, and a narrow compressed deep symphysis of the

FIG. 4.—Common African Rhinoceros (*Rhinoceros bicornis*).

lower jaw. It ranges through the wooded and watered districts of Africa, from Abyssinia in the north to the Cape Colony, but its numbers are yearly diminishing, owing to

the inroads of European civilization, and especially of English sportsmen. It feeds exclusively upon leaves and branches of bushes and small trees, and chiefly frequents the sides of wood-clad rugged hills. Specimens in which the posterior horn has attained a length as great as or greater than the anterior have been separated under the name of *R. keilloa*, but the characters of these appendages are too variable to found specific distinctions upon. The two-horned African rhinoceros is far more rarely seen in menageries in Europe than either of the three Indian species, but one has lived in the gardens of the London Zoological Society since 1868. Excellent figures from life of this and the other species are published in the ninth volume of the *Transactions* of the society, from which the accompanying woodcuts are reduced.

2. Burchell's or the Square-Mouthed Rhinoceros (*R. simus*), sometimes called the White Rhinoceros, though the colour (dark-slate) is not materially different from that of the last species, is the largest of the whole group, and differs from all the others in having a square truncated upper lip and a wide, shallow, spatulate symphysis to the lower jaw. In conformity with the structure of the mouth, this species lives entirely by browsing on grass, and is therefore more partial to open countries or districts where there are broad grassy valleys between the tracts of bush. It is only found in Africa south of the Zambesi, and of late years has become extremely scarce, owing to the persecutions of sportsmen; indeed, the time of its complete extinction cannot be far off. No specimen of this species has ever been brought alive to Europe. Mr F. C. Selous gives the following description of its habits from extensive personal observation:—

"The square-mouthed rhinoceros is a huge ungainly-looking beast, with a disproportionately large head, a large male standing 6 feet 6 inches at the shoulder. Like elephants and buffaloes they lie asleep during the heat of the day, and feed during the night and in the cool hours of early morning and evening. Their sight is very bad; but they are quick of hearing, and their scent is very keen; they are, too, often accompanied by rhinoceros birds, which, by running about their heads, flapping their wings, and screeching at the same time, frequently give them notice of the approach of danger. When disturbed they go off at a swift trot, which soon leaves all pursuit from a man on foot far behind; but if chased by a horseman they break into a gallop, which they can keep up for some distance. However, although they run very swiftly, when their size and heavy build is considered, they are no match for an average good horse. They are, as a rule, very easy to shoot on horseback, as, if one gallops a little in front of and on one side of them, they will hold their course, and come sailing past, offering a magnificent broadside shot, while under similar circumstances a prehensile-lipped rhinoceros will usually swerve away in such a manner as only to present his hind-quarters for a shot. When either walking or running, the square-mouthed rhinoceros holds its head very low, its nose nearly touching the ground. When a small calf accompanies its mother, it always runs in front and she appears to guide it by holding the point of her horn upon the little animal's rump; and it is perfectly wonderful to note how in all sudden changes of pace, from a trot to a gallop or *vice versa*, the same position is always exactly maintained. During the autumn and winter months (*i.e.*, from March to August) the square-mouthed rhinoceros is usually very fat; and its meat is then most excellent, being something like beef, but yet having a peculiar flavour of its own. The part in greatest favour among hunters is the hump, which, if cut off whole and roasted just as it is in the skin, in a hole dug in the ground, would, I think, be difficult to match either for juiciness or flavour."—*Proc. Zool. Soc.*, 1881, p. 726

Extinct Species of Rhinoceros.—The family once contained many more species, which were far more widely distributed than at present. As in similar cases, our knowledge of them is as yet but fragmentary, though constantly augmenting, especially by discoveries made in the Tertiary deposits of North America, a region in which they all died out long ago, though, judging from the evidence at present available, this was the locality in which they first made their appearance. In the Eocene formations of the Rocky Mountains are found the remains of numerous modifications of the primitive Perissodactyle type, from which the rhinoceroses may have originated. In the Lower Miocene a form called *Hyrcodon* by Leidy already presented many of the

characteristics of the family, though, especially as regards the dentition, in a very generalized condition. The next stage of specialization is represented by *Aceratherium*, found in the Miocene of both Europe and America, which still, like the last, shows no sign of having possessed a nasal horn. It differed from the existing species also in having four toes on the anterior limb, instead of only three. At the same period forms occurred (*Dicraetherium*, Marsh) which show a pair of lateral tubercles on the nasal bones, apparently supporting horns side by side. These, however, soon disappeared and gave way in the Old World to species with one or two horns in the median line, a stage of development which apparently was never reached in America. In the Pliocene and Pleistocene of Europe and Asia numerous modifications of the existing types have been found. The present African two-horned type was represented in the Early Pliocene of Greece by *R. pachygnathus*, the skeleton of which is described by Gaudry as intermediate between the existing *R. bicornis* and *R. simus*. As many as three species were inhabitants of the British Isles, of which the best known is the Tichorhine or Woolly Rhinoceros, *R. antiquitatis* of Blumenbach, nearly whole carcasses of which, with the thick woolly external covering, have been discovered associated with those of the mammoth, preserved in the frozen soil of the north of Siberia, and which, in common with some other extinct species, had a solid median wall of bone supporting the nasals, from which it is inferred that the horns were of a size and weight surpassing that of the modern species. The one-horned Indian type was well represented under several modifications (*R. sivalensis*, *paleindicus*, &c.), in the Pliocene deposits of the sub-Himalayan region, and forms more allied to the African bicorn species have also been found in India. *R. schleimacheri* of the late European Miocene was in some respects allied to the existing Sumatran rhinoceros, possessing incisor teeth and two horns. (W. H. F.)

RHODE ISLAND, one of the six New England States, Plate IV. and the smallest in extent of all the States, is one of the original thirteen which formed the American Union. It has an actual land area of only 1054.6 square miles, the waters of Narragansett Bay, its chief physical feature, comprising an additional area of not far from 360 square miles. It lies between 41° 18' and 42° 3' N. lat., and 71° 6' and 71° 55' W. long., its greatest length from north to south being about 48 miles, and its greatest width from east to west about 35 miles. It is shut in on the east and north by Massachusetts, and on the west by Connecticut, while its southern shores are washed by the Atlantic Ocean.

Physical Characteristics.—The geological formation of the western portion of the State is chiefly that of the Montalban gneiss, which characterizes a great part of southern New England (see geological sketch map of New England, in article NEW HAMPSHIRE, vol. xvii. p. 391), but under the bay and to the east of it is an extensive coal-bearing formation, from which at different times upwards of 750,000 tons of coal have been taken. The only other important deposit is one of magnetic oxide of iron. The climate of Rhode Island, though variable, differs from that of the exposed coast of Massachusetts Bay in the absence of harassing east winds; while the proximity of the southern parts of the State (Newport and vicinity) to the Gulf Stream results in an atmosphere of unusual warmth and moisture, and at the same time comparatively equable. No great extremes, either of heat or of cold, are experienced in the State.

Population.—The earliest authentic estimate of population is that of 7181 in 1708. The War of Independence (1775–83) had the effect of reducing it from 59,707 in 1774 to 52,347 in 1782. The subsequent United States censuses show steady gains, as follows:—1790, 68,825; 1800, 69,122; 1810, 77,031; 1820, 83,059; 1830, 97,210; 1840, 108,830; 1850, 147,545; 1860, 174,620; 1870, 217,353; 1880, 276,531 (143,501 males, 133,030 females); while a State census in 1885 (advance returns) gives 304,419. The census of 1880 showed Rhode Island to be surpassed in aggregate population by all except Colorado, Oregon, Delaware, and Nevada, but in density it was surpassed by none (254.9 per square mile, the average for the whole United States being 13.92). By the same census the number of persons of foreign birth was 73,993, or 26.8 per cent., no State east of Lake Michigan showing

¹ The town of New Shoreham, which lies on an island 10 miles from shore, is beyond this limit.

a higher percentage; of these 30,973 (over 41 per cent.) were natives of the United Kingdom or its colonies. About 100,000 of the population are Roman Catholics; of the remainder, the Baptists (who have been in Rhode Island from its earliest settlement) are most numerous, while the communicants of the Protestant Episcopal church, with the Congregationalists and Methodists, have also a large representation.

Industries.—No portion of the State can be described as exceptionally fertile; and only 3 per cent. of the population are engaged in agriculture. The favourable situation of Newport and Providence, at the two extremities of Narragansett Bay, led to the development in the last century of a flourishing trade. This was long ago greatly reduced, and the tonnage of these ports is now chiefly that of a coasting trade. With the final check given to foreign commerce in the war of 1812-14, manufactures gained at once that prominence in the local industries of the State which they have ever since held. The census of 1880 returned the total number of persons in Rhode Island engaged in "gainful and reputable" occupations as 116,979, of whom 66,160, or more than 55 per cent., were classed under the heading "manufactures, mechanics, and mining."¹ From Samuel Slater's efforts at Providence and Pawtucket Falls, in 1790-93, may in fact be dated the real development of the cotton manufacturing industry in America. Slater, who had served an apprenticeship in England with a partner of Arkwright, having then been able from memory to set up in Rhode Island the whole set of recently improved spinning machinery. In 1791 only 5858 yards of cotton cloth were made in Providence and vicinity, but in 1810 in Rhode Island 735,319 were made. Two years later, in 1812, there were fifty-three cotton mills within a radius of 30 miles of Providence, nearly three-fifths of them being in Rhode Island. The number of cotton mills in Rhode Island was 33 in 1812, 116 in 1831, and 139 in 1870. Owing to the widespread depression in business the number was greatly reduced throughout the country during the next decade, but even in 1880 the number in Rhode Island was surpassed by that of no other State except Massachusetts. According to the census of 1880, the amount of capital invested in the manufacture of cotton goods was \$24,609,461; woollen goods \$15,410,450; dyeing and finishing textiles, \$6,874,254; foundry and machine-shop products, \$6,281,707; worsted goods, \$6,177,754; jewellery, \$5,650,133; slaughtering and meat-packing, \$3,876,740; mixed textiles, \$2,718,822; rubber and elastic goods, \$2,217,000. Thus Rhode Island is second to but one other State—Massachusetts—in its aggregate production of cotton goods; and in the total amount of capital invested in all manufactures it ranks ninth. In each of the five following industries—cotton, woollen, worsted, mixed textiles, and dyeing and finishing—it stands at the head of all the States in amount of production per head of population. In jewellery the yearly product of a single city, Providence, exceeds that of every other city in the country (\$5,444,092 in 1880). The same city ranks ninth in the value of its foundry and machine-shop products, \$4,522,179; Pawtucket, closely adjoining, adds about \$1,600,000.

Wealth and Finances.—The assessed valuation of the State was—in 1850, \$80,508,794; in 1860, \$135,337,588; in 1870, \$296,965,646; and in 1880, upwards of \$420,000,000—a gain of 500 per cent. in thirty years. In aggregate valuation it was surpassed in 1880 by twenty-four States (its population in the same year being exceeded by that of thirty-two States), but in valuation per head it ranked third (\$1518.82 in 1880). Notwithstanding the large foreign-born population, the number of persons classed as paupers is very small,—only 553 in 1880, as compared with 15,217 in New York. In 1884 thirty-eight savings banks contained deposits to the amount of \$51,079,160.66, with 115,752 depositors (more than 40 per cent. of the entire population). The number of other banks in the State was, in 1883, seventy-three, with a capital of \$22,330,579.00. The State tax in 1880 amounted to \$383,439.23; and in the same year the rate of taxation per head for all purposes (\$9.74) was exceeded only by that of Massachusetts, New York, and California. The debt of the State, held in bonds issued during the war of 1861-65, has for the last few years been steadily diminishing. In 1880 it stood at \$2,534,500, and in 1884 at \$1,342,000.

Cities and Towns.—The five counties into which Rhode Island is divided contain in all thirty-six towns and cities, of which six lie on the narrow strip bordering the eastern shore of the bay, five on islands in the bay and ocean, and the remaining twenty-five on the mainland, to the west and north-west of the bay. By the State census of 1885 six cities and towns had a population exceeding 10,000:—Providence, 117,607; Pawtucket, 22,873; Newport, 20,339; Lincoln, 17,262; Woonsocket, 16,005; Warwick, 13,281. Only two of these places, Providence and Newport, have hitherto been organized as cities; but a third, Pawtucket (the largest in the country under a town government), is also now (1885) about to be organized under a city charter. The quaint old city of Newport, situated at the southern end of the island (Rhode

Island) from which the State receives its name,² has for many years been nearly stationary as regards the development of its population and industries, but is well known on both sides of the Atlantic for its social attractions. In 1880 the "urban" population of Rhode Island constituted 77 per cent. of the total—a percentage surpassed only in the District of Columbia. Yet the growth of manufacturing industries in the State has resulted in building up compact settlements (in not a few instances almost continuous), with little regard to town lines and boundaries. On the Blackstone river are sixteen of these "villages" situated within five different towns; on the Woonasquattuck river twelve, in four cities and towns; and on the Pawtuxet river and its branches thirty-two, in five towns. In 1875 there were 186 "villages."

Education.—It was not until 1828 that the present public school system was established; but, owing largely to the exceptional organizing ability of the first commissioner of public schools, Henry Barnard, a most efficient system was securely built up. From various causes (including the presence of a large foreign-born element), illiteracy is a serious problem in this State,—the percentage unable to write (11.2) being in 1880 higher than in any other Northern State. Imperfect attendance is also a serious difficulty in the manufacturing villages. While the number of children registered by the school census of 1880 as of "school age" was 52,273, only 33,504 of these were actually enrolled as pupils in the public schools. Even after counting those who attend private and parochial schools, those "not attending any school" comprise so large a number as 12,279. Under the operation of a newly enacted compulsory law encouraging progress has been made. The public school funds in 1884 amounted to \$659,585.50. Educational institutions, other than public, include Brown University, the Friends' School, and various others at Providence. Brown University was founded in 1764, under the name of Rhode Island College, and was the seventh college established in America.

Libraries.—The Redwood Library, at Newport, still in existence, incorporated in 1747, was the fourth public library founded in New England. The Providence Library was founded only a few years later, and is still perpetuated in the Providence Athenæum, an admirably conducted shareholders' library (43,656 volumes in 1884). The Brown University Library, founded 1772, had in June 1885 more than 62,000 volumes, including several special collections of great rarity and value. There were, moreover, in the same year thirty-two "public libraries" in the State (free to all readers), with a total of about 100,000 volumes. The largest of these (31,650 volumes in 1885) is the Providence Public Library.

History and Constitution.—The planting of the three scattered and independent settlements (Providence, 1636; Portsmouth, 1638; Newport, 1639) by Roger Williams and others whose views of church polity and doctrine had been found unpalatable to the Massachusetts Puritans, was not in the outset a movement for the establishment of a colony. The need of mutual protection, however, led to their combination; and the first general union of these three towns (together with a fourth, Warwick), was secured in 1647, under the charter of March 14, 1643-44. The union effected by this instrument was of the very loosest description, but under the pressure of causes which threatened the very existence of the colony a new and much more comprehensive charter was obtained in 1663. This extraordinarily liberal instrument constituted the fundamental law of Rhode Island for the next hundred and eighty years, through a succession of remarkable vicissitudes. The charters of Massachusetts and other American colonies were withdrawn in 1686, but the efforts of the royal agent were frustrated in Connecticut and Rhode Island; and in this colony the government was simply committed temporarily to the separate towns which had constituted the colony, the charter government being peacefully resumed three years later, in 1689. Rhode Island was hardly free, during the next seventy years, from some form of conflict with the mother country over the question of charter rights; and in the steps which served to precipitate the War of Independence (1775-83), as well as in the war itself, it was among the foremost. In the military operations of this war Nathanael Greene, a Rhode Island officer, ranks easily second to Washington in generalship. Reluctant as Rhode Island was to acknowledge other authority than that of its own colonial charter, even after the close of the war, it did not accede to the constitution of the United States until June 1790, more than a twelvemonth after the new government had gone into operation under Washington as president. Nor did it even then follow the example of the other States in framing a State constitution for the government of its local affairs, but retained its colonial charter of 1663 until almost the middle of the present century. In 1841 and 1842 the dissatisfaction with this mode of government culminated in a series of revolutionary movements; and a convention called by citizens of the State adopted what was known as the "people's

¹ Mining has long been unrepresented among Rhode Island industries.

² The official name of the State is "the State of Rhode Island and Providence Plantations."

constitution," under whose provisions it was claimed that Thomas Wilson Dorr was chosen governor. Later in the year 1842 a convention called by the regularly constituted authorities adopted the present constitution, under whose provisions the State government was organized in 1843. The governor (chosen annually) has no veto power. The legislative body, known as the General Assembly, comprises a senate and a house of representatives, each one of the thirty-six cities and towns choosing a single senator. The General Assembly begins its annual sessions in May at Newport, adjourning, after a few days, for a much more extended session at Providence beginning in the following January. The judicial body consists of one supreme court, with subordinate courts for the respective counties, the justices being chosen by vote of the General Assembly. The suffrage is a limited one, a property qualification being required in certain instances. The State is represented in the national Congress by two senators and two representatives. In the quadrennial election of president, Rhode Island has four votes in the "electoral college." In the Civil War of 1861-65 Rhode Island took an active part, furnishing for the defence of the Union 24,042 men. (W. E. F.)

RHODES, an island in the *Ægean* Sea, belonging to the Turkish empire, lying off the south-west coast of Asia Minor, between 35° 52' and 36° 28' N. lat. and 27° 40' and 28° 15' E. long., about 10 miles south of Cape Alepo. Its length is about 45 miles from north-east to south-west, its greatest breadth 22 miles, and its area nearly 424 square miles.

The island is diversified in its surface, and is traversed from north to south by an elevated mountain range, the highest point of which, named in ancient times Atabyris or Atabyrium, and still called Atairo, rises to an elevation of 4560 feet. It commands a view of the elevated coast of Asia Minor towards the north, and of the Archipelago, studded with its numerous islands, on the north-west; while on the south-west is seen Mount Ida in Crete, often veiled in clouds, and on the south and south-east the vast expanse of waters which wash the African shore. The rest of the island is occupied in great part by ranges of moderately elevated hills, on which are found extensive woods of ancient pines, planted by the hand of nature. These forests were formerly very thick, but they are now greatly thinned by the Turks, who cut them down and take no care to plant others in their place. Beneath these hills the surface of the island falls lower, and several hills in the form of amphitheatres extend their bases as far as the sea.

Rhodes was famed in ancient times for its delightful climate, and it still maintains its former reputation. The air is pure and salubrious, and it is said that there is hardly a day throughout the year in which the sun is not visible. The winds are liable to little variation; they blow from the west, often with great violence, for nine months in the year, and at other times from the north; and they moderate the summer heats, which are chiefly felt during the months of July and August, when the hot winds blow from the coast of Anatolia.

Rhodes, in addition to its fine climate, is blessed with a fertile soil, and produces a variety of the finest fruits and vegetables. Numerous streams and rivulets, which take their rise in the central range, water the surrounding plains and valleys of the island. The inhabitants have a great taste for gardens; and around the villages are extensive cultivated fields and orchards, containing fig, pomegranate, and orange trees. On the sloping hills carob-trees, and others both useful and agreeable, still grow abundantly; the vine also holds its place, and produces a species of wine which was highly valued by the ancients, though it seems to have degenerated greatly in modern times. The valleys afford rich pastures, and the plains produce every species of grain; the wheat is of an excellent quality; and, but for the extortions of its barbarian rulers, the island might be the seat of agriculture as well as commerce, and might export large quantities of corn.

The commerce of the island has been of late years increasing at a rapid rate. Many British manufactures are imported by indirect routes, through Smyrna, Constantinople, Beyrout, and other places. Cotton stuffs, calicoes, and grey linen are among the goods most in demand. It is not so much, however, the peasantry of the island who use these British goods, for they prefer their own home-made stuffs; but they are exported to the neighbouring coast of Anatolia, between Budrum and Adalia, and thence conveyed into the interior. The expansion of the trade has been very much owing to the establishment of steam navigation direct to the island, which is now visited regularly by French and Austrian steamers, as well as by some from England to Smyrna.

The only town of any importance in the island is the capital, Rhodes, which stands at the north-east extremity. It rises in an imposing manner from the sea, on a gentle slope in the form of an amphitheatre. It is surrounded with walls and towers, and defended by a large moated castle of great strength. These fortifications are all the work of the Knights of St John. Above them rise the domes and minarets of the mosques, and the tufted stems of the palm trees, which adorn this like most other Oriental towns. The interior of the city does not correspond to its outward appearance. No trace exists of the splendour of the ancient city, with its regular streets, well-ordered plan, and numerous public buildings. The modern city of Rhodes is in general the work of the Knights of St John, and has altogether a mediæval aspect, the streets being for the most part narrow and winding, though the houses, as well as the public edifices, are in general solidly built of stone, and present at almost every step some memorial of the past in the escutcheons and coats of arms with which they are adorned. The picturesque fortifications also by which the city is surrounded remain almost unaltered as they were in the 15th century, and it has been remarked by numerous travellers that scarcely any city of western Europe has preserved its mediæval aspect so unchanged as this last refuge of European civilization in the East. The principal buildings which remain are the church of St John, which is become the principal mosque; the hospital, whence the charity of the knights was liberally dispensed to the faithful from all quarters of the world, and which has been transformed into public granaries; the palace of the grand master, now the residence of the pasha; and the senate-house, which still contains some marbles and ancient columns. Of the streets, the best and widest is a long street which is still called the Street of the Knights. It is perfectly straight, and formed of old houses, on which remain the armorial bearings of the members of the order. On some of these buildings are still seen the arms of the popes and of some of the royal and noble houses of Europe.

The only relics of classical antiquity are the numerous inscribed altars and bases of statues, as well as architectural fragments, which are found scattered in the courtyards and gardens of the houses in the extensive suburbs which now surround the town, the whole of which were comprised within the limits of the ancient city. The foundations also of the moles that separate the harbours are of Hellenic work, though the existing moles were erected by the Knights of St John.

Rhodes has at present two harbours. The least of these lies towards the east, and its entrance is obstructed by a barrier of rocks, so as to admit the entrance of but one ship at a time. It is sufficiently sheltered, but by the negligence of the Turks the sand has been suffered to accumulate until it has been gradually almost choked up. The other harbour is larger, and also in a bad condition; here frigates of thirty guns may anchor, and are sheltered from the west

winds, though they are exposed to the north and north-east winds. The two harbours are separated by a mole which runs obliquely into the sea. At the eastern entrance is the fort of St Elmo, with a lighthouse; but the light is very feeble, and visible only a few miles.

History.—The numerous poetical legends current among the Greeks with respect to Rhodes bear testimony to the importance which it attained in very early times. Of these the most familiar is that celebrated by Pindar in one of the most beautiful of his odes (*Ol. vii.*), according to which the island was raised from the depths of the sea by Helios, the god of the sun, who always continued to be its tutelary deity, and whose image is found upon all its coins. The poet as usual derives its name from a nymph Rhoda, but there is no doubt that it was really derived from *ῥόδον*, a rose, the symbol that invariably accompanies the head of Helios on its coins. Another set of legends connected it with the Telchines, a mythical people celebrated for their skill as workers in bronze and other metals, while another version of the same tale represented these Telchines as themselves expelled by the Heliade, who became the first introducers of civilization. It is not improbable that both traditions had some reference to the Phœnicians, who may well have been the first to establish settlements in an island that lay so directly on their way to the *Ægean*. But the first record that can claim anything like an historical character is that of the occupation of the island by a body of Doric emigrants from the Peloponnesus, who founded the three cities of Lindus, Ialysus, and Camirus, which long continued to divide the island among them, and together with those of Cos, Cnidus, and Halicarnassus formed the Doric Hexapolis or league of six cities. These cities, like the more important Ionic confederacy, had a common sanctuary on the Triopian Promontory near Cnidus, but they do not appear to have formed a political union, though the distinct predominance in them all of the Doric element would naturally lead to a community of interest as well as of feeling. Nothing is known of their history for several centuries, during which they appear to have developed a remarkable amount of maritime power and enterprise, and became the founders of numerous colonies in distant parts of the Mediterranean, including Gela in Sicily, as well as Rhoda on the coast of Spain, and Salapia on the Adriatic coast of Italy. Towards the east also they were the recognized founders of Corydalla and Phaselis in Lycia and Soli in Cilicia.

Notwithstanding these evidences of early prosperity and power, we meet with very scanty notices of the Rhodian cities in the first period of Greek history. After the Persian War they appear to have passed into the condition of tributaries to Athens, and were compelled as such to join in the Athenian expedition to Sicily, but in 412 B.C. they deserted the Athenian cause and joined that of the Peloponnesians. It was shortly after this (in 408) that they adopted a resolution which became the foundation of their future greatness, the inhabitants of the three cities having agreed to abandon their homes and found a new city on the site which has ever since continued to be the capital of the island.

The architect was Hippodamus of Miletus, who had planned and embellished the Piræus at Athens; and the new city soon became one of the most splendid in the world, adorned with magnificent buildings and exquisite works of art. When Conon and his fleet restored the Athenian power by his victory off Cnidus (394 B.C.), Rhodes again embraced the victorious cause; but her fidelity during the subsequent contests was not very great. Sparta afterwards received the allegiance of the island; and in the Social War (357–5) it joined the alliance against Athens, and, with the assistance of the Carian monarch Mausolus, succeeded in achieving independence. But, finding the power of that king dangerous to their liberties, the Rhodians once more sued for the Athenian protection, which they obtained through the eloquence of Demosthenes. But neither they nor the rest of Greece could resist the overwhelming power of Macedonia, though Memnon, a Rhodian, was one of the ablest generals under the last Persian king, and attempted to check the career of Alexander. Rhodes received a Macedonian garrison; but it was expelled after the death of Alexander, and a resolute resistance was begun to the Macedonian power. This formed one of the most illustrious periods in the history of the island. The capital was besieged in 304 B.C. by Demetrius Poliorcetes, with a large army and a complete train of the artillery of that age. Although a breach was effected in the walls, the desperate valour of the defenders foiled all the attempts to carry it by assault, and cost the besiegers the lives of some of their generals and a great number of their soldiers. This heroic resistance obtained for the Rhodians great renown; and the period which followed was one of the most brilliant in the history of the city. They enjoyed the friendship of Rome, and obtained possession of some of the adjacent islands and coasts, including a considerable district on the mainland which was known as the Rhodian Peræa. For arts as well as arms the island was then renowned; the Rhodian laws, especially on maritime affairs, were reckoned the best in antiquity, and

many of them adopted into the Roman code. *Æschines*, who had contended in eloquence with the greatest of orators, opened a school of rhetoric here, which became the parent of a new school of oratory, regarded by the ancients as possessing a Græco-Asiatic character. Protogenes embellished the city with his paintings, and Chares of Lindus with the celebrated colossal statue. The Colossus, erroneously supposed to have occupied a position striding over the entrance to the harbour, stood for fifty-six years, till an earthquake prostrated it in 224 B.C. Its enormous fragments continued to excite wonder in the time of Pliny, and were not removed till 656 A.D., when Rhodes was conquered by the Saracens, who sold the remains for old metal to a dealer who employed nine hundred camels to carry them away. Besides this not less than three thousand statues are said to have adorned the city, which was said by Strabo to surpass all others in beauty and ornamental character. Being the sovereigns of the seas, the Rhodians by their fleets rendered good service to Rome, with whom they were in alliance, and retained their independence for a long time. The severest blow they suffered was from Cassius in 42 B.C., who plundered the island even to the bare temple walls in the nominal cause of liberty, for it had embraced the side of Cæsar. Under the empire the liberty of Rhodes was repeatedly permitted and withdrawn according to the caprice of the sovereign; but ultimately it became a part of the Roman empire, and, after its partition, of the Eastern, till 616 A.D., when Chosroes the Persian obtained possession of it for a short time. It was subsequently conquered by Moawiyah, one of Othman's generals; but, recovered by the Byzantine empire, it proved the last of their Asiatic possessions that succumbed to the infidel. In 1308 it was granted by the emperor Emmanuel to the Knights of St John, who soon after resisted a siege by the sultan Othman. They strengthened the natural advantages of the place by skilful fortifications, and by discipline and equipments made themselves nearly a match for the superior numbers of the Turks. Nor did the knights restrict their efforts to self-defence; they conquered Smyrna, and established an outpost there in 1344, and at a later period formed a league against the common enemy of Christendom. But in 1401 Smyrna was taken by Timur; in 1480 Mohammed II. besieged Rhodes with a vast train of artillery; and, though then averted by the courage of its few defenders, the downfall of the place could not long be delayed. The last and most famous siege of Rhodes took place in 1522, when, after a desperate resistance for four months to the overwhelming numbers of the Ottomans, the knights, being left unassisted by all the European powers, capitulated on honourable terms, and evacuated the island. On the first day of 1523 Villiers de Lisle Adam, the grandmaster, embarked the last of the small band, carrying away all the property of the order, and leaving the ruins of their city to the enemy. The knights subsequently settled in Malta, where they also gained great renown. Rhodes has since been in the possession of the Turks, and is now the residence of the pasha of the Archipelago. The sites of Lindus, Ialysus, and Camirus, which in the most ancient times were the principal towns of the island, are clearly marked, and the first of the three is still occupied by a small town with a mediæval castle, both of them dating from the time of the knights, though the castle occupies the site of the ancient acropolis, of the walls of which considerable remains are still visible. There are no ruins of any importance on the site of either Ialysus or Camirus, but excavations at the latter place have produced valuable and interesting results in the way of ancient vases and other antiquities, which are now in the British Museum.

The population of the island is estimated at about 27,000, of whom 6000 are Turks, 3000 Jews, and the remainder Greeks. Of these nearly 20,000 are contained in the city and its suburbs; the rest of the island is very thinly peopled, though numerous small villages are scattered over its whole extent.

A large mass of matter relating to the ancient history and institutions of Rhodes are collected by Meursius in his dissertation (*Opera*, vol. iii.); the present condition of the island, and the objects of interest still visible there, are fully described by Ross (*Reisen auf den Griechischen Inseln*, vol. iii., Stuttgart, 1840) and Newton (*Travels and Discoveries in the Levant*, vol. i., London, 1865). The inscriptions that have been discovered there, which are very numerous, have unfortunately been published in a very irregular manner, and are scattered through a number of works, many of them not easy of access. By far the most complete collection of all that relates to the ancient condition of the island, as well as its history and antiquities, will be found in a treatise by Mr C. Torr, entitled *Rhodes in Ancient Times*, which is passing through the Cambridge University Press while this article has been in preparation. (E. H. B.)

RHODIUM. See PLATINUM.

RHODODENDRON. Classical writers, such as Dioscorides and Pliny, seem, from what can be ascertained, to have called the oleander (*Nerium Oleander*) by this name, but in modern usage it is applied to a large genus of shrubs and trees belonging to the order of heaths (*Ericaceæ*). No adequate distinction can be drawn between this genus and *Azalea*,—the proposed marks of distinction, however applicable in particular cases, breaking down when tested more generally. The rhododendrons,

then, are trees or shrubs, never herbs, with simple, evergreen or deciduous leaves, and flowers in terminal clusters surrounded in the bud by bud-scales but not as a rule by true leaves. The flowers are remarkable for the frequent absence or reduced condition of the calyx. The funnel- or bell-shaped corolla, on the other hand, with its five or more lobes, is usually conspicuous, and in some species so much so as to render these plants greatly prized in gardens. The free stamens are usually ten, with slender filaments and anthers opening by pores at the top. The ovary is five- or many-celled, ripening into a long woody pod which splits from top to bottom by a number of valves, which break away from the central placenta and liberate a large number of small bran-like seeds provided with a membranous wing-like appendage at each end. The species are for the most part natives of the mountainous regions of the northern hemisphere, extending as far south as the Malay Archipelago and New Guinea, but not hitherto found in South America or Australia. None are natives of Britain. They vary greatly in stature, some of the alpine species being mere pigmies with minute leaves and tiny blossoms, while some of the Himalayan species are moderate sized trees with superb flowers. Some are epiphytal, growing on the branches of other trees, but not deriving their sustenance from them. The varieties grown in gardens are mostly derived from the Pontic species (*R. ponticum*) and the Virginian *R. catawbiense*. These are mostly hardy in England. The common Pontic variety is excellent for game-covert from its hardness, the shelter it affords, and the fact that hares and rabbits rarely eat it. Variety of colour has been infused by crossing or hybridizing the species first-named, or their derivatives, with some of the more gorgeously-coloured Indian varieties. In many instances this has been done without sacrifice of hardihood, but even where the infusion of Indian blood has brought about a tenderness of constitution the magnificence of the bloom amply repays the very slight shelter which is requisite in winter.

What are termed greenhouse rhododendrons are derivatives from certain Malayan and Javanese species, and are consequently much more tender. They are characterized by the possession of a cylindrical (not funnel-shaped) flower-tube and other marks of distinction. Azaleas now referred to *Rhododendron* are derived from Chinese and Japanese species chiefly. The "Indian" azaleas, so-called, have nearly evergreen foliage like a rhododendron, but with stiff hairs on the under surface of the leaf, and the flower-buds comprise leaves and not bud-scales only as in true rhododendrons. *Rhododendron* (*Azalea*) *indicum* is truly a native of China and Japan, but not of India. What are called in gardens Ghent azaleas are hardy varieties with deciduous gummy foliage and tufts of fragrant, brilliantly-coloured flowers. These are derivatives from *A. calendulacea*, *A. viscosa*, and other north-east American species. Another group of garden azaleas are derivatives from *Rhododendron* (*Azalea*) *sinense* (of which *R. mollis* is a form). These are scarcely less hardy than the preceding. *Azalea amena* of gardens is a dwarf form of *R. indicum*, remarkable for having "hose in hose" flowers, a state of things brought about by the fact that the calyx in this variety becomes petaloid like the corolla. The foliage of rhododendrons contains much tannin, and has been used medicinally. Whether the honey mentioned by Xenophon as poisonous was really derived from plants of this genus as alleged is still an open question.

RHONE (Fr. *Rhône*), the largest European river flowing directly into the Mediterranean, rises in the Swiss canton of Valais, passes through the Lake of Geneva, strikes across the line of the Jura, and turning southward through France falls into the Gulf of Lyons. It has a length of 447 miles according to Strelbitzky (505 according to other authorities), and its principal affluent the Saône has a length of 268 miles above the confluence, which is 200 miles inland. The drainage area of the whole river-system is 38,000 square miles, and the mean discharge at the river mouth is 60,000 cubic feet per second, the maximum being 428,840 cubic feet and the minimum 19,426.

The natives give the name of source of the Rhone (locally Rotten or Rodden) to three warm springs that rise in a circular stone basin near the Hôtel du Glacier du Rhône; but the real beginning of the river is the well-known glacier. According to M. Gosset,¹ a Swiss engineer, the Rhone glacier, which at present measures about 9 miles in length by about 3200 feet in width, is proved to have retreated 3028 feet between 1856 and 1881 and sunk upwards of 300 feet. In geological time the Rhone glacier filled the whole valley to a depth of 4800 feet and spread out over the Swiss plain now partly occupied by the Lake of Geneva. Obstructed by the Jura, it divided into two branches, one of which found its way (as the river does still) by the "écluse" between the Jura and the western Alps to deposit its erratic blocks on the heights in the neighbourhood of Lyons, while the other branch, bending northward, widened out so as to distribute its burden at Freiburg, Bern, Soleure, and even Aarburg.²

In the first 30 miles from the foot of the glacier (5751 feet) to Brieg (2214 feet) the stream has a fall of 1 in 46; in the next 70 miles to Villeneuve it descends at the rate of 1 in 378.³ It passes between the Bernese and the Pennine Alps, receiving the tribute of 260 glaciers, of which the Aletsch is one of the most important. At Martigny, where it is joined by the Drance (a glacier-fed stream memorable for the terrible inundation of 1818 caused by the sudden bursting of the ice barrier by which its waters had been dammed back), the Rhone turns suddenly north-west, and below the defile of St Maurice (about 90 miles from its source) it enters the wide alluvial plain formerly occupied by the south-eastern arm of the Lake of GENEVA (*q.v.*), which has now retreated about 12 miles northward. The limpid character of the Rhone water as it issues from the south-western end of this great settling vat has become a commonplace of geographical illustration, and equally well-known is the contrast afforded at the confluence about a mile below Geneva between the current of the main river and that of its turbulent affluent the Arve, which has found no resting place in its 2000 feet descent by a course of 60 miles from the valley of Chamouni and the glaciers of Mont Blanc. It is the Arve that is mainly responsible for the dangerous inundations of the Rhone valley farther down; while its volume is sometimes not more than 1235 per second,⁴ at other times it pours into the Rhone (whose maximum at this point is 2000 cubic feet) no less than 24,700 cubic feet, sometimes causing the river to flow backwards towards the Lake of Geneva.⁵ To obviate the evils of their irregularity it has been proposed to divert the lower course of the Arve into the Lake of Geneva. The annual maximum of the Rhone at Geneva, according to observations between 1806 and 1880, occurs on the 7th of August. Since 1862 there has been an increase of high levels owing to the dyking of the river and the destruction of forests (see Plantamour, "Obs. limnimétriques," in *Mém. de la Soc. de Genève*, 1880). The defile or "écluse" by which the Rhone passes between Grand Credo, the terminal bastion of the Jura, and Mont Vouache, one of the Alps of Savoy, is commanded by one of the great frontier fortresses of France,

¹ A sketch of M. Gosset's remarkable labours is given in the *Alpine Journal*, 1878-80.

² See Falsan and Chantre, *Monographie géologique des anciens glaciers et du terrain erratique de la partie moyenne du bassin du Rhône*, 1880. See also the map illustrating Auguste Jaccard's paper in *Bull. de la Soc. Vaudoise*, Feb. 1885.

³ A large-scale profile of the upper Rhone accompanies Gerlach's paper "Die Penninischen Alpen" in *Mém. de la Soc. Helv.*, 1869.

⁴ Professors Paul Chaux and Plantamour, on one occasion in March, found the volume of the Arve as low as 812 cubic feet per second, and that of the Rhone 1612.

⁵ See the annual *Observations hydrométriques suisses sur le bassin du Rhône* issued by the Bureau fédéral des travaux publics.

Fort de l'Écluse. About 5½ miles farther down occurs the famous Perte du Rhône, a partially subterranean passage, now considerably modified by blasting.

"The rocks forming the funnel come so close at one place that there is only a distance of about two feet from bank to bank, and a man of moderate height could stand with one foot on the French side and the other on the Savoy side and see between the beautiful river trembling as it were with rage and hastening to escape from the defile through which it is doomed to pass. A little way farther down the river has hollowed out a passage about 30 feet wide, which retains this width for a depth of from 30 to 35 feet, when it contracts considerably. At this depth a stratum of harder rock has resisted the action of the water, which, however, has scooped out beneath it almost as much as above it. Along each side of the ravine the harder rock projects for eight or ten feet like a cornice. At first the water is seen through the opening down the middle; but farther on great masses of rock from the walls of the ravine have fallen down, and, resting on the double cornice, conceal the river for a distance of some 60 paces."¹

During the summer floods the water filled the ravine far above the level of the fallen blocks, and the Perte du Rhône was no longer visible.² The rocks through which the "perte" is cut belong to the Urganian subdivision of the Cretaceous system,—the stratum which has been hollowed out being described as *calcaire gris*. Just below the ravine the Rhone is joined by the Valserine, which a little above Bellegarde passes through a "perte" of a similar character. Since 1871 the motive power of the main river has been utilized for the industries of Bellegarde; a large tunnel 20 feet high and more than half a kilometre long brings the water from the south side of the perte to turbine wheels placed in the bed of the Valserine, and wire ropes transmit the power to the Bellegarde workshops on the plateau 400 feet above.³ Below Bellegarde the river is deflected southwards by the western chain of the Jura. It receives from the left the Usse, the Fiar (which drains the lake of Annecy), and the emissary of the Lake of Bourget, the largest of the purely French lakes, and then at the junction of the Guiers (from the Grande Chartreuse) it turns north-west round the southern end of the Jura. The Ain (118 miles long), which joins it from the right, is navigable in the direction of the current, and in its upper waters has a "perte" of some interest. Farther down the main river meanders for a time with shifting channels in a bed about two miles broad, but it gathers into a single stream before its junction with the Saône. This important confluent (the ancient Arar, which according to Cæsar flows "incredibili lenitate") has its source at Vioménil in the Vosges 1300 feet above the sea, and has been joined by the Doubs, which, rising in the district between the Jura and the Vosges, is famous for the beauty of its upper gorges and for the waterfall (70 feet) known as the Saut du Doubs.⁴ Southwards from Lyons, where it is 530 feet above the sea, the united river continues to be still the "arrowy Rhone"; in the 61 miles from the Saône mouth to the Isère it falls 180 feet, in the 18 from the Isère to the Drome 56 feet, in the 38 from the Drome to the Ardèche 164, and in the 34 from the Ardèche to the Durance 88½. Those affluents, all except the last from the Savoy and Maritime Alps, are in general of little importance, but at times become formidable torrents. The same is true of the much shorter streams which bring down the waters from the eastern slopes of the Cevennes. During the inundation of the 10th September 1857, which has been frequently exceeded, the three streams the Doux,

the Érieux, and the Ardèche poured into the Rhone 49,000 cubic feet per second. At Fourques d'Arles, 25 miles from the sea, the river begins to form its delta, breaking up into two main branches, the Grand Rhône passing from Arles south-east towards the Gulf of Fos, and the Petit Rhône south-west towards the Little Camargue. With all its rapidity of current and mass of waters it is not able to keep a clear passage to the sea through its own alluvium, which, according to M. Reclus's estimate, has since the Gallo-Roman period added from 75 to 100 square miles to the area of its delta.

From the time that Marius caused his soldiers to excavate the Fossæ Marianæ which have left the name of Fos to the bay already mentioned the endeavour to maintain a navigable channel inland from the sea has perplexed successive generations. Vauban himself declared "Les embouchures du Rhône sont incorrigibles." The method of contracting and embanking a principal channel right out to sea failed, either because the embankments were not carried out far enough, or more probably because the tides of the Mediterranean are not sufficiently strong to aid in removing the alluvium. A canal constructed in 1802-1832 from Arles to Bouc (on the east side of the Gulf of Fos) proved too shallow for the new steam traffic. At length in 1863 a scheme brought forward by Hippolyte Peut in 1846 was adopted for the making of a canal, 11,480 feet long, 210 feet wide and 19½ feet deep at low tide, from Tour St Louis on the left bank of the Grand Rhône to the Anse de Repos in the Gulf of Fos. The canal was completed in 1871, and the quays of the port of St Louis by the close of 1873, at a cost of 26,000,000 francs. Hostile critics maintain that it will be possible to keep this channel open at the seaward end only by continual and costly dredging, but hitherto their fears seem exaggerated. The new port has been very successful, 1261 vessels (813,745 tons) entering in 1881 and 2317 vessels (448,757 tons) in 1882. The regulation of the river itself is still a problem. The rapidity of the current from Lyons downwards, the extremely shifting character of the channel, and the variations that take place in the volume of water are the great obstacles to be overcome. Two months of the year are lost for navigation through floods or lack of water or fogs or ice. At present (1885) a scheme combining the two systems of regularization and canalization is being carried out for the purpose of securing everywhere at low water a depth of 5 feet 3 inches.

In the beginning of the present century even passenger boats used to be hauled up the river by towing ropes, and when steam was introduced it was found that the vessels had to be specially constructed to make head against the current. The laying of a continuous chain all the way from Lyons to Arles is impracticable through the shifting character of the bed; but several methods have been adopted to overcome the difficulties of the ascent. Thus some boats advance by means of long jointed levers which catch into the ground. Or a steel wire cable with one of its ends fixed at a given spot is unwound as a steam tug descends the stream and then the tug with its convoy of boats makes its way up again by simply winding in. Or two tugs are employed, the first going in advance of the other so far that the cable which it pays out takes a sufficient hold of the bottom to enable the second to haul by it. Or, lastly, Dupuy de Lome's system is adopted, by which the boat grips the river bottom by means of two continuous chains perpetually sunk in front and emerging behind. The Saône is much more easily dealt with than the Rhone. It is navigable as far up as Port-sur-Saône, and a system of movable dams and sluices has been established to secure a depth of 6 to 7 feet at low water.

The basin of the Rhone communicates with the Loire by the Canal du Centre (joining the Saône at Chalons), with the Seine by the Burgundy Canal (joining the Saône at St Jean de Losne), with the Rhine by a canal (1783-1834) which passes from the Saône at Saint Symphorien to the Doubs, and finally ends at Strasburg, and with the Meuse and the Belgian system by a canal (Canal de l'Est) constructed since 1875 from the Saône to the Moselle.

See Boissel, *Voy. pitt. et navigation exécutée sur une partie du Rhône réputée non-navigable*, 1795, and works on the river by Hippolyte Peut (1846), Surell (1847), Desjardins (1866), Adrian German (1872), and De la Rochette. Also Lenthéric, *Les villes mortes du Golfe de Lyon*, 1875, and a paper in *Rev. des Deux Mondes*, 1880; Blerzy, *Torrents, fleuves, et canaux de la France*, 1878. (H. A. W.)

RHÔNE, a department of south-eastern France, deriving its name from the great river on which Lyons, its chief town, is situated, was formed in 1793 from the eastern portion of the department Rhône-et-Loire, comprising parts of Lyonnais and Beaujolais. It is bounded on the N. by Saône-et-Loire, on the E. by Ain and by Isère, on the S. and W. by Loire, and lies between 45° 27' and 46° 18' N. lat. and 4° 15' and 4° 53' E. long. The Saône and the Rhone, each for a distance of 26 miles, form its natural

⁴ See "La Saut du Doubs," in *Tour du Monde*, 1880.

boundary on the east. The department belongs almost entirely to the basin of the Rhone, to which it sends its waters by the Saône and its tributary the Azergues, and by the Gier. The watershed between the Rhone and the Loire rises to the west of the department, and from north to south forms four successive groups—the Beaujolais Mountains, the highest peak of which is 3320 feet; the Tarare group; the Lyonnais Mountains (nearly 3000 feet); and Mont Pilat, the highest peak of which belongs to the department of Loire. The lowest point of the department, where it is left by the Rhone, is 460 feet above the level of the sea. The meteorological conditions vary greatly with the elevation and exposure. Snow sometimes lies in the mountains from November to April, whilst at Lyons and in the valleys the mean temperature in winter is 36° Fahr., and in summer 70°, the annual mean being 53°. The average rainfall is somewhat higher than is general over France owing to the amount of the precipitation on the hilly region.

Of a total area of 689,545 acres, 286,000 are arable, 120,000 are pasture meadow land, 79,000 under vines, 79,000 wood, and 66,000 moorland. From 1874 to 1883 the average annual harvests yielded 253,869 quarters of wheat, 7509 of meslin, 114,468 of rye, 3035 of barley, and 98,803 of oats. In 1883 there were produced 5,390,000 bushels of potatoes, 106,650 bushels of buckwheat, 41,320 tons of beetroot, 12 of hemp seed, and 83 of hemp. Between 1874 and 1883 the average annual yield of the vines was 16,533,956 gallons of wine; in 1883 it was only 11,918,034. In 1881 the live stock numbered 12,350 horses, 2000 asses, 600 mules, 9000 oxen or bulls, 65,000 cows, 12,500 calves, 49,000 sheep (producing 110 tons of wool), 16,000 pigs, 36,000 goats, 8000 bee-hives (producing 48 tons of honey and 16 tons of wax); 78 cwts. of cocoons were produced in 1882, while in 1883 there were only 47 cwts. The soil of the department is for the most part stony and only moderately fertile. Fruit trees, such as peaches, apricots, walnuts, and chestnuts, grow well, but the wood in general is little more than copse and brushwood. The wealth of the department is mainly derived from its industries. Its transactions with the Bank of France at Lyons in 1882 amounted to £30,398,960—a figure only exceeded by the departments Seine and Nord. The population is principally engaged in the manufacture of chemicals, of machinery, and of silk. In 1881 324 factories, with 18,500 spindles, 700 power-looms, and 43,000 hand-looms, were employed in the spinning and weaving of silk; 58 works, with 35,800 hackling and reeling machines, in the preparation of the raw material; 7 works, with 450 spindles, 230 power-looms, and 1250 hand-looms, in the manufacture of mixed goods, and 800 looms in the manufacture of lace; 80 dyeworks employ 4000 workmen. In 1879 it was calculated that the turnover for silk articles amounted to £15,000,000 (£5,000,000 for labour and £10,000,000 for the raw material). LYONS (*q.v.*) is the centre for the silk manufacture and Tarare for that of muslins, velvets, plush, calicoes, and prints, there being 26 factories, with 33,000 spindles, 540 power-looms, 4800 hand-looms; 2000 workmen are also employed in the manufacture of counterpanes. In 1882 88,115 tons of iron were produced. The chief workshops for repairing the locomotives of the Paris, Lyons, and Mediterranean line are in this department. There are also foundries of copper, bronze, and bell-metal, as also gold, silver, and steel wire works. The manufacture of gold and silver plate and jewellery has an annual turnover of £320,000, that of edible pastes amounts to £480,000, and that of paper to £54,000. The manufacture of wall papers is only second to that of Paris. In addition there are 15 chemical works, 8 glass works employing 1000 workmen with a turnover of £190,000 in 1879, 9 candle works (£268,800), 12 soap works (£102,200), and 700 mills. In 1881 there were in the department 1448 industrial establishments, employing 1558 steam engines with an aggregate horse power of 13,077. Coal and anthracite are found (36,169 tons in 1882), as well as argentiferous lead, manganese, and copper pyrites; there are also large stone quarries. The cold mineral spring of Charbonnière, containing bicarbonates, iron, and sulphur, is 19 miles west of Lyons. The means of communication include 76 miles of navigable river, 5 of canal (the canal of Givors), 141 miles of Government road, 3685 miles of other roads, and 165 miles of railway connecting Lyons with Paris, with Roanne by Tarare, with Montbrison, St Etienne, Nîmes, Marseilles, Grenoble, Chambéry, Geneva, Bourg, and Trévoux, Beaujeu with Belleville (on the Lyons and Mâcon line), and Thizy with Cours (two manufacturing towns in the neighbourhood of Tarare on the line from Lyons to Roanne). The population, which owing to the development of industries has doubled since 1801, was 741,470 in 1881—266 per square kilometre, the average in France being 71. There are two arrondissements, Lyons

and Villefranche, 29 cantons, and 264 communes. Rhône belongs to the diocese of Lyons, is under the jurisdiction of the superior court of Lyons, and is divided between the corps d'armée of Clermont and of Grenoble. The chief towns are LYONS (*q.v.*); Tarare (13,352); Villeurbanne (11,176); Caluire-et-Cuire (9740) and Oullins (7536), suburbs of Lyons; Givors (11,470), a stirring town on the Rhone at the junction of the canal by which coal is brought from St Etienne to the Rhone, with glass works, blast furnaces, foundries, brick and tile works, and potteries; Amplepuis (7118); and Cours (6929).

RHUBARB. This name is applied both to a drug and to a vegetable.

1. The drug has been used in medicine from very early times, being described in the Chinese herbal *Pen-king*, which is believed to date from 2700 B.C. The name seems to be a corruption of *Rheum barbarum* or *Reu barbarum*, a designation applied to the drug as early as the middle of the 6th century, and apparently identical with the *ρῆον* or *pā* of Dioscorides, described by him as a root brought from beyond the Bosphorus. Rha is said by Ammianus Marcellinus to take its name from the river Rha (Volga), on the banks of which a species of *Rheum* (*R. Rhaponticum*) grows. It is not, however, known whether the root of this species was the article used under the name of *Rha ponticum* or *Rha barbarum*, or whether these names were applied to the drug brought overland from China by way of the Caspian Sea. It is, however, certain that in the early part of the 11th century Chinese rhubarb was distinguished as superior to the *Rha barbarum*. In the 14th century rhubarb appears to have found its way to Europe by way of the Indus and Persian Gulf to the Red Sea and Alexandria, and was therefore described as "East Indian" rhubarb. Some also came by way of Persia and the Caspian to Syria and Asia Minor, and reached Europe from the ports of Aleppo and Smyrna, and became known as "Turkey" rhubarb. Subsequently to the year 1653, when China first permitted Russia to trade on her frontiers, Chinese rhubarb reached Europe chiefly by way of Moscow; and in 1704 the rhubarb trade became a monopoly of the Russian Government, in consequence of which the term "Russian" or "crown" rhubarb came to be applied to it. Urga was the great depôt for the rhubarb trade in 1719, but in 1728 the depôt was transferred to Kiachta. All rhubarb brought to the depôt passed through the hands of the Government inspector, acting under the instructions of the Russian minister of war, and all pieces except those of good quality were rejected. Hence Russian rhubarb was invariably good and obtained a remarkably high price. This severe supervision naturally led, as soon as the northern Chinese ports were thrown open to European trade, to a new outlet being sought; and the increased demand for the drug at these ports resulted in less care being exercised by the Chinese in the collection and curing of the root, so that the rhubarb of good quality offered at Kiachta rapidly dwindled in quantity, and after 1860 Russian rhubarb ceased to appear in European commerce. The drug from that date became known as Chinese rhubarb, although the older names still continue in domestic use in England. Owing to the expense of carrying the drug across the whole breadth of Asia and the difficulty of preserving it from the attacks of insects, rhubarb was formerly one of the most costly of drugs. In 1542 it was sold in France for ten times the price of cinnamon and four times that of saffron, and in an English price list bearing date of 1657 it is quoted at 16s. per lb, opium being at that time only 6s. and scammony 12s. per lb.

Rhubarb is used in medicine as a mild purgative and cholagogue, promoting digestion and improving the appetite when given in small doses, probably by stimulating the intestinal secretions. It has a subsequent astringent effect due to the rheotannic acid it contains but this can

be counteracted by giving it with alkaline preparations. It is especially valuable in the treatment of duodenal catarrh or catarrh of the biliary ducts with jaundice; and in certain skin diseases it has proved to be a valuable medicine, the results obtained being probably due to the chrysophan contained in it.

The botanical source of Chinese rhubarb cannot be said to have been as yet definitely cleared up by actual identification of plants observed to be used for the purpose. *Rheum palmatum*, *R. officinale*, *R. palmatum* (var. *tanguticum*), *R. chinianum*, and *R. Franzosbachii* have been variously stated to be the source of it, but the roots produced by these species under cultivation in Europe do not present the characteristic network of white veins exhibited by the best specimens of the Chinese drug (see Goebel and Kunze, pt. ii., pl. i. figs. 2b, 3b).

Chemistry.—The chief chemical constituents of Chinese rhubarb are chrysophan ($C_{15}H_{10}O_4$), rheotannic acid ($C_{20}H_{26}O_{14}$), emodin ($C_{15}H_{10}O_6$), a neutral colourless crystalline substance having the formula $C_{10}H_{12}O_4$, a white and a dark brown crystalline resin; it also contains mucilage in the proportion of 11 to 17 per cent., and a considerable quantity of oxalate of lime. An albuminoid principle containing nitrogen and sulphur is also found in the root, which, in the presence of water, as recently shown by Kubli,¹ decomposes the chrysophan into chrysophanic acid and glucose, and apparently exerts a similar action on rheotannic acid, giving rise to the formation of rheumatic acid ($C_{20}H_{16}O_9$) and a fermentable sugar. Rheumatic acid is a reddish-brown powder, sparingly soluble in cold water. The albuminoid principle is insoluble in rectified spirit of wine; consequently a preparation of the root made with that menstruum contains the active principles of the drug in the natural state, whilst an aqueous extract contains them in an altered condition.

Production and Commerce.—Rhubarb is produced in the four northern provinces of China proper (Chih-li, Shan-se, Shen-se, and Ho-nan), in the north-west provinces of Kan-suh formerly included in Shen-se, but now extending across the desert of Gobi to the frontier of Tibet, in the Mongolian province of Tsing-hai, including the salt lake Koko-nor, and the districts of Tangut, Sifan, and Turfan, and in the mountains of the western provinces of Sze-chuen. According to Richthofen the best rhubarb is collected exclusively from wild plants in the high mountains of western Sze-chuen between the sources of the Hoang-ho and the rivers Ya-lung Keang and Min-keang, and comes into trade under the name of Shen-se rhubarb.² Two of the most important centres of the trade are Sining-fu in the province of Kan-suh and Kwan-hien in Sze-chuen. From Shen-se, Kan-suh, and Sze-chuen the rhubarb is forwarded to Hankow, and thence carried to Shanghai, whence it is shipped to Europe. Lesser quantities are shipped from Tien-tsin, and occasionally the drug is exported from Canton, Amoy, Fuh-chow, and Ning-po.

Very little is known concerning the mode of preparing the drug for the market. According to Mr Bell, who on a journey from St Petersburg to Peking had the opportunity of observing the plant in a growing state, the root is not considered to be mature until it is six years old. It is then dug up, usually in the autumn, and deprived of its cortical portion and smaller branches, and the larger pieces are divided in half longitudinally; these pieces are bored with holes and strung up on cords to dry, in some cases being previously subjected to a preliminary drying on stone slabs heated by fire underneath. In Bhutan the root is said to be hung up in a kind of drying room, in which a moderate heat is regularly maintained. The effect produced by the two drying processes is very different; when dried by artificial heat, the exterior of the pieces becomes hardened before the interior has entirely lost its moisture, and consequently the pieces decay in the centre, although the surface may show no change. These two varieties are technically known as kiln-dried and sun-dried; and it was on account of this difference in quality that the Russian officer at Kiachta had every piece examined by boring a hole to its centre. The best rhubarb occurs in pieces of a yellowish colour externally, more or less marked with a network of whitish veins, the surface being convex and smooth. Internally it presents no signs of decay, but is compact, marbled with reddish-brown and white, mixed sometimes with iron grey. The smaller cylindrical sections of the root which have not been divided longitudinally are technically known as "rounds," and have usually a hole with a piece of string left in it; the flat pieces are more rarely pierced. Inferior qualities are

shrunk and shrivelled on the surface, and externally of a brownish tint, showing traces of the darker bark, and when broken open are frequently decayed in the centre.

European Rhubarb.—As early as 1608 Prosper Alpinus of Padua cultivated as the true rhubarb a plant which is now known as *Rheum Rhaponticum*, L., a native of southern Siberia and the basin of the Volga. This plant was introduced into England through Sir Matthew Lister, physician to Charles I., who gave seed obtained by him in Italy to the botanist Parkinson. The culture of this rhubarb for the sake of the root was commenced in 1777 at Banbury in Oxfordshire, by an apothecary named Hayward, the plants being raised from seed sent from Russia in 1762, and with such success that the Society of Arts awarded him a silver medal in 1789 and a gold one in 1794. The cultivation subsequently extended to Somersetshire, Yorkshire, and Middlesex, but is now chiefly carried on at Banbury. English rhubarb root is sold at a cheaper rate than the Chinese rhubarb, and forms a considerable article of export to America, and is said to be used in Britain in the form of powder which is of a finer yellow colour than that of Chinese rhubarb. The Banbury rhubarb appears to be a hybrid between *R. Rhaponticum* and *R. undulatum*,—the root, according to E. Colin, not presenting the typical microscopic structure of the former. During the last few years very good rhubarb has been grown at Banbury from *Rheum officinale*, but these two varieties are not equal in medicinal strength to the Chinese article, yielding less extract,—Chinese rhubarb affording, according to H. Seier, 58 per cent., English rhubarb 21 per cent., and *R. officinale* 17 per cent. In France the cultivation of rhubarb was commenced in the latter half of the last century,—*R. compactum*, *R. palmatum*, *R. Rhaponticum*, and *R. undulatum*, L., being the species grown. The cultivation has, however, now nearly ceased, small quantities only being prepared at Avignon and a few other localities.

The culture of *Rheum compactum* was begun in Moravia in the beginning of the present century by Priky, an apothecary in Austerlitz, and until twenty-five or thirty years ago the root was largely exported to Lyons and Milan, where it was used for dyeing silk. As a medicine 5 parts are stated to be equal to 4 of Chinese rhubarb. Rhubarb root is also grown at Auspitz in Moravia and at Ilmitz, Kremnitz, and Frauenkirchen in Hungary; *R. Emodi* is said to be cultivated for the same purpose in Silesia.

The cultivation of *Rheum palmatum*, var. *tanguticum*, has been begun within the last few years in the United States.

Rhubarb is also prepared for use in medicine from wild species in the Himalayas and Java.

2. The rhubarb used as a vegetable consists of the leaf stalks of several hybrids between the species *R. Rhaponticum*, *R. undulatum*, *R. palmatum*. The petioles of *R. officinale* have also been proved to be edible; but that plant is grown more frequently on account of its ornamental foliage (see HORTICULTURE, vol. xii. p. 287).

(E. M. H.)

RHYL, a watering-place of North Wales, in the county of Flint, is situated near the mouth of the Clwyd, 30 miles north-west of Chester and 10 north-north-west of Denbigh, a railway line to which here joins that from Chester to Holyhead. Only recently it was a small fishing village. Its chief advantages as a watering-place are the pure air and extensive firm sands. Although the situation of the town was formerly bare and cheerless, much has been done to improve it. There are many handsome houses, and the neighbouring country is interesting both from its scenery and from its castles and other ancient buildings. The town possesses a town-hall, extensive winter gardens, racquet courts, lawn-tennis grounds, and other attractions. The east and west parades face the sea, and the pier, constructed of iron, is 700 feet in length. There is daily communication by steamer with Liverpool, Llandudno, Bangor, &c. The population of the urban sanitary district (area 600 acres) in 1871 was 4500, and in 1881 it was 6029.

RHYMER, THOMAS THE. See THOMAS OF ERCELDOUNE.

RHYMNEY, an urban sanitary district of Monmouthshire, on the borders of Glamorganshire, is situated in the valley of the Rumney river, 20 miles west of Abergavenny, and 22 north of Cardiff. It owes its importance to the neighbouring coal mines and to its iron and steel works, which employ nearly the whole population. The works of the Rhymney Iron Company, including blast furnaces and

¹ Jour. Pharm. Soc., [3], vi. p. 65.

² According to Mr F. Newcombe, *Mea. Press and Circ.*, August 2, 1882, the Chinese esteem the Shen-se rhubarb as the best, that coming from Kanchow being the most prized of all; Sze-chuen rhubarb has a rougher surface and little flavour, and brings only about half the price; Chung-chi rhubarb also is greatly valued, while the Chichuang, Tai-huang, and Shan-huang varieties are considered worthless.

rolling mills, are among the largest of the kind in England. The town consists chiefly of plain houses inhabited by workpeople, the principal building being the church, a handsome structure in the Doric style erected in 1842. The population of the urban sanitary district (area 2890 acres) in 1871 was 8138, and in 1881 it was 8663.

RIAZAN. See RYAZAN.

RIBAULT, or RIBAUT, JEAN (c. 1520–1565), a French navigator rendered famous by his connexion with the early settlement of FLORIDA (*q.v.*), was born at Dieppe, probably about 1520. Appointed by Coligny to the command of a colonizing expedition (from which the admiral was not deterred by the failure of Nicolas Durand de Villegagnon on a similar mission), Ribault sailed on 18th February 1562 with two vessels, and on 1st May landed at St John's river, or, as he called it, Rivière de Mai. Having settled his colonists at Port Royal Harbour and built Fort Charles for their protection, he returned to France to find the country in the throes of the civil war. In 1563 he appears to have been in England and to have issued *The whole and true discoverie of Terra Florida*. In April 1564 Coligny was in a position to despatch another expedition under Laudonnière; but meanwhile Ribault's colony had come to an untimely end, the unfortunate adventurers, destitute of supplies from home, having revolted against their governor and attempted to make their way back to Europe in a boat which was happily picked up, when they were in the last extremities, by an English vessel. In 1565 Ribault was again sent out to satisfy the admiral as to Laudonnière's management of his new settlement, Fort Caroline, on the Rivière de Mai. While he was still there the Spaniards under Menendez de Avila, though their country was at peace with France, attacked the French ships at the mouth of the river. Ribault set out to retaliate on the Spanish fleet, but his vessels were wrecked by a storm near Cape Cañaveral and he had to attempt to return to Fort Caroline by land. The fort had by this time fallen into the hands of the Spaniards, who had slaughtered all the colonists except a few who got off with two ships under Ribault's son. Induced to surrender by false assurances of safeguard, Ribault and his men were also put to the sword in October 1565. The massacre was avenged in kind by Dominique de Gourgues two years later.

See Haag, *La France Protestante, s.v.*; French, *Hist. Collections of Louisiana and Florida*; Parkman, *Pioneers of France in the New World*.

RIBBON-FISHES (*Trachypteridae*), a family of marine fishes readily recognized by their long, compressed tape-like body, short head, narrow mouth, and feeble denti-

ties. The pectoral fins are small, the ventrals composed of several rays, or of one long ray only. Ribbon-fishes possess all the characteristics of fishes living at very great depths. They are extremely fragile when found floating on the surface or thrown ashore, and rarely in an uninjured condition; the rays of their fins especially, and the membrane connecting them, are of a very delicate and brittle structure. In young ribbon-fishes some of the fin-rays are prolonged in an extraordinary degree, and sometimes provided with appendages (see fig. 2). The largest of

FIG. 2.—Young *Trachypterus*.

ribbon-fishes are the species of *Regalecus* (see OAR-FISH), of which specimens some 20 feet long by 12 inches in depth of body and 2 inches in thickness have been found. Like all deep sea fishes they occur in all seas. The most common of the British seas is the Vagmaer or Deal-Fish (*Trachypterus arcticus*) from 3 to 5 feet long, of which almost every year after the equinoctial gales specimens are picked up on the coasts of North Britain, of the Orkneys, Scandinavia, and Iceland (see also ICHTHYOLOGY, vol. xii. pp. 684, 691).

RIBBONS. By this name are designated narrow webs, properly of silk, not exceeding nine inches in width, used primarily for binding and tying in connexion with dress, but also now applied for innumerable useful, ornamental, and symbolical purposes. Along with that of tapes, fringes, and other smallwares, the manufacture of ribbons forms a special department of the textile industries. It is obvious that the weaving of very narrow fabrics, piece by piece, on separate looms would be a tedious and expensive process; yet for ages such was the only method of making ribbons. The essential feature of a ribbon loom is the simultaneous weaving in one loom frame of two or more webs, going up to as many as forty narrow fabrics in modern looms. To effect the conjoined throwing of all the shuttles and the various other movements of the loom the automatic action of the power-loom is necessary; and it is a remarkable fact that the self-acting ribbon loom was known and extensively used more than a century before the famous invention of Cartwright. A loom in which several narrow webs could be woven at one time is mentioned as having been working in Danzig towards the end of the 16th century. Similar looms were at work in Leyden in 1620, where their use gave rise to so much discontent and rioting on the part of the weavers that the states general had to prohibit their use. The prohibition was renewed at various intervals throughout the century, and in the same interval the use of the ribbon loom was interdicted in most of the principal industrial centres of Europe. About 1676, under the name of the Dutch loom or engine loom, it was brought to London; and, although its introduction there caused some disturbance, it does not appear to have been prohibited. In 1745 the celebrated John Kay, the inventor of the fly-shuttle, obtained, con-

FIG. 1.—*Trachypterus tænia*.

tion. A high dorsal fin occupies the whole length of the back; an anal is absent, and the caudal, if present,

jointly with Joseph Stell, a patent for improvements in the ribbon loom; and since that period it has benefited by the inventions applied to weaving machinery generally.

Ribbon weaving is known to have been established near St Étienne (dep. Loire) so early as the 11th century, and that town to the present day continues to be the headquarters of the industry. In the time of Louis XIV. the ribbon trade there gave employment to about 6000 persons; now about 17,000 looms are in operation in the district, 1500 of which are power-looms in factories. Statistics compiled in 1881 give the annual value of the trade at 63,400,000 francs, of which 45,000,000 francs was the value of ribbons proper, the remainder being represented by scarfs, trimmings, elastic web, chenille, &c. During the Huguenot troubles, ribbon weavers from St Étienne settled at Basel and there established an industry which now rivals that of the original seat of the trade. In the Basel district the looms number 8000; but one-half of these are power-looms in factories, which have a much greater productive capacity than the domestic looms. Crefeld is the centre of the German ribbon industry, the manufacture of black velvet ribbon being there a specialty. In Vienna about 2000 looms are employed. Next to St Étienne and Basel, Coventry is the most important seat of ribbon making, and to some extent the industry is also prosecuted at Norwich and Leicester. The average annual value of the ribbon trade of western Europe and America is £16,000,000. A large proportion of the ribbons now made are mixed fabrics of silk and cotton.

RIBERA, JUSEPE, or, in Italian, GIUSEPPE (1588–1656), commonly called Lo SPAGNOLETTO, or the Little Spaniard, a leading painter of the Neapolitan or partly of the Spanish school, was born near Valencia in Spain, at Xativa, now named S. Felipe, on 12th January 1588. His parents intended him for a literary or learned career; but, having an innate tendency to design, he neglected the regular studies, and entered the school of the Spanish painter Francisco Ribalta. Fired with a longing to study art in its Italian headquarters, he somehow, while still quite a youth, made his way to Rome, worked vehemently, and struggled with hunger and destitution. Early in the 17th century a cardinal noticed him in the streets of Rome drawing from the frescos on a palace façade; he took up the ragged stripling and housed him in his mansion. Artists had then already bestowed upon the alien student, who was perpetually copying all sorts of objects in art and in nature, the nickname of Lo Spagnoletto. In the cardinal's household Ribera was comfortable but dissatisfied; he found his studies in abeyance, and one day he decamped. He then betook himself to the famous painter Michelangelo da Caravaggio, the head of the naturalist school, called also the school of the Tenebrosi, or shadow-painters, owing to the excessive contrasts of light and shade which marked their style. In this method of art Ribera, though not claiming the first place as initiator, was destined to rank as hardly second to Caravaggio himself. The Italian master gave every encouragement to the Spaniard, but not for long, as he died in 1609. Ribera, who had in the first instance studied chiefly from Raphael and the Caracci, had by this time acquired so much mastery over the tenebroso style that his performances were barely distinguishable from Caravaggio's own. He now went to Parma, and worked after the frescos of Correggio with great zeal and efficiency; in the museum of Madrid is his Jacob's Ladder, which is regarded as his *chef-d'œuvre* in the Correggesque manner. From Parma Spagnoletto returned to Rome, where he resumed the style of Caravaggio, which was doubtless more conformable to his natural bent, and shortly afterwards he migrated to Naples, which became his permanent home.

Ribera was as yet still poor and inconspicuous, but a rich picture-dealer in Naples soon discerned in him all the stuff of a successful painter, and gave him his daughter in marriage. This was the turning point in the Spaniard's fortunes. He painted a Martyrdom of St Bartholomew, which the father-in-law exhibited from his balcony to a

rapidly increasing and admiring crowd. The popular excitement grew to so noisy a height as to attract the attention of the Spanish viceroy the Count de Monterey. From this nobleman and from the king of Spain, Philip IV., commissions now flowed in upon Ribera. Various professional honours followed; he painted with incessant vigour; his house became a centre of fashionable concourse; and he made vast sums of money. In the streets he only appeared in his carriage—then a sure criterion of affluence. After a while he found it necessary to curb his own and his patrons' appetite for work, and he limited himself to six hours in the day, ending towards noon. With prosperity came grasping and jealous selfishness. Spagnoletto, chief in a triumvirate of greed, his abettors being a Greek painter, Belisario Corenzio, and a Neapolitan, Giambattista Caracciolo, determined that Naples should be an artistic monopoly; by intrigue, terrorizing, and personal violence on occasion they kept aloof all competitors. Annibale Caracci, the Cavalier d'Arpino, Guido, Domenichino, all of them successively invited to work in Naples, found the place too hot to hold them. Domenichino was so persecuted and victimized that his life was probably abridged by these truly "tenebrous" machinations. The cabal ended at the time of Caracciolo's death in 1641.

The close of Ribera's triumphant career has been variously related. If we are to believe Dominici, the historian of Neapolitan art, he totally disappeared from Naples in 1648 and was no more heard of,—this being the sequel of the abduction, by Don John of Austria, son of Philip IV., of the painter's beautiful only daughter Maria Rosa. Dominici indeed will not even allow that Ribera was a Spaniard by birth: he alleges that the painter, though of Spanish descent, was born at Gallipoli, in the province of Lecce, kingdom of Naples. But these assertions have not availed to displace the earlier and well-authenticated statement that Ribera, a genuine Spaniard in the fullest sense, died peaceably and wealthy in Naples in 1656. His own signature on his pictures is constantly "Jusepe de Ribera, Español." His daughter, so far from being disgraced by an abduction, married a Spanish nobleman who became a minister of the viceroy.

The pictorial style of Spagnoletto is extremely powerful; or one might better define its special quality as immensely forcible, equally sustaining the test of a distant and general or of a close and scrutinizing view. In his earlier style, founded (as we have seen) sometimes on Caravaggio and sometimes on the wholly diverse method of Correggio, the study of Spanish and Venetian masters can likewise be traced. Along with his massive and predominating shadows, he retained from first to last great strength of local colouring. His forms, though ordinary and partly gross, are correct; the impression of his works gloomy and startling. He delighted in subjects of horror: an agonizing martyrdom—the gridiron of Lawrence, the flaying knife of Bartholomew, or the vulture of Prometheus—had for him no repulsion but a grim fascination. He had many imitators, his influence extending from Naples to other parts of Italy, and also to his native Spain. Salvator Rosa and Luca Giordano were his most distinguished pupils; also Giovanni Do, Enrico Fiammingo, Michelangelo Fracanzani, and Aniello Falcone, who was the first considerable painter of battle-pieces. Among Ribera's principal works should be named St Januarius Emerging from the Furnace, in the cathedral of Naples; the Descent from the Cross, in the Neapolitan Certosa, generally regarded as his masterpiece; the Adoration of the Shepherds (a late work, 1650), now in the Louvre; the Martyrdom of St Bartholomew, in the museum of Madrid; the Pieta in the sacristy of S. Martino, Naples. His mythologic subjects are generally unpleasant—such as the Silenus, in the Studi Gallery of Naples, and Venus Lamenting over Adonis, in the Corsini Gallery of Rome. The Louvre contains altogether twenty-five of his paintings; the London National Gallery two—one of them, a Pieta, being an excellent though not exactly a leading specimen. He executed several fine male portraits; among others his own likeness, now in the collection at Alton Towers. He also produced twenty-six etchings, ably treated. For the use of his pupils, he drew a number of elementary designs, which in 1650 were etched by Francisco Fernandez, and which continued much in

vogue for a long while among Spanish and French painters and students.

Besides the work of Dominici already referred to (1840-46), the *Diccionario Historico* of Cean Bermudez is a principal authority regarding Ribera and his works. (W. M. R.)

RIBES. See CURRANT and GOOSEBERRY.

RICARDO, DAVID (1772-1823), a celebrated political economist, was born at London 19th April 1772. He was the third son of his father, a Jewish gentleman of Dutch birth, whose family, it is said, had formerly resided in Portugal. The elder Ricardo bore an honourable character, and was a successful member of the Stock Exchange. The son was placed for two years at a commercial school in Holland, and at the age of fourteen entered his father's office, where he showed much aptitude for business. About the time when he attained his majority he abandoned the Hebrew faith, and conformed to the Anglican Church, a change which seems to have been connected with his marriage to Miss Wilkinson, which took place in 1793. In consequence of the step thus taken he was separated from his family and thrown on his own resources. His ability and uprightness were known, and he at once entered on such a successful career in the profession to which he had been brought up that at the age of twenty-five, we are told, he was already rich. He now began to occupy himself with scientific pursuits, and gave some attention to mathematics as well as to chemistry and mineralogy; but, having met with Adam Smith's great work in 1799 at Bath, whither he had gone for his wife's health, he threw himself with ardour into the study of political economy.

His first publication (1809) was *The High Price of Bullion a Proof of the Depreciation of Bank Notes*. This tract was an expansion of a series of articles which the author had contributed to the *Morning Chronicle*. It gave a fresh stimulus to the controversy, which had for some time been discontinued, respecting the resumption of cash payments. Ricardo argued that the premium on bullion and the unfavourable state of the exchanges could only be explained by the depreciation of the inconvertible paper money then in circulation, which had fallen 25 per cent. below the value of specie in consequence of its over-issue. A committee to consider the whole question, commonly known as the Bullion Committee, was nominated by the House of Commons in February 1810. Amongst the members were Francis Horner, who was appointed chairman, Alexander Baring (afterwards Lord Ashburton), William Huskisson, and Henry Thornton, author of the well known *Inquiry into the Nature and Effects of the Paper Credit of Great Britain* (1802). The report, which was presented to parliament in June of the same year, was the joint production of Horner, Huskisson, and Thornton. It asserted the same views which Ricardo had put forward, and recommended the repeal of the Bank Restriction Act. Notwithstanding this, the House of Commons of the following year, on the motion of Mr Vansittart (afterwards Lord Bexley), declared in the teeth of the facts that paper had undergone no depreciation, and negatived Horner's resolutions founded on the report of the committee. One of the strongest opponents of Ricardo's opinions was Mr Bosanquet; he published in 1811 a pamphlet entitled *Practical Observations on the Report of the Bullion Committee*, and this drew forth from Ricardo an elaborate reply. Both this tract and its predecessor attracted much attention. They propound no new economic principles, but are based on the doctrines of Smith. They do not give such a systematic and complete view of the subject as Huskisson's well-known tract (*The Question respecting the Depreciation of the Currency Stated and Examined*, 1810), but they are well reasoned, and, as to their main conclusions, convincing. It has, however, been maintained

that there were features of the case which Ricardo did not sufficiently take into account, especially the demand for bullion created by the necessity of meeting the foreign payments of England, which, in consequence of the Continental system, could not be otherwise discharged.

In 1811 he made the acquaintance of James Mill, whose introduction to him arose out of the publication of Mill's tract entitled *Commerce Defended*. The conversation of Ricardo's new friend seems to have largely influenced his views; Bentham indeed declared him to be Mill's intellectual child; but, whilst Mill doubtless largely affected his political ideas, he was, on his side, under obligations to Ricardo in the purely economic field; Mill said in 1823 that he himself and J. R. McCulloch were Ricardo's disciples, and, he added, his only genuine ones.

In 1815, when the Corn Laws were under discussion, he published his *Essay on the Influence of a Low Price of Corn on the Profits of Stock*. This was directed against a recent tract by Malthus entitled *Grounds of an Opinion on the Policy of Restraining the Free Importation of Foreign Corn*. The reasonings of the essay are based on the theory of rent which has often been called by the name of Ricardo; but the author distinctly states that it was not due to him. "In all that I have said concerning the origin and progress of rent I have briefly repeated, and endeavoured to elucidate, the principles which Malthus has so ably laid down on the same subject in his *Inquiry into the Nature and Progress of Rent*." We now know that the theory had been fully stated, before the time of Malthus, by Anderson; it is in any case clear that it was no discovery of Ricardo. Even the conception of the soils of a country as comparable to a series of machines of different original powers, though capable of improvement by the application of capital, is quoted from Malthus. Ricardo states in this essay a set of propositions, most of them deductions from the theory of rent, which are in substance the same as those afterwards embodied in the *Principles*, and regarded as characteristic of his system, such as that increase of wages does not raise prices; that profits can be raised only by a fall in wages and diminished only by a rise in wages; and that profits, in the whole progress of society, are determined by the cost of the production of the food which is raised at the greatest expense. It does not appear that, excepting the theory of foreign trade, anything of the nature of fundamental doctrine, as distinct from the special subjects of banking and taxation, is laid down in the *Principles* which does not already appear in this tract. We find in it, too, the same exclusive regard to the interest of the capitalist class, and the same identification of their interest with that of the whole nation, which are generally characteristic of his writings. "Rent," he says, "is in all cases a portion of the profits previously obtained on the land," a proposition by which, for the sake, it is to be feared, of creating a political prejudice, he obscures his own doctrine that true rent can never be a part of profit; and he alleges what is in a sense true, but has a most invidious effect,—that "the interest of the landlord is always opposed to the interest of every other class in the community," though the existence of a distinct landlord class is by no means a necessity, and the owner of rent, which somebody must own, could not, even by entirely remitting it, alter the price of food, or increase the profits of the capitalist, except by presenting him with a gift to which he has no economic claim. At the close of the tract he endeavours to show in opposition to Malthus that the danger of dependence on foreign supply for a large part of our food, and the losses on invested capital which would result from a legislative change, could not be so serious as to counterbalance the advantages arising from a free importation.

Both parts of this proposition are probably true; but he does not establish the first in a very satisfactory manner.

In the *Proposals for an Economical and Secure Currency* (1816) he first disposes of the chimera of a currency without a specific standard, and pronounces in favour of a single metal, with a preference for silver, as the standard. He then puts forward a scheme which had been already briefly indicated in the appendix to the 4th edition (1811) of his *High Price of Bullion*. This was that the bank should be obliged to deliver on demand, not coin, but uncoined bullion or gold standard bars, in exchange for its notes, whenever the notes presented together for payment reached a moderate fixed amount. The consequence would be that, all the smaller payments being made in the cheap medium, paper, the country would enjoy the profit derivable from the metallic currency used as a capital; the wear of the coinage, too, would be prevented, and a saving thus effected. By this method the public would secure itself against any variations in the value of the currency beyond those to which the standard itself is necessarily subject; and, at the same time, the circulation would be carried on in the least expensive way. Thus, whilst the use of the precious metals as the medium of exchange was, in the earlier stages of social life, one of the most important steps towards the improvement of commerce and the advancement of civilization, it is proposed to us, and on grounds which it is difficult to gainsay, to banish them once more from such employment in almost all the internal transactions of a country. A kindred revolution, tending to the further elimination of metallic money, Jevons has spoken of as "a return to barter"; but that expression is misleading, for in the modern system of settlement by writing off liabilities against each other a metallic standard is always supposed, and lies at the basis of every transaction, whereas in the primitive method of dealing commodities were directly compared. Ricardo's plan was in operation for some time, but was then given up on the ground, urged by the bank, of the frequent forgery of one pound notes, and the consequent necessity of replacing them with coin—a very insufficient reason, as experience demonstrates, though a good argument in favour of such an improved manufacture of notes as would effectually defeat fraudulent imitation. In a later tract (*Plan for a National Bank*) Ricardo proposes that one pound notes should be confined to the country districts. The general plan has been objected to on the ground that it would not provide for a sufficient metallic reserve to meet sudden emergencies arising from the necessity of foreign payments.

Ricardo's chief work, *Principles of Political Economy and Taxation*, appeared in 1817. A full account of the general theory expounded in this treatise has been given under POLITICAL ECONOMY; a very brief statement must here suffice. The fundamental doctrine is that, on the hypothesis of free competition, exchange value is determined by the labour expended in production,—a proposition not new, nor, except with considerable limitation and explanation, true, and of little practical use, as "amount of labour" is a vague expression, and the thing intended is incapable of exact estimation. Ricardo's theory of distribution has been briefly enunciated as follows:—"(1) the demand for food determines the margin of cultivation; (2) this margin determines rent; (3) the amount necessary to maintain the labourer determines wages; (4) the difference between the amount produced by a given quantity of labour at the margin and the wages of that labour determines profit." These theorems are too absolutely stated, and require much modification to adapt them to real life. His theory of foreign trade has been embodied in the two propositions—"(1) international values

are not determined in the same way as domestic values; (2) the medium of exchange is distributed so as to bring trade to the condition it would be in if it were conducted by barter." His views on currency and banking will be gathered from the present article.

A considerable portion of the work is devoted to a study of taxation, which requires to be considered as a part of the problem of distribution. A tax is not always paid by those on whom it is imposed; it is therefore necessary to determine the ultimate, as distinguished from the immediate, incidence of every form of taxation. Smith had already dealt with this question; Ricardo develops and criticizes his results. The conclusions at which he arrives are deduced from the theory of rent and from the assumptions of a uniform rate of profits and of a rate of wages coincident with the necessary subsistence of the labourer. They are in the main as follows:—a tax on raw produce falls on the consumer, but will also diminish profits; a tax on rents on the landlord; taxes on houses will be divided between the occupier and the ground landlord; taxes on profits will be paid by the consumer, and taxes on wages by the capitalist. These propositions of course participate in the infirmity of the premises from which they are deduced, or must at least be taken with limitations corresponding to those to which the premises are subject. Ricardo adopts and even extols as a "golden maxim" the shallow dictum of Say, that "the very best of all plans of finance is to spend little, and the best of all taxes is that which is of least amount."

In 1819 Ricardo, having retired from business and become a landed proprietor, entered parliament as member for Portarlington. He was at first diffident and embarrassed in speaking, but gradually overcame these difficulties, and was heard with much attention and deference, especially when he addressed the house on economic questions. He probably contributed in a considerable degree to bringing about the change of opinion on the question of free trade which ultimately led to the legislation of Sir Robert Peel on that subject.

In 1820 he contributed to the supplement of the *Encyclopædia Britannica* (6th ed.) an *Essay on the Funding System*. In this, besides giving an historical account (founded on Dr Robert Hamilton's valuable work *On the National Debt*, 1813, 3d ed., 1818) of the several successive forms of the sinking fund, he urges that nations should defray their expenses, whether ordinary or extraordinary, at the time when they are incurred, instead of providing for them by loans; and, not believing that the system of a sinking fund would ever be consistently and perseveringly carried out, he maintains that the national debt should be paid off by a tax on property—an operation which he thought might be completed in two or three years during peace. Thus, by a single effort we might, he says, get rid of those great sources of demoralization, the customs and the excise, and our commerce would be freed from "all the vexatious delays and interruptions which our present artificial system imposes upon it."

In 1822 he published a tract *On Protection to Agriculture*, which is an able application to controversy of the general principles laid down in his systematic work. Its arguments and conclusions are therefore subject to the same limitations which those fundamental principles require. He does not advocate an absolutely free importation of corn, but proposes, in consideration of the special burdens on agriculture, to impose on the foreign commodity a duty equivalent to the exclusive taxes imposed on home growers, as well as to allow a drawback on exportation equal to the duty. The only point of much interest in the tract, apart from the question of protection, is the assertion of the doctrine that a high rate of interest is

beneficial to a country—a view curiously opposed to that held by Child and others in the 17th century. "Profits and interest," he says, "cannot be too high. Nothing contributes so much to the prosperity and happiness of a country as high profits." It seems to follow that, the productiveness of labour being given, wages cannot be too low, which can only be true on the supposition,¹ tacitly assumed by Ricardo in many places, that wages coincide with the cost of the labourer's maintenance. The proposition, too, appears to lead to economic pessimism, for, according to his own doctrines, the rate of profits must inevitably decline in the course of the history of any society.

In his *Plan for the Establishment of a National Bank*, published posthumously in 1824, he proposes that the issue of the paper currency should be taken out of the hands of the Bank of England, and vested in commissioners appointed by the Government, but not removable except on an address from one or both Houses of Parliament. These functionaries should in no case lend money to the ministers of the crown, who, when they wanted it, should raise it by taxation or have recourse to the general market. The commissioners would act as bankers to all the public departments, but would be precluded from fulfilling the same office for any corporation or individual whatever. Their great business would be to regulate the issue of paper by the price of bullion, so as to keep the value of the former equal to that of the coins it would represent. The tract describes in detail the measures to be adopted for the introduction and working of the new system. A certain step towards realizing the objects of this scheme, though on different lines from Ricardo's, was taken in Sir Robert Peel's Act of 1844, by which the discount business of the bank was separated from the issue department.

Ricardo died on the 11th September 1823, at his seat (Gatcomb Park) in Gloucestershire. He was only fifty-one years of age, and there had been nothing in his general health to give rise to apprehension; the cause of death was a cerebral affection resulting from disease of the ear. He was much regretted, as he had been highly esteemed, both in public and private life. His character is represented in very favourable colours by those who knew him best. He is described as modest, candid, and ever open to conviction,—as affectionate in his family, steady in his friendships, and generous and kind in his wider personal relations. James Mill, who was intimately acquainted with him, says (in a letter to Napier of November 1818) that he knew not a better man, and on the occasion of his death published a highly eulogistic notice of him in the *Morning Chronicle*. A lectureship on political economy, to exist for ten years, was founded in commemoration of him, M'Culloch being chosen to fill it.

In forming a general judgment respecting Ricardo, we must have in view not so much the minor writings, to which this article has been in great part devoted, as the *Principles*, in which his economic system is expounded as a whole. By a study of this work we are led to the conclusion that he was an economist only, not at all a social philosopher in the wider sense, like Adam Smith or John Mill. He had great acuteness, but little breadth. For any large treatment of moral and political questions he seems to have been alike by nature and preparation unfitted; and there is no evidence of his having had any but the most ordinary and narrow views of the great social problems. His whole conception of human society is material and mechanical, the selfish principle being regarded, after the manner of the Benthamites, as omnipotent, not merely in practical economy, but, as appears from his speech on the ballot and his tract on reform, in the whole extent of the social field. Roscher calls him "ein tiefer Menschenkenner"; it would be difficult to characterize him more inaptly. The same writer remarks on his "capitalistic" tone, which, he says, becomes "mammonistic"

in some of his followers; but the latter spirit is already felt as the pervading atmosphere of Ricardo's works. He shows no trace of that hearty sympathy with the working classes which breaks out in several passages of the *Wealth of Nations*; we ought, perhaps, with Held, to regard it as a merit in Ricardo that he does not cover with fine phrases his deficiency in warmth of social sentiment. The idea of the active capitalist having any duties towards his employés never seems to occur to him; the labourer is, in fact, merely an instrument in the hands of the capitalist, a pawn in the game he plays. His principal work is the ultimate expression of what Comte calls "l'ignoble métaphysique qui prétend étudier les lois générales de l'ordre matériel en l'isolant de tout autre." Against such a picture of industrial life as a mere sordid struggle of conflicting interests contemporary socialism is the necessary, though formidable, protest; and the leaders of that movement have eagerly seized his one-sided doctrines and used them for their own ends.

He first introduced into economics on a great scale the method of deduction from *a priori* assumptions. The conclusions so arrived at have often been treated as if they were directly applicable to real life, and indeed to the economic phenomena of all times and places. But the truth of Ricardo's theorems is now by his warmest admirers admitted to be hypothetical only, and they are stated as applying, at most, to the existing highly-developed condition of European, and especially of English, commerce. Bagehot, however, seems right in believing that Ricardo himself had no consciousness of the limitations to which his doctrines are subject. Be this as it may, we now see that the only basis on which these doctrines could be allowed to stand as a permanent part of economic science is that on which they are placed by Roscher, namely, as a stage in the preparatory work of the economist, who, beginning with such abstractions, afterwards turns from them, not in practice merely, but in the completed theory, to real life and men as they actually are or have been. But it may well be doubted whether it is not better to discard them altogether, and begin, as we end, with an historical method, which, it may be added, will of necessity lead to the introduction of those moral and social considerations which would otherwise be almost certainly overlooked.

The criticisms to which Ricardo's general economic scheme is open do not hold with respect to his treatment of the subjects of currency and banking. These form precisely that branch of economics into which moral ideas (beyond the plain prescriptions of honesty) can scarcely be said to enter, and where the operation of purely mercantile principles is most immediate and invariable. They were, besides, the departments of the study to which Ricardo's early training and practical habits led him to give special attention; and they have a lasting value independent of his systematic construction.

Ricardo's collected works were published, with a notice of his life and writings, by J. R. M'Culloch in 1846. A French translation of the *Principles* by Constandio, with notes by Say, appeared in 1818; the whole works, translated by Constandio and Fonteyrand, form vol. xiii. (1847) of the *Collection des Principaux Économistes*, where they are accompanied by the notes of Say, Malthus, Sismondi, Rossi, &c. The *Principles* was first "naturalized" in Germany, says Roscher (though another version by Von Schmid had previously appeared), by Edward Baumstark in his *David Ricardo's Grundgesetze der Volkswirtschaft und der Besteuerung übersetzt und erläutert* (1837), which Roscher highly commends, not only for the excellence of the rendering, but for the value of the explanations and criticisms which are added. (J. K. I.)

RICCATTI, JAMES, COUNT (1676-1754), a celebrated Italian mathematician, was born at Venice, May 8, 1676, and died at Treviso, April 15, 1754. He studied at the university of Padua, where he graduated in 1696. Riccati was deeply read in history, belles lettres, architecture, and poetry—in fact, was a highly cultivated man; his favourite pursuits, however, were scientific, and his authority on all questions of practical science was referred to by the senate of Venice. He corresponded with many of the European savants of his day, and contributed largely to the *Acta Eruditorum* of Leipsic. He was offered the presidency of the academy of science of St Petersburg; but this high distinction he declined, preferring the leisure and independence of life in Italy. Riccati's name is best known and will be preserved by mathematicians in connexion with his celebrated problem called Riccati's equation, published in the *Acta Eruditorum*, September 1724. A very valuable and complete account of this equation and its various transformations has been recently given by Mr J. W. L. Glaisher, F.R.S., in the *Transactions* of the Royal Society (1881, pp. 759-829).

After Riccati's death his works were collected by his sons and published in four volumes. His sons, Vincenzo (1707-1775) and Giordano (1709-1790), inherited his talents. The former was professor of mathematics at Bologna, and published, among other works, a large treatise on the calculus. Giordano was distinguished both as a mathematician and an architect.

¹ The same assumption had been previously made by the Physiocrats. Turgot says, "En tout genre de travail, il doit arriver et il arrive que le salaire de l'ouvrier se borne à ce qui est nécessaire pour se procurer sa subsistance."

RICCI, MATTEO (1552-1610), is eminent as practically the founder of Christian missions in modern China.

He was born of a noble family at Macerata in the March of Ancona on 7th October 1552, two months before Francis Xavier, burning with the desire to carry his message into China, died at its gates. After some education at a Jesuit college in his native town, Ricci, at the age of sixteen, was sent by his father to study law at Rome. But the youth had already contemplated entering the Jesuit Company, and this purpose he accomplished about 1571, without informing his father, of whose opposition he was aware, until the step had been taken. The father instantly started for Rome, but was stopped by illness, and abandoned opposition.

In 1577 Ricci and several other Italian students of noble birth offered themselves for the East Indian missions; and Ricci, without visiting his family to take leave, proceeded to Portugal. His comrades were Rudolfo Acquaviva, Nicolas Spinola, Francesco Pasio, and Michele Ruggieri, all afterwards, like Ricci himself, famous in the Jesuit annals. They arrived at Goa in September 1578. After four years spent in India, Ricci was summoned to the task of opening China to evangelization.

Several attempts had been made by Xavier, and since his death, to introduce the church into China,—as by Melchior Nunes of the Jesuit society operating from Sanchian¹ in 1555; by Gaspar da Cruz, a Dominican, in that or the following year; by the Augustinians under Martin Herrada, 1575; and in 1579 by the Franciscans led by Pedro d'Alfaro; but all these attempts proved abortive. In 1571 a house of the Jesuits had been set up at Macao (where the Portuguese were established in 1557), but their attention was then occupied with Japan, and it was not till the arrival at Macao of Alessandro Valignani on a visitation in 1582 that work in China was really taken up. For this object he had obtained the services first of M. Ruggieri and then of Ricci. After various disappointments they found access to Chau-king-fu on the Si-Kiang or West River of Canton, where the viceroy of the two provinces of Kwang-tung and Kwang-si then had his residence, and by favour of this personage they were enabled to establish themselves, and there spent several years. Their proceedings were very cautious and tentative; they excited the curiosity and interest of even the more intelligent Chinese by their clocks, their globes and maps, their books of European engravings, and by Ricci's knowledge of mathematics, including dialling and the like, and the projection of maps. They conciliated some influential friends, and their reputation spread pretty widely in China. This was facilitated by the Chinese system of transfer of public officers from one province of the empire to another, and in the later movements of the missionaries they frequently met with one and another of their old acquaintances in office, who were more or less well disposed. Eventually troubles arose at Chau-king which compelled them to seek a new locality; and in 1589, with the viceroy's sanction, they migrated to Chang-chau in the northern part of Kwang-tung, not far from the well known Meiling Pass.

During his stay here Ricci was convinced that a mistake had been made in adopting a dress resembling that of the bonzes, thus identifying the missionaries with a class who were the objects either of superstition or of contempt. With the sanction of the visitor it was ordered that in future the missionaries should adopt the costumes of Chinese literates. And, in fact, they before long adopted Chinese manners altogether.

¹ The island (properly Shang-chuan) on which the Portuguese had a temporary settlement before they got Macao, and on which F. Xavier died.

Chang-chau, as a station, did not prove a happy selection, but it was not till 1595 that an opportunity occurred of travelling northward. We cannot follow Ricci's movements in detail, or the vicissitudes of favour and trouble which attended his plans. The latter were, on the whole, never very grave. For some time his residence was at Nan-chang-fu, the capital of Kiang-si; but in 1598 he was enabled to proceed under favourable conditions to Nanking, and thence, for the first time, to Peking, which had all along been the goal of his missionary ambition. But circumstances were not then propitious, and the party had to return to Nanking. The fame of the presents which they carried had, however, reached the court, and the Jesuits were summoned north again, and on the 24th January 1601 they entered the capital. Wan-lieh, the emperor of the Ming dynasty, in those days lived in seclusion, and saw no one but his women and the eunuchs. But the missionaries were summoned to the palace; their presents were immensely admired; and the emperor had the curiosity to send for portraits of the fathers themselves.

They obtained a settlement, with an allowance for subsistence, in Peking, and from this time to the end of his life Ricci's estimation among the Chinese was constantly increasing, as was at the same time the amount of his labours. Visitors, who were never turned away, thronged the mission residence incessantly; inquiries coming to him from all parts of the empire, from strangers as well as acquaintances, respecting the doctrines which he taught, or the numerous Chinese publications which he issued, had to be answered. This in itself was a great burden, as Chinese composition, if wrong impressions are to be avoided, demands extreme care and accuracy. As head of the mission, which now had four stations in China, he also devoted much time to answering the letters of the priests under him, a matter on which he spared no pains or detail. The new converts had to be attended to—always welcomed, and never hustled away. Besides these came the composition of his Chinese books, the teaching of his people, and the maintenance of the record of the mission history which had been enjoined upon him by the general of the order, and which he kept up to the most recent dates. Thus his labours were wearing and incessant. In May 1610 he broke down, and after an illness of eight days died on the 11th of that month, aged fifty-eight. His coadjutor, Pantoja applied to the emperor for a burying-place outside the city. This, after due consideration by the boards concerned, was granted, with the most honourable official testimonies to the reputation and character of Ricci; and a large building in the vicinity of the city was at the same time bestowed upon the mission for their residence.

Ricci's character, his acquirements, and the use he made of them were certainly worthy of all honour. We do not know what amount of success in conversion had rewarded his labours during his life, but some eminent and creditable converts there were, and his work was the foundation of the considerable spread which the Roman Catholic Church has since attained in China. When the missionaries of other Roman Catholic orders made their way into China, some twenty years after the death of Ricci, they found great fault with the manner in which certain Chinese practices had been dealt with by the Jesuits, a matter in which Ricci's action and policy had given the tone to the mission in China,—though in fact that tone was rather inherent in the Jesuit system than the outcome of individual character, for controversies of an exactly parallel nature arose two generations later in southern India, between the Jesuits and Capuchins, regarding what were called "Malabar rites." The controversy thus kindled in China burned for considerably more than a century with great fierceness,² and we can here, in connexion with the career of Ricci, but indicate its existence. The chief points of controversy were (1) the lawfulness and expediency of certain terms employed by the

² The list of the literature of this controversy occupies forty-one columns in M. Cordier's excellent *Bibliographie de la Chine*.

Jesuits in naming God Almighty, such as *Tien*, "Heaven," and *Shang-ti*, "Supreme Ruler" or "Emperor," instead of *Tien-Chu*, "Lord of Heaven," and in particular the erection of inscribed tablets in the churches, on which these terms were made use of;¹ (2) in respect to the ceremonial offerings made in honour of Confucius, and of personal ancestors, which Ricci had recognized as merely "civil" observances; (3) the erection of tablets in honour of ancestors in private houses; and (4), more generally, sanction and favour accorded to ancient Chinese sacred books and philosophical doctrine, as not really trespassing on Christian faith.

Probably no European name of past centuries is so well known in China as that of *Li-ma-teu*, the form in which the name of our missionary (*Ri-cci Mat-teo*) was adapted to Chinese usage, and by which he appears in Chinese records.² The works which he composed in Chinese are numerous; a list of them (apparently by no means complete, however) will be found in Kircher's *China Illustrata*, and also in Abel Rémusat's *Nouveaux Mélanges Asiatiques* (ii. pp. 213-215). They are said to display an aptitude for clothing ideas in a Chinese dress very rare and remarkable in a foreigner. One of the first which attracted attention and reputation among Chinese readers was a Treatise upon Friendship, in the form of a dialogue containing short and pithy paragraphs; this is stated in the *De Expeditione* to have been suggested during Ricci's stay at Nan-chang by a conversation with the prince of Kien-ngan, who asked questions regarding the laws of friendship in the West.

In the early part of his residence at Peking, when enjoying constant intercourse with scholars of high position, Ricci brought out the *T'ien-chu shih-i*, or "Veritable doctrine of the Lord of Heaven," which deals with the divine character and attributes under eight heads. "This work," says Mr A. Wylie, "contains some acute reasoning in support of the propositions laid down, but the doctrine of faith in Christ is very slightly touched upon. The teachings of Buddhism are vigorously attacked, whilst the author tries to draw a parallel between Christianity and the teachings of the Chinese literati."

In 1604 Ricci completed the *Erh-shih-wu yen*, a series of short articles of moral bearing, but exhibiting little of the essential doctrines of Christianity. *Chi-jên shih pien* is another of his productions, completed in 1608, and consisting of a record of ten conversations held with Chinese of high position. The subjects are:—(1) Years past no longer ours; (2) Man a sojourner on earth; (3) Advantage of frequent contemplation of eternity; (4) Preparation for judgment by such contemplation; (5) The good man not desirous of talking; (6) Abstinence, and its distinction from the prohibition to take life; (7) Self-examination and self-reproof inconsistent with inaction; (8) Future reward and punishment; (9) Prying into futurity hastens calamity; (10) Wealth with covetousness more wretched than poverty with contentment. To this work is appended a translation of eight European hymns, with elucidations, written in 1609.

Some of the characteristics briefly indicated here may have suggested, though probably they are far from justifying, the bitterness of attacks made upon Ricci's theology, long after he had been in his grave, by some of the opponents of the Jesuits in the controversies to which we have referred. An example of these is found in the work called *Anecdotes sur l'Etat de Religion dans la Chine*, Paris, 1733-35, the author of which (Abbé Villers) speaks of the *T'ien-chu shih-i* in this fashion—"The Jesuit was also so ill versed in the particulars of the faith that, as the holy bishop of Conon, Monsgr. Maigrot, says of him, one need merely read his book on the true religion to convince oneself that he had never imbibed the first elements of theology". . . . The writer goes on to say other things even much more bitter.

Ricci's pointed attacks on Buddhism, and the wide circulation of his books, called forth the opposition of the Buddhist clergy.

¹ Compare Browning, *The Ring and the Book*, x., The Pope, 1589-1603.

² The name comes forward prominently in the mouth of the emperor Kang-hi, in a dialogue which took place between him and Monsgr. Maigrot, the leader of the anti-Jesuit movement (mentioned in Browning's lines referred to above), at the summer residence in Tartary, August 1706,—a dialogue which the Jesuits have reported with not a little malice:—

"Emperor. 'Tell me why do the people call me *Yan-sui* (10,000 years).' The Most Reverend (i.e., Maigrot), 'To express their desire for your Majesty's long life.' Emp. 'Good. You see, then, Chinese words are not always to be taken literally. We pay cult to Confucius and to the dead to express our respect for them. How is that inconsistent with your religion? When did it begin to be so? Is it since Ly-Mattheu's time? Hast thou ever read Ly-Mattheu?' The Most Reverend, turning to P. Parenin, whispers, 'Who's he?' and learning that it was P. Matteo Ricci, . . . answered the emperor: 'I have not read that book.' Emp. 'Ly-Mattheu and his fellows came hither some two centuries ago; and before their time China never heard anything of the Incarnation, anything of *Tien-chu*, who had not become incarnate in this part of the world. Why then, if it was lawful to call God *Tien* before Ly-Mattheu's time, should it be improper now?'—*Epistola de Eventu Apostolicæ Legationis, scripta a PP. Missionariis . . . ad Præpositum Generalem S. J.*, An. 1706, 1 Novembris.

One of the ablest who took their part was Chu-hang, a priest of Hang-chau, who had abandoned the literary status for the Buddhist cloister. He wrote three articles against the doctrine of the missionaries. These were brought to Ricci's notice in an ostensible tone of candour by Yu-chun-he, a high mandarin at the capital. This letter, with Ricci's reply, the three Buddhist declamations, and Ricci's confutation, were published in a collected form by the Christian Sen-Kwang-K'e.

Another work of Ricci's which attracted attention was the *Hsi-kuo fa*, or "Art of Memory as practised in the West." Ricci was himself a great expert in *memoria technica*, and astonished the Chinese by his performances in this line. He also wrote or edited various Chinese works on geography, the celestial and terrestrial spheres, geometry, and arithmetic.³ And the detailed history of the mission was drawn out by him, which after his death was brought home by P. Nicolas Trigault, and published at Augsburg, and in a complete form at Lyons a year later under the name *De Expeditione Christiana apud Sinas Suscepata, ab Soc. Jesu*, Ex P. Mat. Ricci ejusdem Societatis *Commentariis*, in which Trigault himself added a large amount of interesting matter respecting China and the Chinese.

Among the scientific works of his time which Ricci took with him into China, there was a fine set of maps, which at first created great interest, but disgust afterwards when the Chinese came to perceive the insignificant place assigned therein to the "Middle Kingdom," thrust, as it seemed, into a corner, instead of being set in the centre of the world like the gem in a ring. Ricci, seeing their dissatisfaction, set about constructing a map of the hemisphere on a great scale, so adjusted that China, with its subject states, filled the central area, and, without deviating from truth of projection, occupied a large space in proportion to the other kingdoms gathered round it. All the names were then entered in Chinese calligraphy. This map obtained immense favour, and was immediately engraved at the expense of the viceroy, and widely circulated.

In the accompanying cut we have endeavoured to realize this Jesuitical map, as we fear it must be called. The projection we have adopted is a perspective of the hemisphere,

as viewed from a point at the distance of one diameter from the surface, and situated on the production of the radius which passes through the intersection of 115° E. long. (Greenwich) with 30° N. lat. Something pretty near this must have been Li-ma-teu's projection. With a vertex much more distant the desired effect would be impaired, and with one nearer neither of the poles would be seen, whilst the exaggeration of China would have been too gross for a professed representation of the hemisphere.

The chief facts of Ricci's career are derived from Trigault; some contemporary works on the rites controversy have also been consulted; in the notice of Ricci's Chinese writings valuable matter has been derived from *Notes on Chinese Literature* by Mr A. Wylie,⁴ an indefatigable scholar, and perhaps our only contemporary who can speak of these from actual examination. The projection of the sphere by the present writer appeared in the (now defunct) *Geographical Magazine* for July 1874. A number of Ricci's letters are extant in the possession of the family, and access to them was afforded to Giuseppe La Farina, author of the work called *La China, considerata nella sua Storia*, &c., Florence, 1843, by the Marchese Amico Ricci of Macerata, living at Bologna (see vol. i. p. 112 sq.). La Farina's quotations contain nothing of interest. There is a curious Chinese account of Ricci published by Dr Breitschneider in the *China Review*, iv. 391 sq. (H. Y.)

RICCIARELLI, DANIELE (1509-1566), Italian artist, generally called, from the place of his birth, DANIELE DA

³ In the catalogue of the London Mission Library, Shanghai, 1857, we find the following entries:—"197. *Chi'ho yian pien*, Elements of Geometry (MS.). This is the first six books of Euclid, translated by Matthew Ricci and his disciple Sen-Kwang-K'e, 1607." "198. *T'ung-wen suan-chih*. Guide to Arithmetic, 9 vols. incomplete; this treatise was drawn up by Ricci, with the aid of his disciple Le-Chetsau, and published in 1613." "199. *Chi-jên shih pien*" (see above).

⁴ Shanghai and London, 1867.

VOLTERRA, was born in 1509, and studied painting under Razzi and Peruzzi. The young artist, settling in Rome, strove most unweariedly to attain eminence in his profession. No efforts were spared on his pictures. He proceeded with a careful slowness, attempting to reach his ideal by a close imitation of Michelangelo. It is even said that he sometimes in a difficulty had recourse to the more direct aid of that great master's own hand. The result of this earnest labour was that Ricciarelli obtained abundant encouragement. His constant friend, Michelangelo, recommended him on all possible occasions. He had the honour to beautify with works of art a chapel in the church of the Trinità, to paint in the Farnese Palace, to execute certain decorations in the Palazzo de' Medici at Navona, and to begin the stucco work and the pictures in the Hall of the Kings. Nor was he less highly patronized when, towards the close of his life, he turned his attention to statuary. His last work was a bronze horse intended for an equestrian statue of Henry II. of France. He died in 1566. The principal extant works of Ricciarelli are at Rome. These are a St John the Baptist in the picture gallery of the Capitol, a Saviour bearing the Cross in the Palazzo Rospigliosi, and a Descent from the Cross, his masterpiece, in the church of Trinità de Monti. There is also an Elijah at Volterra.

RICCOBONI, MADAME (1714-1792), whose maiden name was Marie Jeanne Laboras de Mézières, and who married and was deserted by an actor and author of little merit, was born at Paris in 1714. She herself was an actress, but did not succeed on the stage. She then took to novel writing and deserves a considerable place in the history of the sentimental novel. Her first work was the remarkable *Histoire du Marquis de Cressy* (1758). This was followed by *Milady Catesby*, *Fanny Butler* (both of them, as indeed are almost all her books, in letter form), *Ernestine* (sometimes thought her masterpiece), three series of *Lettres* in the names of *Adelaide de Dammartin* (often quoted as *Madame de Sancerre*), *Elizabeth Sophie de Vallière*, *Milord Rivers*, and others. These books were much admired, but brought their author little money. She obtained, however, a small pension from the crown, but the Revolution deprived her of it, and she died in 1792 in great indigence. Besides the works named she translated Fielding's *Amelia*, and tried a continuation (but not the conclusion sometimes erroneously ascribed to her) of Marivaux's unfinished *Marianne*.

All Madame Riccoboni's work is very clever, and there is real pathos in it. But it is among the most eminent examples of the "sensitivity" novel, of which no examples but Sterne's have kept their place in England, and that not in virtue of their sensibility. A still nearer parallel may be found in the work of Mackenzie. Madame Riccoboni is an especial offender in the use of mechanical aids to impressiveness—italics, dashes, rows of points, and the like. The principal edition of her complete works is that of Paris, 1818. The chief novels appear in a volume of Garnier's *Bibliothèque Amusante*, Paris, 1865.

RICE. According to Roxburgh the cultivated rice with all its numerous varieties has originated from a wild plant called in India Newaree or Nivara (*Oryza sativa*). It is said to grow on the borders of lakes in the Circars and elsewhere in India, and is also native in tropical Australia. The rice plant is an annual grass with long linear glabrous leaves, each provided with a long sharply-pointed ligule. The spikelets are borne on a compound or branched spike, erect at first but afterwards bent downwards. Each spikelet contains a solitary flower with two outer small glumes and two inner, larger and folded lengthwise, the outer one of the two rather larger and sometimes provided with an awn. Within these are six stamens, a hairy ovary surmounted by two feathery styles which ripens into the fruit (grain), and which is invested

by the husk formed by the persistent glumes. The cultivated varieties are extremely numerous, some kinds being adapted for marshy land, others for growth on the hill-sides. The cultivators make two principal divisions according as the sorts are early or late. Other subdivisions depend upon the habit of the plant, the presence or absence of an awn, the colour of the grain, and other particulars. Rice has been cultivated from time immemorial in tropical countries. According to Stanislas Julien a ceremonial ordinance was established in China by the emperor Chin-nung 2800 years B.C., in accordance with which the emperor sows the rice himself while the seeds of four other kinds may be sown by the princes of his family. This fact, joined to other considerations, induced Alphonse de Candolle to consider rice as a native of China. It was very early cultivated in India, in some parts of which country, as in tropical Australia, it is, as we have seen, indigenous. It is not mentioned in the Bible, but its culture is alluded to in the Talmud. There is no evidence of the existence of rice in Egyptian remains, nor is there any trace of it as a native plant among the Greeks, Romans, or ancient Persians. There is proof of its culture in the Euphrates valley and in Syria four hundred years before Christ. Crawford on philological grounds considers that rice was introduced into Persia from southern India. The Arabs carried the plant into Spain under the name "aruz," the *arros* of the Spanish, the *rizo* of the Italian, whence our word rice. Rice was first cultivated in Italy near Pisa in 1468. It was not introduced into Carolina until 1700, and then, as it is said, by accident, although at one time the southern United States furnished a large proportion of the rice introduced into commerce. Rice, says Crawford, sports into far more varieties than any of the corns familiar to Europeans, for some varieties grow in the water and some on dry land; some come to maturity in three months, while others take four and six months to do so. The Hindus, however, are not content with such broad distinctions as might be derived from these obvious sources, but have names for varieties the distinctions between which are unappreciable by Europeans; besides terms for this corn founded on variety, on season, and on mode of culture, the grain itself bears one name in the straw, another when threshed, one name in the husk and another when freed from it, and a fifth when cooked. A similar abundance of terms is found in the languages of the Malay and Philippine Islands. Such minute nomen-

Rice (*Oryza sativa*).

A, spikelet (enlarged); B, bearded variety; C, spikelet of B (enlarged).

Such minute nomen-

clatures seem to point to a great antiquity in the culture of this cereal.

Rice constitutes one of the most important articles of food in all tropical and subtropical countries, and is one of the most prolific of all crops. The rice yields best on low lands subject to occasional inundations, and thus enriched by alluvial deposits. An abundant rainfall during the growing season is also a desideratum. Rice is sown broadcast, and in some districts is transplanted after a fortnight or three weeks. No special rotation is followed; indeed the soil best suited for rice is ill adapted for any other crop. In some cases little manure is employed, but in others abundance of manure is used. No special tillage is required, but weeding and irrigation are requisite. Rice in the husk is known as "paddy." On cutting across a grain of rice and examining it under the microscope, first the flattened and dried cells of the husk are seen, and then one or two layers of cells elongated in a direction parallel to the length of the seed, which contain the gluten or nitrogenous matter. Within these, and forming by far the largest part of the seed, are large polygonal cells filled with very numerous and very minute angular starch grains. Rice is not so valuable as a food as some other cereals, inasmuch as the proportion of nitrogenous matter (gluten) is less. Paven gives only 7 per cent. of gluten in rice as compared with 22 per cent. in the finest wheat, 14 in oats, and 12 in maize. The percentage of potash in the ash is as 18 to 23 in wheat. The fatty matter is also less in proportion than in other cereals. Rice, therefore, is chiefly a farinaceous food, and requires to be combined with fatty and nitrogenous substances, such as milk or meat gravy, to satisfy the requirements of the system.

The imports of rice into the United Kingdom range from 7,000,000 cwt. to 8,000,000 cwt. annually, having an estimated value of from £3,000,000 to £3,500,000. Nearly the whole of this comes from British Burmah and Bengal. A large proportion of the rice brought to Europe is used for starch-making, and some is taken by distillers of alcohol. Rice is also the source of a drinking spirit in India, and the national beverage of Japan—saké—is prepared entirely from the fermented grain.

RICE PAPER. The substance which has received this name in Europe, through the mistaken notion that it is made from rice, consists of the pith of a small tree *Aralia papyrifera* cut into thin slices. The tree grows in the swampy forests of Formosa and apparently nowhere else, and large quantities of the stems are conveyed to Chin-chew, where the snow-white delicate pith is carefully sliced by spiral cuts into uniform sheets of a fine ivory-like texture. It is dyed various colours, and extensively used for the preparation of artificial flowers, while the white sheets are employed by native artists for water-colour drawings.

RICH, CLAUDIUS JAMES (1787–1821), Eastern traveller and scholar, was born near Dijon, March 28, 1787. While still an infant he was taken to Bristol, where he spent his youth. At a very early age he developed a wonderful capacity for the acquisition of languages, soon becoming familiar not only with Latin and Greek but also with Hebrew, Syriac, Persian, Turkish, and other Eastern tongues. His unusual intelligence and extraordinary acquirements in Oriental languages procured for him in 1803 a nomination to a writership in the Bombay establishment of the East India Company. In 1804 Rich proceeded to Constantinople, where, and at Smyrna, he stayed a considerable time, perfecting himself in the Turkish language. Proceeding to Alexandria as assistant to the British consul-general there, he devoted himself to Arabic and its various dialects, and made himself master of Eastern manners and usages. On leaving Egypt he proceeded by land to the Persian Gulf, disguised as a Mameluke, visiting Damascus, and entering the great mosque undetected. At Bombay, which he reached in September 1807, he was the guest of Sir James Mackintosh, whose eldest daughter he married in January 1808, proceeding soon after to Baghdad as resident. While gaining the respect of Turks of all classes, as well as of Europeans, he now began his investigations into the geography, history, and antiquities of the vastly interesting region in the midst of which he was

placed, the results of which give him a high place among Eastern students. He made collections of all kinds, visited and examined the remains of Babylon, and projected a geographical and statistical account of the pashalic of Baghdad. The results of his investigations at Babylon appeared first in the Vienna serial the *Mines de l'Orient*, and in 1815 in England, under the title *Narrative of a Journey to the Site of Babylon in 1811*. In 1839 this was republished by his widow, with Major Rennell's remarks upon it, and a second memoir by Rich in reference to these remarks, together with the narrative of a journey to Persepolis. In 1813–14 Rich spent some time in Europe, and on his return to Baghdad paid special attention to the geography of Asia Minor, and collected much information in Syrian and Chaldean convents concerning the Yezidis. He continued, too, to collect manuscripts of all kinds, his collections being probably the most extensive and valuable brought together by any private person up to that time. His collection of coins—Greek, Parthian, Sasanian, and Moslem—as well as of gems and engraved stones, was much enlarged. During this period he made a second excursion to Babylon, and in 1820 he undertook an extensive tour to Kurdistan—from Baghdad north to Sulimania, eastward to Sinna, then west to Nineveh, and thence down the Tigris to Baghdad. The narrative of this journey, which for the first time furnished accurate knowledge (from scientific observation) regarding the topography and geography of the region traversed, was published by his widow in 1836. It abounds with information on the country and the people, their history and traditions, the ruins and inscriptions met with, characterized by the profundity and thoroughness of the real scholar and trained observer. He visited many of the ancient Christian churches in Chaldæa, adding largely to his stock of manuscripts, including ancient Syrian and Chaldean versions of the Scriptures. In 1821 Rich went to Basora, whence he made an excursion to Shiraz, visiting the ruins of Persepolis and the other remains of antiquity in the neighbourhood. An account of these excursions is given in the posthumous publication referred to, which also contains many notes on Rich's collections and minor excursions as well as a brief memoir. At Shiraz he was struck down by cholera on October 5, 1821. His early death was a vast loss to Oriental investigation. The work he did accomplish was of great value for Eastern archæology and history.

RICHARD I (1157–1199), king of England, called even before his death "the Lion" or "Cœur de Lion," was the third son of Henry II. and Eleanor of Aquitaine. He was born, probably at Oxford, on September 8, 1157. When little more than eleven years old he was invested with the duchy of Aquitaine, and imbibed in southern France the spirit of the adventurer and the troubadour which characterized him through life. In 1173 he joined the league against Henry II., but when the rebellion was suppressed in 1174 he was pardoned by his father. Shortly afterwards he was affianced to Alice, the daughter of Louis VII. The death of his brother Henry in 1184 made Richard heir to the throne. From this time he was the centre of the disturbances which troubled the last five years of Henry II.'s reign. The pretext for his quarrel with his father was the refusal of the latter to allow the barons to do fealty to Richard as heir, and Henry's wish to transfer Aquitaine to his younger son John. War was for some time averted by the preparations for the third crusade, and Richard himself took the cross (1187). Next year, however, a quarrel between Richard and his neighbour the count of Toulouse led to the final breach. Philip, king of France, took advantage of this quarrel to invade Berri, whence he was driven out again by Richard, who so far was acting in concert with his father. A truce

was made between the two kings, and Philip used the opportunity to separate Henry from his son. In November 1188 Richard did homage to Philip for his French provinces, and the latter demanded that Henry should acknowledge him as heir. Henry hesitated, and Richard openly joined Philip. In the spring of 1189 the allies overran Maine and Touraine, and forced Henry, in a meeting at Colombières, to submit to their demands. Two days later Henry died at Chinon (July 6, 1189), and Richard became king of England.

Richard's reign falls into two equal divisions—the one comprising his crusade and captivity, the other his wars against Philip in France. On his father's death he was at once acknowledged as duke of Normandy and count of Anjou. On September 3, 1189, he was crowned with great pomp at Westminster. This is the first English coronation of which we have a full account, and the formalities then adopted have been followed with little alteration ever since. Richard at once set to work to collect funds for the crusade. He sold ecclesiastical and temporal offices, released the king of Scotland from the vassalage to which Henry II. had subjected him; and, having by these means and by taxation collected a large sum of money, he crossed to Calais on December 12. Soon afterwards he met Philip at St Remy and made a treaty with him for a joint crusade. On June 27, 1190, the two armies assembled at Vezelai, whence they marched together as far as Lyons. There Philip took the route to Genoa, while Richard went by Marseilles. Visiting Naples on the way, he landed at Messina on September 23, where he found the French army and his own fleet awaiting him. The two kings remained in Sicily during the winter. William II., king of Sicily, husband of Richard's sister Joanna, had died shortly before, and Tancred, nephew of William, had seized the throne. During the negotiations for the recovery of Joanna and her dowry, disturbances broke out which ended in Richard's forcing his way into Messina at the head of his army. His real enemy was, however, not Tancred, but Philip. The natural jealousy of the two kings grew into mutual hatred during their stay in Sicily, and Tancred informed Richard of French intrigues. In March 1191 Richard made a treaty with Tancred, and recognized him as king of Sicily. At the same time he repudiated Alice, Philip's sister, and betrothed himself to Berengaria of Navarre. Philip was the first to leave Sicily. He arrived at Acre early in April. On April 10 Richard set sail, and a month later reached Cyprus, where he married Berengaria (May 12). He then proceeded to conquer Cyprus, took Isaac Comnenus and his daughter prisoners, and set out again for the Holy Land, reaching Acre on June 8. Guy of Lusignan, who claimed the throne of Jerusalem, had besieged that fortress since 1189, but the Christian army was itself hemmed in by the forces of Saladin. Richard's arrival encouraged the besiegers, and on July 11 Acre surrendered. The two kings now settled the dispute between Guy of Lusignan and Conrad of Montferrat about the throne of Jerusalem and on August 3 Philip left the Holy Land. Saladin having failed to fulfil the terms on which Acre had surrendered, Richard ordered the massacre in cold blood of some three thousand Mohammedan prisoners. Soon afterwards he set out for Jaffa, and on the way thither won the battle of Arsuf. Having rebuilt Jaffa, he started for Jerusalem. About Christmas 1191 he arrived at Beit-nûba, within sight of the Holy City, but, owing to the reluctance or desertion of his French allies, he found it impossible to besiege it, and therefore withdrew to the coast. In April 1192, at the instance of his followers, he recognized Conrad as king of Jerusalem, indemnifying Guy with the crown of Cyprus. The murder of Conrad immediately afterwards

was laid, probably without sufficient ground, to the charge of Richard, who conferred the vacant throne on Henry, count of Champagne. Bad news from England now made him anxious to go home, but he resolved on one more attempt to save Jerusalem. He set out on June 4, arrived again within sight of the city, and again retired without venturing to attack. Jaffa, which had been taken by Saladin, was retaken on August 1. This was Richard's last exploit in the East. On September 1 he made a three years' truce with Saladin, on the basis of the *status quo*; and on October 9 he sailed for home, leaving behind him a name long remembered by the Saracens, but, beyond the capture of Acre, having accomplished none of the objects with which he set out.

Fearing to go through France, Richard sailed up the Adriatic, and made his way on foot, as a pilgrim and almost alone, to Erdburg near Vienna. Here he was discovered (December 21, 1192) by Leopold, duke of Austria, of whom, while at Ascalon, he had made a bitter enemy. After being confined for some time at Dürrenstein on the Danube, he was surrendered in March 1193 to the emperor Henry VI., who imprisoned him first at Trifels and afterwards at Worms. Legend was already rife about him, but the story of his discovery by Blondel only dates from the following century, and is of French origin. In order to liberate himself, Richard resigned his crown to Henry VI. as overlord of Christendom, promised to pay a yearly tribute, and received back the crown as a vassal of the emperor. At Easter a diet was held at Spire, at which Richard was charged with various misdoings,—the recognition of Tancred, the conquest of Cyprus, the murder of Conrad, even with the betrayal of the Holy Land to Saladin. He defended himself eloquently, and the charges were dropped. Shortly afterwards a treaty was made at Worms (July 29) for Richard's release on payment of a ransom of 150,000 marks, with other conditions. Great efforts were made in England to collect the money, two-thirds of which was paid over to Henry, hostages being given for the rest. Philip and John were able, however, by offers of money and other means, to induce the emperor to detain Richard till the following spring. At length he was liberated. On March 13, 1194, he set foot again in England. He found his dominions in great confusion owing to the intrigues of Philip and John. He rapidly made himself master of the castles which held out for John, and on April 17, 1194, he was crowned a second time. He then collected more money from the impoverished country for the rest of his ransom and for an expedition to France, and on May 12 left England again never to return. Philip retired before him; John submitted and was pardoned. For the remaining five years of his reign Richard kept up an intermittent struggle with Philip, a struggle marked by no great battles, and interrupted only by fruitless negotiations and truces which were never kept. Neither party was strong enough to inflict a severe blow upon the other. In the autumn of 1198 the war went decidedly against Philip, but in January 1199 a peace for five years was made, each side retaining what it held. Shortly afterwards Richard, while besieging the castle of Chaluz near Limoges, which was held against him by one of his vassals, was wounded by an arrow. He died on April 6, 1199, and was buried at Fontevraud. His brother John succeeded him.

In person Richard was tall, muscular, ruddy, with light brown hair. He was lavish, generous, and fearless; a skilful commander, but incapable of extensive combinations or far-reaching plans; more religious than his father or brothers, but equally vicious; a bad husband and a bad son, with much of the ferocity that characterized his race;

in fact, a typical representative of the faults as well as the virtues of the chivalry of his day. His reign was signalized by no great legal or administrative reform, and England owes him nothing but barren fame.

Stevenson; Pauli, *Geschichte von England*, vol. iii.; Stubbs, *Early Plantagenets*; Lingard, *History of England*, vol. ii. (G. W. P.)

RICHARD II. (1366–1400), king of England, the only son of Edward the Black Prince and Joan of Kent, was born at Bordeaux, April 13, 1366. He succeeded to the throne on the death of his grandfather Edward III., on June 21, 1377. He was crowned on July 16. During the first eleven years of his reign, Richard was in a position of tutelage. His uncles, John of Gaunt, duke of Lancaster, and Thomas, duke of Gloucester, were the most influential persons in the kingdom. The evils naturally inherent in a minority were intensified by war abroad, religious and social troubles at home, the existence of a turbulent nobility, and the intrigues and rivalries which broke up the royal house. Under the incapable rule of Lancaster, the southern coasts were ravaged by French fleets, the northern frontier was harried by the Scots, and the taxes collected for national purposes were wasted or embezzled. The weakness and unpopularity of the Government produced a ferment among the lower classes, which, aggravated by the heavy taxation of 1379 and 1380, culminated in the Peasants' Revolt of June 1381. This revolt gave Richard, then a lad of fifteen, his first opportunity of distinguishing himself. On June 14 he met the rebels at Mile End, and, by promising the abolition of villenage, induced the Essex contingent to return home. Next day he met the Kentish men at Smithfield. In the parley which followed, their leader, Wat Tyler, was killed. The mob were about to avenge his death when the young king, riding forward alone, calmed their irritation and induced them to follow him to Islington. Here a body of troops came to the king's aid, but Richard prevented a conflict, and persuaded the rioters to disperse. His presence of mind, extraordinary in one so young, not only saved his own life but averted a general disaster. In January 1382 he married Anne of Bohemia, daughter of the emperor Charles IV. Meanwhile the influence exerted by John of Gaunt was becoming more and more irksome to him. Charges of conspiracy brought against his uncle in 1384, though denied by Lancaster, so worked upon Richard that he attempted to seize him, but a reconciliation was soon afterwards effected. In 1385 the king led an expedition to Scotland. His refusal to allow the army to penetrate beyond Edinburgh is said to have caused another quarrel with the duke of Lancaster. The efforts made by Richard to form a party of personal adherents, in opposition to his uncles, are to be seen in the elevation of De Vere to the marquissate of Dublin and of De la Pole, the chancellor, to the earldom of Suffolk. After John of Gaunt's departure to Portugal (July 1386) the quarrel between the king's party and the opposition headed by Gloucester came to a head. Gloucester, supported by a strong majority in parliament, demanded the dismissal of the chancellor and the treasurer, to which Richard was obliged reluctantly to consent. The blow was followed up by the appointment of a committee of government which, like the baronial committee of 1258, practically superseded the monarchy. Richard submitted, but immediately set about making plans for the recovery of his authority. In November 1387 he

came to London in order to overthrow the committee, but was anticipated by Gloucester, who, with Henry of Derby and three others, "appealed," or impeached the king's chief adherents of high treason. The party in power always found it easy to manipulate the elections, and the parliament which met in February 1388 was altogether on the side of the "appellants." The leaders of the king's party were executed, banished, or imprisoned, and Gloucester won a complete triumph. He failed, however, to establish his power on a firm basis, and in May 1389 Richard threw off the yoke. On the ground that he was now of full age, he suddenly informed his council that he intended to rule alone. Gloucester made no resistance; the nation acquiesced; and Richard was at last really king.

Richard did not for some time abuse his power. The "appellants" were not punished, and even remained members of the council. William of Wykeham, however, became chancellor, and it was apparently by his advice and that of John of Gaunt, who returned to England in 1389, that Richard regulated his conduct. For eight years he ruled constitutionally. The country was at peace at home and abroad. In June 1394 the queen died. In October of the same year Richard went to Ireland and received the submission of some of the chiefs. He remained in Ireland till May 1395. Next year he concluded a twenty-five years' truce with France, and engaged to marry Isabella, the French king's daughter. In September 1396 he went to Calais and returned with his bride, a child of eight years old. This alliance seems to have encouraged Richard to carry out a stroke of policy which he had probably long contemplated. In July 1397 he suddenly seized the "appellants," Warwick, Arundel, and Gloucester. The parliament, which met in September, repealed the acts of 1386, and declared the "appellants" guilty of high treason. Arundel was executed, Warwick imprisoned. Gloucester died, probably by violence, in prison. Next year the parliament conferred on Richard tonnage and poundage for life, and delegated their authority to a committee of eighteen, practically chosen by the king, thus making him an absolute monarch. A reasonable conversation between Hereford and Norfolk, reported by the former, gave a pretext for the banishment of both. In February 1399 John of Gaunt died, and Richard seized the Lancaster estates, thus reducing Hereford to desperation. The latter at once began to prepare to recover his inheritance, and Richard, apparently ignorant of the danger, went over to Ireland (May 29), thus leaving the kingdom open to his rival. Henry landed in Yorkshire early in July, and rapidly collected an overpowering force. Richard returned to find Henry in possession of power and himself deserted by the nation. He surrendered to Henry at Flint (August 19) and was conveyed to London. On September 29 he executed a deed by which he resigned the crown. Next day the deed was read in parliament. Formal sentence of deposition was pronounced, and Henry claimed and received the crown. A month afterwards the late king was sentenced to perpetual imprisonment, and was removed to Pontefract. The conspiracy against Henry IV., which was discovered in January 1400, sealed Richard's fate. The manner of his death is unknown, but there can be little doubt that he died by violence. He is said to have been buried at Langley, February 14, 1400.

In person Richard was slight, fair-haired, beardless, with rounded face and elegant but rather feminine features. His character, a strange mixture of strength and weakness, courage and irresolution, indolence and energy, remains an enigma to the historian. He protected Wickliffe, encouraged Chaucer, and made a serious attempt to establish an absolute monarchy. His reign, whether we regard it from

the religious, the political, or the social point of view, is one of very great importance, and its history has as yet been by no means fully elucidated.

RICHARD III. (1452–1485), king of England, third son of Richard, duke of York, and Cicely Nevil, was born at Fotheringay on October 2, 1452. Having been sent out of England for safety on the death of his father in 1460, he was recalled next year by his brother Edward IV., who created him duke of Gloucester and appointed him lord high admiral. He remained faithful to his brother during the latter's reign, sharing in his flight in 1470, and aiding him on his return in the victories of Barnet and Tewkesbury. In 1474 he married Anne, daughter of the earl of Warwick and widow of Prince Edward. In 1482 he led an army into Scotland to aid the duke of Albany against James III., occupied Edinburgh and captured Berwick. On the death of Edward IV. (April 9, 1483) Richard at once made himself master of the situation by seizing Prince Edward, his nephew. Having assumed the title of Protector, he rapidly developed his plans for securing the crown. Under the pretext of a plot against his life, he seized and beheaded Hastings, Grey, and others (June 13), forced the queen mother to give up her younger son Richard, and, on June 26, 1483, assumed the crown. The children of Edward IV. were set aside on the plea that their father was illegitimate. On July 6 Richard was crowned king. Shortly afterwards it was publicly reported that the sons of Edward IV. were dead; their actual fate is to the present day unknown. In October 1483 the rebellion of the duke of Buckingham was put down; the duke himself was executed on November 2. A parliament which met in January 1484 acknowledged Richard as king, in return for which he assented to an Act abolishing benevolences. His only legitimate son, Edward, died on April 9, 1484, and in March 1485 the boy was followed by his mother. To strengthen his position Richard had made treaties with Scotland and Brittany (1484), and he now proposed to marry his niece Elizabeth. From this course, however, he was dissuaded. His short reign was mainly occupied in preparing to resist the invasion of Henry of Richmond. Unable to prevent Henry's landing (August 7, 1485), Richard met his rival in battle at Bosworth (August 22), and at the same moment lost his crown and his life.

Tradition is divided as to Richard's personal appearance, and the story of his deformity is possibly derived from Lancastrian malignity and from a misunderstanding of his nickname Crouchback. His courage, energy, and ability would have made a great and honoured name had not those qualities been matched by extreme ferocity and unscrupulousness, and perverted to an evil use by the turbulence of the time and his own nearness to the throne.

Gairdner, 1875; *Letters and Papers illustrative of the reigns of Richard III. and Henry VII.*, ed. Gairdner (Rolls Series); Sir T. More, *Histories of Edward V. and Richard III.*, 1556; H. Walpole, *Historic Doubts on Richard III.*, 1768; Gairdner, *Life and Reign of Richard III.*, 1878. (G. W. P.)

RICHARD, earl of Cornwall and king of the Romans (1209–1272), second son of John, king of England, and Isabella, was born at Winchester, January 5, 1209. In

1225 he undertook the government of Gascony. In 1240 he went on a crusade, returning in 1241, after concluding a treaty with the sultan of Egypt. In 1242 he accompanied his brother on his unsuccessful expedition to Poitou. In 1244 and 1246 we find him heading the parliamentary opposition against Henry III., and a few years afterwards he befriended Simon de Montfort against his accusers. When Henry went to France in 1253, Richard, together with the queen, acted as regent. He had already (1252) declined the pope's offer of the kingdom of Sicily, but in January 1257 he was elected emperor by a majority of the electors, and soon afterwards was crowned at Aix-la-Chapelle. In 1259 he returned to England and swore to observe the Provisions of Oxford. Next year he acted as peacemaker between Henry and the barons, and, after spending another year in Germany, he returned to England in 1263. It was largely owing to his mediation that the two parties submitted to the arbitration of Louis IX., but on the renewal of the civil war he took his brother's side. Taken prisoner at the battle of Lewes, he was kept in confinement by De Montfort for a year, but released after the battle of Evesham. One of his last known acts was his mediation between the earl of Gloucester and the king. In 1269 he went to Germany again for a short time, and returned to England to die at Kirkham in 1272. He was thrice married—(1) to Isabella, sister of the earl of Pembroke; (2) to Sancia, daughter of Raymond, count of Provence; (3) to Beatrice of Falkenstein.

RICHARD OF BURY. See AUNGERVILLE, RICHARD.

RICHARD OF CIRENCESTER (1335–1401), historical writer, was a member of the Benedictine abbey at Westminster, and his name ("Circestre") first appears on the chamberlain's list of the monks of that foundation drawn up in the year 1355. In the year 1391 he obtained a licence from the abbot to go to Rome, his design being to visit *limina Apostolorum*, and in this licence the abbot gives his testimony to Richard's perfect and sincere observance of religion for upwards of thirty years. In 1400 Richard was in the infirmary of the abbey, where his death took place in the following year. His only known extant work is *Speculum Historiale de Gestis Regum Angliæ*, 447–1066. The manuscript of this is in the university library at Cambridge, and has been edited for the Master of the Rolls by Professor John E. B. Mayor (2 vols., 1863–1869). It is in four books, and at the conclusion of the fourth book Richard expresses his intention of continuing his narrative from the accession of William I., and incorporating a sketch of the Conqueror's career from his birth. This design he does not, however, appear to have carried into effect. The value of the *Speculum* as a contribution to our historical knowledge is but slight, for it is mainly a compilation from Rodger Wendover, Geoffrey of Monmouth, William of Malmesbury, Florence, Asser, Henry of Huntingdon, and other writers; while even in transcribing these the compiler is guilty of great carelessness. He gives, however, numerous charters relating to Westminster Abbey, and also a very complete account of the saints whose tombs were in the abbey church, and especially of Edward the Confessor, with whose reign the fourth book is entirely occupied. The work was, notwithstanding, largely used by historians and antiquaries, until, with the rise of a more critical spirit, its value became more accurately estimated. Besides the *Speculum* Richard also wrote, according to the statement of William Woodford in his *Answer to Wickliffe* (Brown, *Fasciculus Rerum expetendarum*, p. 193), a treatise *De Officiis*; and there was formerly in the cathedral library

at Peterborough another tractate from his pen, entitled *Super Symbolum*. Of neither of these works, however, does any known copy now exist.

Of the *Speculum* the main value may be said to be of a negative character, in that it affords the most conclusive proof of the spuriousness of another work attributed to Richard and long accepted by the learned world as his. This was the *De Situ Britanniae*, an elaborate forgery relating to the antiquities of Roman Britain which first appeared at Copenhagen in the year 1757. It was printed along with the works of Gildas and Nennius, under the editorship of Charles Julius Bertram, professor of English in the academy of Copenhagen in the middle of the last century, with the following special title:—"Richardi Corinensis monachi Westmonasteriensis de situ Britanniae libri duo. E Codici MS. descriptis, Notisque et Indice adornavit Carolus Bertram."

This forgery was accepted as genuine by a well-known antiquary of the last century, Dr William Stukeley, and under the sanction of his authority continued for a long time to be regarded in the same light by numerous scholars and antiquaries. Among their number were Gibbon, John Whitaker, Richard Gough, and Lingard. On the other hand, critics of a later date, such as J. J. Conybeare, Dr Guest, Wex, Raine, and Woodward, from time to time gave expression, on various grounds, to a contrary conclusion. All doubt on the subject may, however, be held to have been effectually set at rest by the masterly and exhaustive exposure of the whole fraud drawn up by Professor Mayor in the preface to the edition above referred to of the *Speculum*. He has there not only demonstrated, from the external and internal evidence alike, the spuriousness of the whole treatise, but in a collation (extending to nearly a hundred pages) of numerous passages with corresponding passages in classical mediæval authorities, has also traced out the various sources from whence Bertram derived the terminology and the facts which he reproduced in the *De Situ*. "To say nothing," says Professor Mayor, "of antiquaries whose canons of criticism are so lax that they cite a supposed monk of 1400 A.D. as authority for events of 1000 B.C., we find a forger alike contemptible as penman, Latinist, historian, geographer, critic, imposing upon members of the Royal and Antiquarian Societies, and of the two ancient universities, of the youthful Society D. U. K., on the writers of Germany and Denmark, of England, and of Scotland,—the last bribed by the invention of Vespasiana." (J. B. M.)

RICHARD OF ST VICTOR (*ob.* c. 1173), a Scot by birth, was subprior of his convent in 1159 and prior in 1162, and was a friend of St Bernard, to whom some of his books are dedicated. The tendency of his mysticism has been characterized in vol. xvii. p. 132. Of his works, which embrace exegesis, moral and dogmatic subjects, and mystical contemplation, the first edition appeared at Paris in 1528, the best at Rouen in 1650.

RICHARDSON, SIR JOHN (1787–1865), naturalist, was born at Dumfries on November 5, 1787, and died near Grasmere on June 5, 1865. He became a surgeon in the navy in 1807, and is known by his share in the arctic explorations of Parry and Franklin, 1819–22 and 1825–26 (see *POLAR REGIONS*, vol. xix. p. 319), and in the Franklin search expedition of 1848–49 (*ib.*, p. 321), but especially by his *Fauna Boreali-Americana* (1829–37, 4 vols. 4to). He also wrote *Arctic Searching Expedition* (1851), and other works on the zoology of the Arctic regions. He was knighted in 1842.

RICHARDSON, SAMUEL (1689–1761), as the inventor or the accidental discoverer of a new literary form, the modern novel of domestic life and manners, is entitled to a more prominent place in history than his powers, whether of thought or style, would justify. He stumbled on novel writing by accident and late in life. The son of a Derbyshire joiner (born in 1689), he had been apprenticed at the age of seventeen to a London printer (Wilde of Stationers' Hall), had spent some years as a press reader or proof corrector—not a bad position for acquiring some knowledge of literature—had married his master's daughter, and acquired an extensive business, trying his hand occasionally in composition as a writer of prefaces and

dedications to the books that he printed. When he was near the age of fifty some bookseller friends of his, struck perhaps by the excellence of his letters, had suggested to him that he should compose a "familiar letter-writer"—"a little volume of letters, in common style, on such subjects as might be of use to those country readers who were unable to indite for themselves." Richardson improved upon the suggestion. As it happened, he had had a singular experience in the way of writing letters for others. When he was a boy of thirteen three young women who could not write had employed him to conduct their correspondence with their sweethearts, which he did, he tells us, much to the satisfaction of his employers and without betraying their confidence. It occurred to him, turning over the project of the booksellers in his mind, and reverting to this early experience, that he might tell a story in a series of letters which would serve equally well as models for letter-writing and at the same time cultivate the principles of virtue and religion in the minds of the youth of both sexes. Accordingly, the publication being for country readers, he chose a country girl, Pamela, in the service of a young squire Mr B. (Fielding afterwards expanded the initial to "Booby"), and made her relate in letters to her friends her experiences from day to day and week to week in very trying circumstances. Friends write to advise Pamela in her difficulties, and so the story is carried on with circumstantial minuteness, Pamela describing with the most careful elaboration every particular of what happens to her, and adding her own reflexions, surmises, and appeals for approbation and counsel. The natural effect of this method is that, if we have any sympathy with the heroine, we get intensely interested in her perplexities,—the very fullness of the details and the close truth to nature with which the novelist follows every turn in the girl's thoughts compelling us to read on. This effect was fully realized in days when the voluminous moralizing was more in harmony with the general taste than it is now, and the kind of thing was new and fresh. The success of *Pamela* was immediate and widespread, and extended at once far beyond the circle of country cousins for whom it was designed. It is said that ladies at Ranelagh Gardens were to be seen holding up one to another their copies of *Pamela* to show that they had in their possession the most popular book of the day. The industrious antiquary has cast doubt upon this anecdote, pointing out that Ranelagh Gardens were not open to the public till eighteen months after *Pamela* had begun to run through many editions. Vauxhall, however, was open if Ranelagh was not, and the incident may have been observed there. At any rate the fact expressed by the anecdote is true enough, that the novel was at once and universally popular. *Pamela*, the first of one long line of novels, was published in November 1740. In January 1741 the following appeared in the *Gentleman's Magazine*:—"Several encomiums on a series of *Familiar Letters*, published but last month, entitled *Pamela, or Virtue Rewarded*, came too late for this magazine, and we believe there will be little occasion for inserting them in our next, because a second edition will then come out to supply the demands of the country, it being judged in town as great a sign of want of curiosity not to have read *Pamela* as not to have seen the *French and Italian Dancers*." This testimony is hardly less quaint and significant than the accredited anecdote.

It was thus that this industrious prosperous printer, a stout, rosy, vain, precise little man, carrying himself with sensitive dignity, not at all the kind of man that might have been expected to be a fashionable novelist, stumbled in the natural course of his business upon a new species of composition for which he had an unsuspected genius.

the religious, the political, or the social point of view, is one of very great importance, and its history has as yet been by no means fully elucidated.

RICHARD OF BURY. See AUNGERVILLE, RICHARD.

RICHARD OF CRENCÆSTER (1335–1401), historical writer, was a member of the Benedictine abbey at Westminster, and his name ("Circestre") first appears on the chamberlain's list of the monks of that foundation drawn up in the year 1355. In the year 1391 he obtained a licence from the abbot to go to Rome, his design being to visit *limina Apostolorum*, and in this licence the abbot gives his testimony to Richard's perfect and sincere observance of religion for upwards of thirty years. In 1400 Richard was in the infirmary of the abbey, where his death took place in the following year. His only known extant work is *Speculum Historiale de Gestis Regum Angliæ*, 447–1066. The manuscript of this is in the university library at Cambridge, and has been edited for the Master of the Rolls by Professor John E. B. Mayor (2 vols., 1863–1869). It is in four books, and at the conclusion of the fourth book Richard expresses his intention of continuing his narrative from the accession of William I., and incorporating a sketch of the Conqueror's career from his birth. This design he does not, however, appear to have carried into effect. The value of the *Speculum* as a contribution to our historical knowledge is but slight, for it is mainly a compilation from Rodger Wendover, Geoffrey of Monmouth, William of Malmesbury, Florence, Asser, Henry of Huntingdon, and other writers; while even in transcribing these the compiler is guilty of great carelessness. He gives, however, numerous charters relating to Westminster Abbey, and also a very complete account of the saints whose tombs were in the abbey church, and especially of Edward the Confessor, with whose reign the fourth book is entirely occupied. The work was, notwithstanding, largely used by historians and antiquaries, until, with the rise of a more critical spirit, its value became more accurately estimated. Besides the *Speculum* Richard also wrote, according to the statement of William Woodford in his *Answer to Wickliffe* (Brown, *Fasciculus Rerum expetendarum*, p. 193), a treatise *De Officiis*; and there was formerly in the cathedral library

at Peterborough another tractate from his pen, entitled *Super Symbolum*. Of neither of these works, however, does any known copy now exist.

Of the *Speculum* the main value may be said to be of a negative character, in that it affords the most conclusive proof of the spuriousness of another work attributed to Richard and long accepted by the learned world as his. This was the *De Situ Britanniae*, an elaborate forgery relating to the antiquities of Roman Britain which first appeared at Copenhagen in the year 1757. It was printed along with the works of Gildas and Nennius, under the editorship of Charles Julius Bertram, professor of English in the academy of Copenhagen in the middle of the last century, with the following special title:—"Richardi Corinensis monachi Westmonasteriensis de situ Britanniae libri duo. E Codici MS. descriptis, Notisque et Indice adornavit Carolus Bertram."

This forgery was accepted as genuine by a well-known antiquary of the last century, Dr William Stukeley, and under the sanction of his authority continued for a long time to be regarded in the same light by numerous scholars and antiquaries. Among their number were Gibbon, John Whitaker, Richard Gough, and Lingard. On the other hand, critics of a later date, such as J. J. Conybeare, Dr Guest, Wex, Raine, and Woodward, from time to time gave expression, on various grounds, to a contrary conclusion. All doubt on the subject may, however, be held to have been effectually set at rest by the masterly and exhaustive exposure of the whole fraud drawn up by Professor Mayor in the preface to the edition above referred to of the *Speculum*. He has there not only demonstrated, from the external and internal evidence alike, the spuriousness of the whole treatise, but in a collation (extending to nearly a hundred pages) of numerous passages with corresponding passages in classical mediæval authorities, has also traced out the various sources from whence Bertram derived the terminology and the facts which he reproduced in the *De Situ*. "To say nothing," says Professor Mayor, "of antiquaries whose canons of criticism are so lax that they cite a supposed monk of 1400 A.D. as authority for events of 1000 B.C., we find a forger alike contemptible as penman, Latinist, historian, geographer, critic, imposing upon members of the Royal and Antiquarian Societies, and of the two ancient universities, of the youthful Society D. U. K., on the writers of Germany and Denmark, of England, and of Scotland,—the last bribed by the invention of Vespasiana." (J. B. M.)

RICHARD OF ST VICTOR (*ob. c. 1173*), a Scot by birth, was subprior of his convent in 1159 and prior in 1162, and was a friend of St Bernard, to whom some of his books are dedicated. The tendency of his mysticism has been characterized in vol. xvii. p. 132. Of his works, which embrace exegesis, moral and dogmatic subjects, and mystical contemplation, the first edition appeared at Paris in 1528, the best at Rouen in 1650.

RICHARDSON, SIR JOHN (1787–1865), naturalist, was born at Dumfries on November 5, 1787, and died near Grasmere on June 5, 1865. He became a surgeon in the navy in 1807, and is known by his share in the arctic explorations of Parry and Franklin, 1819–22 and 1825–26 (see POLAR REGIONS, vol. xix. p. 319), and in the Franklin search expedition of 1848–49 (*ib.*, p. 321), but especially by his *Fauna Boreali-Americana* (1829–37, 4 vols. 4to). He also wrote *Arctic Searching Expedition* (1851), and other works on the zoology of the Arctic regions. He was knighted in 1842.

RICHARDSON, SAMUEL (1689–1761), as the inventor or the accidental discoverer of a new literary form, the modern novel of domestic life and manners, is entitled to a more prominent place in history than his powers, whether of thought or style, would justify. He stumbled on novel writing by accident and late in life. The son of a Derbyshire joiner (born in 1689), he had been apprenticed at the age of seventeen to a London printer (Wilde of Stationers' Hall), had spent some years as a press reader or proof corrector—not a bad position for acquiring some knowledge of literature—had married his master's daughter, and acquired an extensive business, trying his hand occasionally in composition as a writer of prefaces and

dedications to the books that he printed. When he was near the age of fifty some bookseller friends of his, struck perhaps by the excellence of his letters, had suggested to him that he should compose a "familiar letter-writer"—"a little volume of letters, in common style, on such subjects as might be of use to those country readers who were unable to indite for themselves." Richardson improved upon the suggestion. As it happened, he had had a singular experience in the way of writing letters for others. When he was a boy of thirteen three young women who could not write had employed him to conduct their correspondence with their sweethearts, which he did, he tells us, much to the satisfaction of his employers and without betraying their confidence. It occurred to him, turning over the project of the booksellers in his mind, and reverting to this early experience, that he might tell a story in a series of letters which would serve equally well as models for letter-writing and at the same time cultivate the principles of virtue and religion in the minds of the youth of both sexes. Accordingly, the publication being for country readers, he chose a country girl, Pamela, in the service of a young squire Mr B. (Fielding afterwards expanded the initial to "Booby"), and made her relate in letters to her friends her experiences from day to day and week to week in very trying circumstances. Friends write to advise Pamela in her difficulties, and so the story is carried on with circumstantial minuteness, Pamela describing with the most careful elaboration every particular of what happens to her, and adding her own reflexions, surmises, and appeals for approbation and counsel. The natural effect of this method is that, if we have any sympathy with the heroine, we get intensely interested in her perplexities,—the very fulness of the details and the close truth to nature with which the novelist follows every turn in the girl's thoughts compelling us to read on. This effect was fully realized in days when the voluminous moralizing was more in harmony with the general taste than it is now, and the kind of thing was new and fresh. The success of *Pamela* was immediate and widespread, and extended at once far beyond the circle of country cousins for whom it was designed. It is said that ladies at Ranelagh Gardens were to be seen holding up one to another their copies of *Pamela* to show that they had in their possession the most popular book of the day. The industrious antiquary has cast doubt upon this anecdote, pointing out that Ranelagh Gardens were not open to the public till eighteen months after *Pamela* had begun to run through many editions. Vauxhall, however, was open if Ranelagh was not, and the incident may have been observed there. At any rate the fact expressed by the anecdote is true enough, that the novel was at once and universally popular. *Pamela*, the first of one long line of novels, was published in November 1740. In January 1741 the following appeared in the *Gentleman's Magazine*:—"Several encomiums on a series of *Familiar Letters*, published but last month, entitled *Pamela, or Virtue Rewarded*, came too late for this magazine, and we believe there will be little occasion for inserting them in our next, because a second edition will then come out to supply the demands of the country, it being judged in town as great a sign of want of curiosity not to have read *Pamela* as not to have seen the *French* and *Italian* Dancers." This testimony is hardly less quaint and significant than the accredited anecdote.

It was thus that this industrious prosperous printer, a stout, rosy, vain, precise little man, carrying himself with sensitive dignity, not at all the kind of man that might have been expected to be a fashionable novelist, stumbled in the natural course of his business upon a new species of composition for which he had an unsuspected genius.

The fame of *Pamela* made him a great personal favourite, especially with women, of whose hearts and fancies he had shown a knowledge so intimate. Several ladies of quality made a pet of him, deluged him with questions and confidences, and urged him to write more. Under this flattering encouragement, the sedate author, still keeping his head and following his own plans amidst a multitude of counsellors, produced *Clarissa Harlowe* (1749), a model of every virtue in higher life, and *Sir Charles Grandison* (1753), his ideal of a perfect gentleman. *Clarissa* is universally acknowledged to be his masterpiece. An anecdote was given by Macaulay which shows how entrancing the story may become to readers once fairly caught by the current of it. He took the whole eight volumes with him, when he was in India, to a hill station during the hot season, and one day lent the first volume to the governor's wife. She read it and lent it to the governor's secretary, and went to Macaulay for the second. Thus all the eight volumes passed from hand to hand, and for a week or more the whole station was in a ferment over the fortunes of *Clarissa*, the readers anxiously waiting their turn for the successive volumes. Richardson is long-winded and prolix to a degree; but that, in spite of all his faults, he had the art of interesting his own generation was abundantly proved, and apparently his greatest novel is still capable in favourable circumstances of exerting its spell.

Richardson has long received the honour of being regarded as the founder of the English novel, but of late it has been customary to go a little farther back and trace the beginnings of the novel in the papers of Addison and Steele in the *Tatler* and the *Spectator*. The novel, it is said, was developed, not created, by Richardson. Now this is hardly fair to the ingenious printer, if it is meant to deny him any of the credit generally given to originators of new forms in literature. It is true that the novel was developed and not created, but it is not more true of Richardson's novel than of any other new species of composition, such as Marlowe's tragedy, or Scott's romantic tale, or Byron's personal epic. All alike are not created but developed in this sense that they have strongly marked affinities with kinds of writing immediately anterior to them. Thus in the novel of manners there are two elements—there is description of ordinary character, and there is plot-interest, *i.e.*, there is a story. Both of these elements are found in the generation before Richardson. But not in combination. It was he that combined them in his novel of manners, and therefore he is entitled to the praise of being the father of a new species of composition. There is abundance of description of manners in the *Spectator* and there are many delicate studies of character. And the general reader in the days of Queen Anne and of George I. had abundance of stories to choose from—tales of scandal, of crime, of high-flown romance. But it had not occurred to anybody before Richardson to make a heroine out of such a character as Jenny Simper, or a hero out of her baronet Sir Anthony Love, or a story out of incidents within the probabilities of ordinary life. The epistolary form in which his stories were cast, and which remains as a memorial of their first suggestion, was abandoned by Richardson's first great follower and satirist, Fielding; but it was Richardson that led the way into the new field of literature. He lived long enough to see many imitators. Within twelve years of the publication of *Pamela*, the *Monthly Review* began to complain of the labour of reading the multitude of novels submitted to its judgment, and the masterpieces of Fielding, Smollett, and Sterne were produced before his death in 1761. His correspondence was published in six volumes in 1804. (W. M.)

RICHELIEU, ARMAND DU PLESSIS, CARDINAL DE (1585–1642), the greatest French statesman of the 17th century. As the chief events of his life have been recorded in connexion with the sketch of his political career in the article **FRANCE** (vol. ix. pp. 567–570), it only remains briefly to mention here some matters of secondary importance. In the early days of his courtiership when he retired for a time to Avignon Richelieu wrote two religious works which attained to considerable popularity—*Principaux points de la foy deffendus contre l'escrit adressé au roy par les quatre ministres de Charenton* (1617), and *La méthode la plus facile et assurée de convertir ceux qui sont séparés de l'Église* (Paris, 1651). After he became master of France, his desire for distinction as a

man of letters and especially as a dramatic author led him to resort to various devices that were as undignified and ludicrous as they were high-handed and arbitrary. In the life of Corneille it has already been told how he employed "five poets" to "wash his dirty linen" (as Voltaire described the similar service he rendered to Frederick the Great), and how he attempted to revenge himself on Corneille, the greatest of the five, by causing the French Academy to pass a hostile verdict on the *Cid*. Even this high treason against art may perhaps be forgiven in consideration of the practical services the cardinal rendered to the cause of literature. *Les Thuilleries, La Grande Pastorale, Mirame*, and the other plays, over whose fate he trembled as over the result of an embassy or a campaign, have long been forgotten; but a permanent interest attaches to his *Mémoires* and correspondence (though owing to his way of working with substitutes and assistants it has been a difficult task to settle how much of what passes under his name is authentic):—*Mémoire d'Armand du Plessis de Richelieu, évêque de Luçon écrit de sa main, l'année 1607 ou 1610, alors qu'il méditait de paraître à la cour*, edited by Armand Baschet, 1880; *L'Histoire de la Mère et du Fils*, (*i.e.*, of Mary de' Medici and Louis XIII.), Amsterdam, 1730, extending from 1610 to 1624, frequently attributed to Mézeray; *Mémoires* from 1624–1638, published in Petitot's collection (Paris, 1823); *Journal de M. le Cardinal de Richelieu, 1630–1631* (Amsterdam, 1664, 2 vols.); *Testament politique du Cardinal de Richelieu* (Paris, 1764); *Les lettres, instructions diplomatiques, et papiers d'état du Cardinal de Richelieu*, collected and edited by M. Avenel, and forming five volumes of the *Collection de documents inédits sur l'histoire de France* (Paris, 1853–56).

Besides the older works of Aubery (1680) and Leclerc (1694) see A. Jay, *Hist. du ministère de Richelieu*, 1815; Capefigue, *Richelieu, Mazarin, la Fronde, &c.*, 1844; Caillet, *L'administration en France sous Richelieu*, 1860; Martineau, *Le Cardinal de Richelieu*, 1865; Topin, *Louis XIII. et Richelieu*, 1877; Sainte-Beuve, *Causeries du lundi*, vol. vii.

RICHELIEU, LOUIS FRANÇOIS ARMAND DU PLESSIS, DUC DE, marshal of France and grand-nephew of Cardinal Richelieu, was born in Paris, 13th March 1696, and died in the same city 8th August 1788. Besides his reputation as the most scandalous Lovelace of a scandalous age, he attained, in spite of a deplorably defective education, distinction as a diplomatist and general. As ambassador to Vienna (1725–1729) he settled in 1727 the preliminaries of peace; in 1745 he helped to gain the victory of Fontenoy; three years afterwards he made a brilliant defence of Genoa; in 1756 he expelled the English from Minorca by the capture of the San Felipe fortress; and in 1757–1758 he closed his military career by those pillaging campaigns in Hanover which procured him the sobriquet of *Petit Père de la Maraude*. In his early days he was thrice imprisoned in the Bastille,—in 1711 at the instance of his stepfather, in 1716 in consequence of a duel, and in 1719 for his share in Alberoni's conspiracy against the Pope. He was thrice married: first, against his will, at fourteen to Mademoiselle de Noailles; secondly, in 1734, by the intrigues (according to the witty Frenchman's own account) of Voltaire, to Mademoiselle de Guise; and thirdly, when he was eighty-four years old, to an Irish lady. Marshal Richelieu's *Mémoires* published by Soulavie in nine volumes (1790) are partially spurious.

RICHELIEU, ARMAND EMMANUEL DU PLESSIS, DUC DE (born 25th September 1766, died 17th May 1822), grandson of the marshal, is remembered mainly as the enlightened and heroic governor of Odessa (1803–1813) who guided the city through the terrible years of the plague, and as the minister of foreign affairs under Louis

XVIII. to whom it fell to sign the treaty of 1815. A pension of 50,000 francs, voted to him by the two chambers, he bestowed on the public charities of Bordeaux.

RICHERUS, a chronicler of the 10th century, son of Rodulf, a trusty councillor and captain of Louis IV., studied at Rheims under Gerbert, afterwards Pope Silvester II. His intimacy with this famous man gave him many opportunities of knowing the history of his time, and when Gerbert became archbishop of Rheims he charged Richerus with the task of writing a history of the Gauls. This history in four books begins with Charles the Fat and Eudes, and goes down to the year 995. From 969 onwards Richerus had no earlier history before him, and his work is the chief source for the period when the Capets superseded the Carolingians. It was first edited in Pertz's *Monumenta Germaniæ*, vol. iii., and there have since been several separate editions.

RICHMOND, a town of Surrey, is situated on the south bank of the Thames, here crossed by a stone bridge of five arches, $8\frac{1}{2}$ miles west of Hyde Park Corner by road, and $9\frac{3}{4}$ from the Waterloo station of the South-Western Railway. The town, anciently called *Syenes* and afterwards *Schene* and *Sheen*, until the name was in 1500 changed to Richmond by command of Henry VII., grew up round the royal manor house, which became a frequent residence of different sovereigns, but of which nothing more than a gateway now remains. Edward I. received the Scotch commissioners at his manor of Sheen in 1300. The palace was rebuilt by Edward III., who died there in 1377. It was frequently resided in by Richard II., and here his wife Anne of Bohemia died, upon which he cursed the place and "caused it to be thrown down and defaced." By Henry V. it was, however, rebuilt, and a great tournament was held at it in 1492 by Henry VII., who after its destruction by fire in 1499 restored it and named it Richmond. Henry VIII. gave it to Wolsey to reside in, after the latter presented him with the new palace of Hampton Court. James I. settled it on his son Henry, prince of Wales, who restored and embellished it at great expense. Charles I. added to it the new deer park generally known as Richmond Park, 2253 acres in extent, which is surrounded by a wall 11 miles in length. After the execution of the king, the parliament presented the park to the citizens of London, who again presented it to Charles II. at the Restoration. Though partly dismantled, the palace was the residence of the queen dowager till 1665, and by James II. it was used as a nursery for the young prince; but, gradually falling into decay, it was, about 1720, parcelled into tenements. In the old deer park extending northwards from the site of the palace towards Kew an observatory was erected in 1769, occupying the site of a Carthusian convent founded by Henry V., and a dwelling house in which Swift for some time resided. To the south-east of the town, at the entrance to Richmond Park, is Richmond Hill, from which is the famous view of the Thames with the surrounding country to the west. The White Lodge in Richmond Park is usually the residence of some member of the royal family. The town itself is without special interest, and consists chiefly of one long and irregular street running north and south. The church of St Mary Magdalen is of considerable antiquity, but has been almost entirely rebuilt; it contains a large number of monuments to celebrated persons. The theatre, first established in 1719, was during his later years leased by Edmund Kean. The town has a Wesleyan theological college founded in 1834, a free public library, and public baths. The population of the urban sanitary district (area 1210 acres) in 1871 was 15,113, and in 1881 it was 19,066.

RICHMOND, a borough in the North Riding of Yorkshire, is finely situated on the Swale, at the terminus of the Richmond branch of the North-Eastern Railway, 44 miles north-west of York and 15 south-west of Darlington. The interest of the town centres in the castle, said to have been founded by Alan Rufus, son of Hoel, count of Bretagne, who is also said to have rebuilt the town on his obtaining the estates of the Saxon Earl Edwin, embracing two hundred manors of Richmond and extending over nearly a third of the North Riding. When Henry VII. came to the throne these possessions reverted to the crown. Henry VIII. gave it to his son Henry by a daughter of Sir John Blount, and Charles II. bestowed the title of duke of Richmond on his son by the duchess of Portsmouth. The castle is situated on a perpendicular rock rising about 100 feet above the Swale, and from its great strength was considered inaccessible. Originally it covered an area of 5 acres, but the only portions of it now remaining are the Norman keep, with pinnacled tower and walls 100 feet high by 11 feet thick, and some other smaller towers. A portion of it is now occupied by the North York Rifles militia. The old church of St Mary, chiefly in the Gothic style, though with some traces of Norman, has been restored under the direction of Sir Gilbert Scott. For the free grammar school founded by Elizabeth a Gothic building was erected in 1850, in memory of the Rev. James Tate, a former master. The tower of the Franciscan abbey founded in 1258 still remains. The chief modern buildings are the town-hall, the masonic hall, and the workmen's hall. The principal trade is in agricultural produce, but there are a paper mill and an iron and brass foundry. The town received its first charter from Elizabeth. Under the Municipal Corporations Act it is governed by a mayor, four aldermen, and twelve councillors. Up to 1885, when it ceased to be separately represented, Richmond was a parliamentary borough, returning two members till 1868, and one after that date. The population of the municipal borough (area 2520 acres) in 1871 was 4443, and in 1881 it was 4502.

RICHMOND, a city of the United States, the county seat of Wayne county, Indiana, is situated in a fine agricultural region on the east branch of the White Water River (a sub-tributary of the Ohio), 68 miles east of Indianapolis. It is an important railway junction, has a city park 135 acres in extent, manufactures machinery, agricultural implements, &c., and contains a public library (15,000 volumes), a museum, two theatres, and two educational institutions (Earlham College, 1859) belonging to the Society of Friends, which is strongly represented in the city. The population was 9445 in 1870, and 12,742 in 1880. The city obtained its charter in 1845.

RICHMOND, a city of the United States, the capital of Virginia, is situated in Henrico county, on the north side of the James River, at the point where the lower falls (100 feet in 6 miles) mark the limit of the tide ascending from Chesapeake Bay. On the other side of the river, and in the county of Chesterfield, but connected with Richmond by bridges, is Manchester. By rail the city is 116 miles south-south-west of Washington. At mean high tides vessels drawing 14 feet of water can come up to Rocketts, as the lower district is called. The town proper occupies a group of hills—Gamble's Hill, Shockoe Hill, Church Hill, &c.—and looks down over the river, from which it is separated by a strip of flat ground. Main Street is a typical street after the old Southern style, the large portion burned in 1865 having been rebuilt in keeping with the remnant that escaped. By far the most conspicuous edifice in the city is the Capitol, on the summit of Shockoe Hill, designed by Thomas Jefferson, after the Maison Carrée of Nîmes. Beneath the dome of

the central hall stands Houdon's marble life-size statue of Washington in the uniform of a pre-Revolutionary American general, and in the esplanade near the west gates of Capitol Square is Crawford's famous bronze equestrian statue of the same hero (1858), surrounded by bronze figures of Patrick Henry, Thomas Jefferson, John Marshall, George Mason, Thomas Nelson, and Andrew Lewis. North of the Capitol stands Foley's bronze statue of General "Stonewall" Jackson, the gift of English admirers of that great Confederate leader. A governor's house, a State penitentiary, a custom-house and post office, a city-hall and almshouse, and two market-houses are among the principal public buildings. Libby prison, in which thousands of Federal prisoners were confined during the Civil War, was originally a disused tobacco factory, and is now scarcely distinguishable from the other dilapidated brick warehouses in its vicinity. St John's Episcopal church on Church Hill was, in 1775, the meeting-place of the Virginia convention to which Patrick Henry addressed his famous "Give me liberty or give me death," and in 1788 of another convention summoned to discuss the ratification of the Federal Constitution. Monumental Church (Episcopal) commemorates the disastrous burning in 1811 of the theatre which then occupied the site. The State Library, the Virginia Historical Society, Southern Historical Society, Richmond College, and the Medical College (1838) are institutions of note. Hollywood Cemetery, occupying a district of great natural beauty to the west of the city, contains the graves of thousands of Confederate soldiers and the monuments of President Monroe and General J. E. B. Stuart, and the Confederate soldiers' monument. Previous to the Civil War Richmond was the commercial capital of the South and a great entrepôt for the produce of the Southern States, Cuba, South America, and Great Britain. Its clipper ships made fast voyages to the Pacific for tea, silk, and other Eastern wares. Its auction sales (monthly or even fortnightly) drew buyers from every part of the Union, even from the northern cities which now supply it with the very commodities they then visited it to purchase. When the war was over Richmond was without ships, merchants, or capital. The tea trade had gone to London, the South-American to New York and Boston. In recent years, however, a new period of commercial prosperity appears to have set in, and, while several of the old sources of wealth have disappeared, the city still remains the natural centre of some of the principal trades of the South. Before the war more tobacco was sold in Richmond than perhaps in any city of the Union (fifty-six manufacturers were numbered in 1857), and this still remains an important staple. The flour trade is also of great extent. There are a large number of iron works, including those of the Tredegar Company; and granite quarries are worked in the vicinity of the city. In 1857 the real estate of Richmond was assessed at \$18,259,816, and the personal property at \$10,287,278. By 1885 the corresponding figures were \$34,502,903 and \$15,000,000. The city is the owner of both gas and water works. The population, which was only 5737 in the beginning of the century, has increased as follows:—9785 in 1810; 12,067 in 1820; 16,060 in 1830; 20,153 in 1840; 27,570 in 1850; 37,910 in 1860; 51,038 in 1870; 63,600 in 1880 (27,832 coloured).

The first settlement on part of the site of Richmond is said to date from 1609; and Fort Charles was erected as a defence against the Indians in 1644-45. But the real origin of the town, which was incorporated in 1746, was Byrd's warehouse, erected by Colonel William Byrd in the close of the 17th century. It was still a small village when in 1779 it was made the capital of the State of Virginia. From May 1861 till April 1865, when it was occupied by the Federal army, Richmond was the seat of government of the

Confederate States. On the capture of Petersburg by General Grant the Confederate leaders thought it impossible to hold the city, in spite of the strength of its fortifications; and Ewell, who commanded the rear-guard of the retreating army, set the great tobacco factories and flour-mills and the arsenal on fire; the conflagration lasted till the evening of the following day. In September 1870 part of the city was laid under water by the floods of the James river.

RICHMOND, LEGH (1772-1827), writer of tracts, was born 29th January 1772 at Liverpool, where his father was a physician. He was educated at Trinity College, Cambridge, where he graduated B.A. in 1794 and M.A. in 1797. In 1798 he was appointed to the joint curacies of Brading and Yaverland in the Isle of Wight. Through the perusal of Wilberforce's *Practical View* an evangelical bias was given to his mind, which led him to devote himself with great earnestness to the reclamation of the masses. He took a prominent interest in the British and Foreign Bible Society, the Church Missionary Society, and various other institutions of a similar kind. In 1805 he became chaplain to the Lock Hospital, London, and in the same year was presented to the rectory of Turvey, Bedfordshire, where he remained till his death, 8th May 1827. He was also appointed chaplain to the duke of Kent. The best known of the tracts of Legh Richmond is the *Dairyman's Daughter*, of which as many as four millions in nineteen languages were circulated before 1849. A collected edition of his tracts was first published in 1814 under the title of *Annals of the Poor*. He was also the author of *Domestic Portraiture*, and *Memoirs of his Three Children*; and he edited a series of the *Fathers of the English Church*.

See *Memoirs* by Grimshawe, 1828; *Life* by Bedell, 1829.

RICHTER, ERNST FRIEDRICH EDUARD (1808-1879), writer on musical theory and composition, was born at Grossschönau in Saxony, on October 24, 1808. He first studied music at Zittau, and afterwards at Leipsic, where he attained so high a reputation that in 1843 he was appointed professor of harmony and counterpoint at the conservatorium of music, then newly founded by Mendelssohn. On the death of Hauptmann, January 3, 1868, he was elected cantor of the Thomasschule, which office he retained until his death, April 9, 1879. He is best known by three theoretical works — *Lehrbuch der Harmonie*, *Lehre vom Contrapunct*, and *Lehre von der Fuge*—originally written for the use of his pupils at the Conservatorium, but now everywhere accepted as valuable text-books, and well known to English students through the excellent translation by Mr Franklin Taylor.

RICHTER, JOHANN PAUL FRIEDRICH (1763-1825), usually called JEAN PAUL, the greatest German humorist, was born at Wunsiedel, in Bavaria, on the 21st March 1763. His father was a schoolmaster and organist at Wunsiedel, but in 1765 he became a pastor at Joditz, and in 1776 at Schwarzenbach, where he died in 1779. Having attended the gymnasium at Hof for two years, Richter went in 1780 to the university of Leipsic. His original intention was to enter his father's profession, but theology did not interest him, and he soon devoted himself wholly to the study of literature. Unable to maintain himself at Leipsic, he secretly left it in 1784 and lived with his mother at Hof. From 1787 to 1789 he served as a tutor at Töpen, a village near Hof; and afterwards he taught the children of several families at Schwarzenbach. During all these years he had to struggle with extreme poverty, but he never lost the buoyancy of his temper, nor did he doubt for a moment that his genius would in the end be generally recognized. His hardships left no trace of bitterness on his frank and manly spirit.

Richter began his career as a man of letters by writing the *Grünländische Prozesse* and *Auswahl aus des Teufels*

Papieren, the former of which was issued in 1783–84, the latter in 1789. These works were not received with much favour, and in later life Richter himself had little sympathy with their satirical tone. His next book, *Die Unsichtbare Loge*, a romance, published in 1793, had all the qualities which were soon to make him famous, and its power was immediately recognized by some of the best critics of the day. Soon after the appearance of this book he abandoned his work at Schwarzenbach, and lived again with his mother at Hof, occasionally paying long visits to a friend at Baireuth. Encouraged by the reception of *Die Unsichtbare Loge*, he sent forth in rapid succession *Hesperus* (1794), *Biographische Belustigungen unter der Gehirnschale einer Riesin* (1796), *Leben des Quintus Fixlein* (1796), *Blumen-, Frucht-, und Dornenstücke, oder Ehestand, Tod, und Hochzeit des Armenadvocaten Siebenkäs* (1796–97), *Der Jubelseniör* (1797), and *Das Kampaner Thal* (1798). This series of writings secured for Richter a great place in German literature, and during the rest of his life every work he produced was welcomed by a wide circle of admirers.

After his mother's death he went in 1797 to Leipsic, and in the following year to Weimar, where he had much pleasant intercourse with Herder, by whom he was warmly appreciated. He did not become intimate with Goethe and Schiller, to both of whom his literary methods were repugnant; but in Weimar as elsewhere his remarkable conversational powers and his genial manners made him a favourite in general society. He was especially liked by women, and Frau von Kalb, who has also a place in the biography of Schiller, even offered to obtain a divorce in order to marry him. In 1801, however, he married Caroline Mayer, a bright, accomplished, and amiable lady whom he met in Berlin in 1800. They lived first at Meiningen, then at Coburg; and finally, in 1804, they settled at Baireuth. Here Richter spent a quiet, simple, and happy life, constantly occupied with his work as a writer. In 1808 he was fortunately delivered from anxiety as to outward necessities by the kindness of the prince primate, who gave him a pension of a thousand florins. Before settling at Baireuth, Richter had published *Das heimliche Klaglied der jetzigen Männer* (1801), and *Titan* (1800–3); and these were followed by *Flegeljahre* (1804–5). *Titan* and *Flegeljahre* he regarded as his masterpieces, and this judgment has been confirmed by posterity. His later imaginative works were *Dr Katzenberger's Badereise* (1809), *Des Feldpredigers Schmelze Reise nach Flütz* (1809), *Leben Fibels* (1812), and *Der Komet, oder Nikolaus Marggraf* (1820–22). In *Vorschule der Aesthetik* (1804) he expounded his ideas on art; he discussed the principles of education in *Levana, oder Erziehungslehre* (1807); and the opinions suggested by current events he set forth in *Friedenspredigt* (1808), *Dämmerungen für Deutschland* (1809), *Mars und Phöbus Thronwechsel im J. 1814* (1814), and *Politische Fastenpredigten* (1817). In his last years he began *Wahrheit aus Jean Paul's Leben*, to which additions from his papers and other sources were made after his death by C. Otto and E. Förster. In 1821 Richter lost his only son, a youth of the highest promise; and he never quite recovered from this shock. He died of dropsy on the 14th November 1825.

Schiller said of Richter that he would have been worthy of admiration "if he had made as good use of his riches as other men made of their poverty." And it is true that in the form of his writings he never did full justice to his great powers. In working out his conceptions he found it impossible to restrain the expression of any powerful feeling by which he might happen to be moved. He was equally unable to resist the temptation to bring in strange facts or notions which occurred to him; and of such facts and notions he had a vast store, for he was an omnivorous

reader, and forgot nothing that had ever touched his fancy or awakened his sympathies. Hence every one of his works is irregular in structure, and in some of them it is hard to detect the governing idea by which the relation of the parts to the whole is supposed to be controlled. His style, too, lacks directness, precision, and grace. With the main idea of a sentence he almost invariably associates a crowd of subordinate ideas; and they are often grouped in an order so capricious and so fantastic that the meaning can be made out only by the closest study. The splendour of Richter's genius, however, makes it easy for the class of readers to whom he appeals to forgive even these grave defects. His imagination was one of extraordinary fertility, and he had a surprising power of suggesting great thoughts by means of the simplest incidents and relations. No German prose writer has presented more fascinating pictures of childhood and youth, of friendship and love; nor has any one shown more finely how sordid circumstances may evoke the noblest qualities of loyal and generous minds. The love of nature was one of Richter's deepest pleasures, and he communicates his own delight in its beauty by many a description glowing with all the colour and the radiance of the real world. His expressions of religious feelings are also marked by a truly poetic spirit, for to Richter visible things were but the symbols of the invisible, and in the unseen realities alone he found elements which seemed to him to give significance and dignity to human life. His humour, the most distinctive of his qualities, cannot be dissociated from the other characteristics of his writings. It mingled with all his thoughts, and to some extent determined the form in which he embodied even his most serious reflections. That it is sometimes extravagant and grotesque cannot be disputed, but it is never harsh nor vulgar, and generally it springs naturally from the perception of the incongruity between ordinary facts and ideal laws. There are works of imaginative genius which we may read and enjoy without necessarily thinking of the author. The writer may reflect nature with so much fidelity that at first sight no element may seem to be imported into his conceptions from his personal peculiarities. But we appear always to see Richter's face and to hear his voice behind the printed page; and his creations are true and suggestive only in so far as they are manifestations of his own inward life. This means, of course, that his genius was not in any important sense dramatic, and that he was much more closely akin to the romantic than to the classic school; but it does not imply that his works produce a monotonous impression. Richter's personality was so deep and many-sided that in every new book he had some fresh secret to disclose. And the more he is known through his unconscious self-revelation the more he is loved and honoured; for we soon learn that with all his wilfulness and eccentricity he was a man of a pure and sensitive spirit, with a passionate scorn for pretence and an ardent enthusiasm for truth and goodness.

In 1826–38 a complete edition of Richter's works was published in sixty-five volumes, including several posthumous works. The second edition (1840–42) was in thirty-three volumes, the third (1860–65) in thirty-four. There are also a good many volumes of Richter's correspondence. See Döring, *Leben und Charakteristik Richters* (1826); Kunz, *Jean Paul Friedrich Richter* (1839); and Nerlich, *Jean Paul und seine Zeitgenossen* (1876). There are two admirable articles on Richter in Carlyle's *Miscellanies*.

RICIMER, created "comes" of the empire under Valentinian III, was the son of a chief of the Suevi, who had married a daughter of Wallia king of the Visigoths. He was brought up at Valentinian's court, and served with distinction under Aetius. In 456 a decisive naval victory over the Vandals off Corsica, followed soon afterwards by the defeat of their land forces near Agrigentum, earned for him the title of "Deliverer of Italy" and brought him within sight of the goal of his ambition. Having vanquished and deposed the emperor Avitus in October of that year, he for some time exercised every function of sovereignty over Italy under the title of "patrician," which he received from Leo in February 457. Precluded by his barbarian origin from aspiring to the imperial title, he consented to the elevation of Majorian in April 457, but, encouraged by the misfortunes of that brave but simple-minded soldier, he was equally ready to force his deposition four years afterwards (August 461). The puppet on whom the imperial dignity was now bestowed was Libius Severus, but Ricimer continued to command armies, negotiate alliances, and wield an independent and despotic authority over the Italian peninsula, although his power throughout the rest of the Western empire was practically neutralized by the influence of Marcellinus in Dalmatia and Ægidius in Gaul. When Anthemius, invested with the purple by Leo, arrived at

Rome in 467, Ricimer was politic enough to acquiesce with a good grace, and was rewarded by being made the son-in-law of the new emperor; but subsequently a quarrel with his father-in-law occasioned his withdrawal to Milan, whence he marched at the head of an army upon Rome, which he besieged and sacked, Anthemius being among the slain (July 11, 472). Olybrius was next made emperor at the instance of the Roman "kingmaker," who died of a malignant fever on August 18, 472.

RICKETS, a disease of childhood characterized chiefly by a softened condition of the bones and by other evidences of perverted nutrition. As regards its nature and causation rickets has been so fully considered under **PATHOLOGY** that all that appears now necessary is to give a few details as to its chief manifestations, and to refer briefly to some points in relation to its prevention and treatment.

Although, as already indicated, rickets may have its origin (at least in some instances) during intra-uterine life, it is seldom that it can be recognized until several months after birth, and it most commonly attracts attention at about the end of the first year. The symptoms which precede the outward manifestation of the disease are marked disorders of the digestive and alimentary functions. The child's appetite is diminished, and there is frequent vomiting together with diarrhoea or irregularity of the bowels, the evacuations being clay-coloured and unhealthy. Along with this there is a falling away in flesh. Importance is to be attached, as pointed out by Sir William Jenner, to certain other symptoms present in the early stages, namely, profuse sweating of the head and upper parts of the body, particularly during sleep, with at the same time dry heat of the lower parts and a tendency in the child to kick off all coverings and expose the limbs. At the same time there is great tenderness of the bones, as shown by the pain produced on moving or handling the child. The urine contains a large amount of calcareous salts. Gradually the changes in the shape of the bones become visible, at first chiefly noticed at the ends of the long bones, as in those of the arm, causing enlargements at the wrists, or in the ribs, producing a knobbed appearance at the junction of their ends with the costal cartilages. The bones also from their softened condition tend to become distorted and misshapen, both by the action of the muscles and by the superincumbent weight of the body. Those of the limbs are bent outwards and forwards, and the child becomes "bow-legged" or "in-kneed" often to an extreme degree. The trunk of the body likewise shows various alterations and deformities owing to curvatures of the spine, the flattening of the lateral curves of the ribs, and the projection forwards of the sternum. The cavity of the chest may thus be contracted and the development of the thoracic organs interfered with as well as their functions more or less embarrassed. The pelvis undergoes distortion, which may reduce its capacity to a degree that in the female may afterwards lead to serious difficulties in parturition. The head of the rickety child is large-looking in its upper part, the individual bones of the cranium sometimes remaining long ununited, while the face is small and ill-developed, and the teeth appear late and fall out or decay early. The constitutional conditions of ill-health continue, and the nutrition and development of the child are greatly retarded.

The disease may terminate in recovery, with more or less of deformity and dwarfing, the bones although altered in shape becoming firmly ossified, and this is the common result in the majority of instances. On the other hand, during the progress of the disease, various intercurrent ailments are apt to arise which may cause death, such as the infectious fevers, bronchitis and other pulmonary affec-

tions, chronic hydrocephalus, convulsions, laryngismus stridulus, &c.

An acute form of rickets of rare occurrence has been described by writers on diseases of children, in which all the symptoms are of more rapid development and progress, the result in many instances being fatal.

The treatment of rickets is necessarily more hygienic than medicinal, and includes such preventive measures as may be exercised by strict attention to personal health and nutrition on the part of mothers, especially where there appears to be any tendency to a rickety development in any members of the family. Very important also is the avoidance of too prolonged nursing, which not only tends directly to favour the development of rickets in the infant nursed, but by its weakening effects upon the mother's health is calculated to engender the disease in any succeeding children. At the same time it must be admitted that, when the mother is healthy, her milk abundant, and nursing discontinued before the lapse of the first year, there is no better means of preventing the occurrence of rickets than this method of feeding an infant, the disease, as is well known, being far more frequently met with in children brought up by hand. The management of the child exhibiting any tendency to rickets is of great importance, but can only be alluded to in general terms. The digestive disorders characteristic of the setting in of the disease render necessary the greatest care and watchfulness as to diet. Any one system of feeding the infant may at times be found to disagree, and may require to be changed or modified in some particulars. Thus, if the child be not nursed but fed artificially, milk, either fresh or condensed, should be almost the only article of diet for at least the first year, and the chief element for the next. When not digested well, as may at times be shown by its appearance as a curd in the evacuations, it may be diluted with water or lime water, or else discontinued for a short time, carefully-made gruel or barley water being substituted. Many of the so-called "infant's foods" which are now so extensively used appear to be well adapted for their purpose, but when employed too abundantly and to the exclusion of the due amount of milk are often productive of digestive and intestinal disorders, probably from their containing a greater amount of starchy matter than can be utilized. From the end of the first year light animal soups may occasionally be given with advantage. The medicinal remedies most to be relied on are those which improve the digestive functions and minister to nutrition, and include such agents as the preparations of iron, quinine, and especially cod-liver oil. The administration of lime salts in large quantity has been proposed by some physicians under the idea that in this way the deficient earthy matter might be supplied to the bones. M. Piorry recommended for this purpose powdered fresh bones which contain a large amount of phosphate of lime. No great success can be claimed for this plan, and it is generally recognized that the most useful method of treatment is that which is directed to the feeble assimilative powers, and seeks to supply food of a kind which will be at once readily digested and nutritious. Of no less importance, however, are abundance of fresh air, cleanliness, warm clothing, and attention to the general hygiene of the child and to regularity in all its functions.

When the disease is showing evidence of advancing, it is desirable to restrain the child from walking, as far as possible. But this precaution may be to some extent rendered unnecessary by the use of splints and other apparatus as supports for the limbs and body, enabling the child to move about without the risk of bending and deformity of the bones which otherwise would probably be the result.

(J. O. A.)

RICKMAN, THOMAS (1776–1841), architect and writer on the styles of the Middle Ages, was born in 1776 at Maidenhead, Berkshire, where his father practised as a surgeon, and was brought up as a member of the Society of Friends. In 1797 he was apprenticed to a London druggist as a step towards entering his father's profession, but finding the work distasteful he gave it up, and for several years tried one employment after another with little success. He married early, and lost his wife, who was his cousin, in 1808. At that time he was a partner in a corn-factor's business in London, but he afterwards went to live in Liverpool as assistant to an insurance broker, and was soon led to take a very keen interest in the study of ancient buildings, especially churches. All his spare time was spent in sketching and making careful measured drawings, till he gained a knowledge which was very remarkable at a time when but little taste existed for the beauties of the Gothic styles. In this way Rickman

was led to make designs of his own, founded upon his study of old examples; and, when a large grant of money was made by the Government to build new churches, he sent in a design of his own which was successful in an open competition; thus he was fairly launched upon the profession of an architect, for which his natural gifts strongly fitted him. Rickman then moved to Birmingham, and at first worked at his new profession with Mr H. Hutchinson as managing clerk; and when he died in 1830 Rickman entered into partnership with Mr Hussey, having become one of the most successful architects of his time. He built an immense number of churches, chapels, and other buildings, among which some of the chief are churches at Hampton Lucy, Ombersley, and Stretton-on-Dunsmore, St George's at Birmingham, St Philip's and St Matthew's both in Bristol, two in Carlisle, St Peter's and St Paul's at Preston, St David's in Glasgow, Grey Friars at Coventry, and many others. He also designed the new court of St John's College, Cambridge, a palace for the bishop of Carlisle, and several large country houses. These are all in the Gothic style, but, though superior perhaps to the buildings of his predecessors, they show more knowledge of the outward form of the mediæval style than any real acquaintance with its spirit, and are little better than dull copies of old work, disfigured by much poverty of detail. Rickmann nevertheless was an important stage in the revival of taste for mediævalism, perhaps in that respect only second to Pugin. His book entitled *An Attempt to Discriminate the Styles of Architecture in England* is a work which deserves great credit for its painstaking research; a great many editions of it were published, and it was eventually much improved and enlarged. Rickman died in 1841.

RIDDLES are probably the oldest extant form of humour. They spring from man's earliest perception that there are such things as analogies in nature. Man observes an example of analogy, puts his observations in the form of a question, and there is the riddle ready made. Some Boeotian humorist, for example, detected the analogy between the life of humanity—the child on all fours, the man erect on two legs, old age with its staff—on one side, and on the other the conception of an animal with a varying number of limbs. Put this in a question, and it is the riddle of the Sphinx. Another instance is the question—"What we caught we threw away, what we could not catch we kept." Homer is said to have died of vexation at not being able to discover the answer to this riddle, still current on the coast of Brittany, in Germany, and in Gascony. After inventing the riddle, men began to use it in a kind of game; bets were staked on the answer, and sides were made, each side backing its champion. These sports in Marriner's time were common in Tonga; they are no less popular among the African Woloffs. The example of Samson's riddle set to the Philistines is an instance of the sport in a Semitic country. In *mährchen* and ballads, the hero's chance of winning his beloved, or of escaping threatened punishment, is often made to turn on his power of answering riddles. It follows from the artless and primitive character of the riddle that regular popular riddles (*Devinettes*) are widely distributed, like popular tales, popular songs, and popular customs. The Woloffs ask, "What flies for ever and rests never?" Answer, The Wind. The Basutos put this riddle—"What is wingless and legless, yet flies fast and cannot be imprisoned?" Answer, The Voice. The German riddle runs—"What can go in face of the sun yet leave no shadow?" Answer, The Wind. In riddles may perhaps be noticed the animistic or personalizing tendency of early human thought, just beginning to be conscious of itself. The person who asked these riddles had the old sense of wind, for example,

as a person, yet probably, unlike the Bushmen, he would never expect to see the personal wind. He knew the distinction between the personal and impersonal well enough to be sure that his enigma would present some difficulty. The riddle, to be brief, is an interrogatory form of the fable, and like the fable originates among rude people, and is perpetuated in the folklore of peasantry.

Probably the best book on the riddle (a subject less frequently studied than the *mährchen* or the myth) is Eugène Rolland, *Devinettes ou Énigmes Populaires*, with a preface by M. Gaston Paris. The power of answering riddles among the people who invented the legend of Solomon and the queen of Sheba seems to have been regarded as a proof of great sagacity. The riddle proper is all but extinct outside folklore and savage life, and has been replaced by the conundrum, which is a pun in the interrogative form.

RIDING. See HORSEMANSHIP, vol. xii. p. 195.

RIDLEY, NICHOLAS (c. 1500–1555), bishop of London, and a martyr to the Reformation, was descended from a family long seated in Northumberland. The second son of Nicholas Ridley of Unthank near Willimoteswick in that county, he was born in the beginning of the 16th century. From the grammar school of Newcastle-upon-Tyne he was sent to Pembroke College, Cambridge, about 1518, being supported there by his uncle, Dr Robert Ridley, fellow of Queen's College. At the university he specially distinguished himself in Greek. He proceeded B.A. 1522–23, became a fellow of his college, and, having taken orders, was sent about 1527 at the expense of his uncle to study on the Continent, first at the Sorbonne, Paris, and afterwards at Louvain. On his return to Cambridge he was in 1530 chosen under-treasurer of the university; and in 1534 he was senior proctor, when along with the vice-chancellor and the other proctor Richard Wilkes he signed the decree of the university against the jurisdiction of the pope in England. About this time he began to distinguish himself as an orator and disputant, and was chosen chaplain of the university, and "Magister Glomeriæ,"—an office in which most probably (for its duties have been much disputed) he had to instruct the university entrants in Latin. Cranmer, archbishop of Canterbury, after Ridley had proceeded B.D. in 1537, appointed him one of his chaplains, and in April 1538 collated him to the vicarage of Herne, Kent, where he began to preach the doctrines of the Reformation. In 1540, having commenced doctor of divinity, he was made king's chaplain; and in the same year he was elected master of his college in Cambridge. Soon after he was appointed a canon of Canterbury. At the instigation of Bishop Gardiner he was accused in the bishop's court of preaching against the doctrine of the Six Articles, but after the matter had been referred to commissioners specially appointed by the king he was acquitted. In 1545 he renounced the doctrine of transubstantiation, and was made a canon of Westminster. In 1547 he was presented by the fellows of Pembroke Hall to the living of Soham, Cambridgeshire, and the same year was consecrated bishop of Rochester. In 1550 he was one of the commissioners for examining Bishops Gardiner and Bonner. He concurred in their deprivation, and succeeded the latter in the see of London. In 1552, returning from Cambridge, he paid a visit to the princess, afterwards Queen Mary, at Hunsdon, Hertfordshire. On account of her unqualified condemnation of the Reformed doctrines, he from this time concurred in the proposals to exclude her from the throne, and he signed the will of Edward VI. settling the crown on Lady Jane Grey. On the death of the king, he, in a sermon at St Paul's Cross, 16th July

1553, affirmed that Mary was illegitimate, and predicted that her accession would be disastrous to the religious interests of England. After the proclamation of Mary he set out for Framlingham to confess his offences against her, but was met with a warrant for his arrest and was committed to the Tower. In March 1554 he was sent down, along with Cranmer and Latimer, to Oxford to be tried before a committee of convocation. He was convicted of heresy, and after refusing to recant was sentenced to death. The trial having been declared irregular, he was, in September 1555, along with Cranmer and Latimer, tried by special commissioners, and on the 16th October he, in company with Latimer, was burnt at the stake at Oxford.

The collected edition of the works of Ridley, published in 1841 with a biographical notice by Rev. Henry Christmas, includes *A Treatise concerning Images in Churches*; *A brief Declaration of the Lord's Supper*; *Certain godly and comfortable Conferences between Bishop Ridley and Mr Hugh Latimer during their imprisonment*; *A Comparison between the comfortable Doctrine of the Gospel and the Traditions of the Popish Religion*; and a variety of other pamphlets. His life by his relative Dr Gloucester Ridley appeared in 1768. See also Foxe's *Acts and Monuments*; Strype's *Cranmer*; Burnet's *History of the Reformation*; Wood's *Athenæ Oxon.*; Cooper's *Athenæ Cantab.*; and Froude's *History of England*.

RIEMANN, GEORG FRIEDRICH BERNHARD (1826–1866), mathematician, was born on the 17th September 1826, at Breselenz, near Dannenberg in Hanover. His father Friedrich Bernhard Riemann came from Mecklenburg, had served in the war of freedom, and had finally settled as pastor in Quickborn. Here with his five brothers and sisters Riemann spent his boyhood and received, chiefly from his father, the elements of his education. He showed at an early age well-marked mathematical powers, and his progress was so rapid in arithmetic and geometry that he was soon beyond the guidance not only of his father but of schoolmaster Schulz, who assisted in the mathematical department of his training.

In 1840 he went to live with his grandmother at Hanover, where he attended the lyceum. After her death, two years later, he entered the Johanneum at Lüneburg, where he finished in four years more his gymnasial education. Notwithstanding some disadvantages due to defects in his earlier training, and more particularly to shyness arising from his rustic upbringing, he speedily distinguished himself in all the branches of the gymnasial course, and was already known by the school authorities as a mathematician of great promise. The director, Schmalfuss, encouraged him in his mathematical studies by lending him books (among them Euler's works and Legendre's *Theory of Numbers*), and readily understood that he had no ordinary schoolboy to deal with when he found that works of such profundity were read, mastered, and returned within a few days. In 1846, in his twentieth year, Riemann entered himself as a student of philology and theology in the university of Göttingen. This choice of a university career was dictated more by the natural desire of his father to see his son enter his own profession, and by the poverty of his family, which rendered the speedy earning of his living a matter of importance, than by his own preference. He sacrificed so far to the bent of his genius as to attend lectures on the numerical solution of equations and on definite integrals by Stern, on terrestrial magnetism by Goldschmidt, and on the method of least squares by Gauss. It soon became evident that his mathematical studies, undertaken at first probably as a relaxation, were destined to be the chief business of his life; and he obtained his father's permission to devote himself entirely to a scientific career. By this time he had exhausted the resources of Göttingen in the shape of mathematical lectures; and he proceeded in the beginning of 1847 to Berlin, attracted thither by that brilliant constellation of mathematical genius whose prin-

cipal stars were Dirichlet, Jacobi, Steiner, and Eisenstein. He appears to have attended Dirichlet's lectures on theory of numbers, theory of definite integrals, and partial differential equations, and Jacobi's on analytical mechanics and higher algebra. It was during this period that he first formed those ideas on the theory of functions of a complex variable which led to most of his great discoveries. One stirring social incident at least marked this part of his life, for, during the revolutionary insurrection in March 1848, the young mathematician, as a member of a company of student volunteers, kept guard in the royal palace from 9 o'clock on the morning of the 24th March till 1 o'clock on the afternoon of the following day.

In 1850 he returned to Göttingen and began to prepare his doctor's dissertation, busying himself meanwhile with "Naturphilosophie" and experimental physics. In pursuit of the latter he entered the mathematical and physical seminary, then newly started by Weber, Ulrich, Stern, and Listing. This double cultivation of his scientific powers, doubtless due more to the influence of Göttingen as represented by Gauss than to Berlin, had the happiest effect on his subsequent work; for the greatest achievements of Riemann were effected by the application in pure mathematics generally of a method (theory of potential) which had up to this time been used solely in the solution of certain problems that arise in mathematical physics.

In November 1851 he obtained his doctorate, the thesis being "Grundlagen für eine allgemeine Theorie der Functionen einer veränderlichen complexen Grösse." This memoir excited the admiration of Gauss, and at once marked its author's rank as a mathematician. The fundamental method of research which Riemann employed has just been alluded to; the results will be best indicated in his own words:—

"The methods in use hitherto for treating functions of a complex variable always started from an expression for the function as its definition, whereby its value was given for every value of the argument; by our investigation it has been shown that, in consequence of the general character of a function of a complex variable, in a definition of this sort one part of the determining conditions is a consequence of the rest, and the extent of the determining conditions has been reduced to what is necessary to effect the determination. This essentially simplifies the treatment of such functions. Hitherto, in order to prove the equality of two expressions for the same function, it was necessary to transform the one into the other, i.e., to show that both expressions agreed for every value of the variable; now it is sufficient to prove their agreement to a far less extent" [merely in certain critical points and at certain boundaries].

The time between his promotion to the doctorate and his habilitation as privat-docent was occupied by researches undertaken for his Habilitationsschrift, by "Naturphilosophie," and by experimental work partly as Weber's assistant in the mathematical physical seminary, and partly as collaborateur with Weber and Kohlrausch in special researches on electricity. In connexion with the results of Kohlrausch regarding the residual discharge of condensers, Riemann worked out a theory of this phenomenon which he intended to have published in *Poggendorff's Annalen*. For some reason not fully explained it was not published at all during his lifetime, and its place in the *Annalen* was taken by an elegant little paper on Nobili's rings.

The subject he had chosen for his Habilitationsschrift was the "Representation of a Function by means of a Trigonometrical Series," a subject which Dirichlet had made his own by a now well-known series of researches. It was fortunate no doubt for Riemann that he had the kind advice and encouragement of Dirichlet himself, who was then on a visit at Göttingen during the preparation of his essay; but the result was a memoir of such originality and refinement as showed that the pupil was fully the equal of the master. Of the customary three themes which he

suggested for his trial lecture, that "On the Hypotheses which form the Foundation of Geometry" was chosen at the instance of Gauss, who was curious to hear what so young a man had to say on this difficult subject, on which he himself had in private speculated so profoundly (see PARALLELS, vol. xviii. p. 254). Dedekind tells us that Riemann's lecture, which surpassed his utmost expectation, filled him with the greatest astonishment, and that on the way back from the faculty meeting he spoke to Wilhelm Weber with the highest appreciation, and with an excitement rare with him, regarding the depth of the thoughts to which Riemann had given utterance.

In 1855 Gauss died and was succeeded by Dirichlet, who along with others made an effort to obtain Riemann's nomination as extraordinary professor. In this they were not successful; but a Government stipendium of 200 thalers was given him, and even this miserable pittance was of great importance, so straitened were his circumstances. But this small beginning of good fortune was embittered by the deaths of his father and his eldest sister, and by the breaking up of the home at Quickborn, where he had so often found solace when ill and dejected. Meantime he was lecturing and writing the great memoir (*Borchardt's Journal*, vol. liv., 1857) in which he applied the theory developed in his doctor's dissertation to the Abelian functions. It is amusing to find him speaking jubilantly of the unexpectedly large audience of eight which assembled to hear his first lecture (in 1854) on partial differential equations and their application to physical problems. The rustic shyness which had troubled his schoolboyhood seems still to have haunted him; for he says, speaking of these lectures, "The nervousness which I had at first has pretty well subsided, and I accustom myself to think more of my hearers than of myself, and to read in their faces whether I may go on, or whether the matter requires further explanation."

Riemann's health had never been strong. Even in his boyhood he had shown symptoms of consumption, the disease that was working such havoc in his family; and now under the strain of work he broke down altogether, and had to retire to the Harz with his friends Ritter and Dedekind, where he gave himself up to excursions and "Naturphilosophie." After his return to Göttingen (November 1857) he was made extraordinary professor, and his salary raised to three hundred thalers. As usual with him, misfortune followed close behind; for he lost in quick succession his brother Wilhelm and another sister. In 1859 he lost his friend Dirichlet; but his reputation was now so well established that he was at once appointed to succeed him. It now seemed for a little as if the world was to go smoothly with him. Well-merited honours began to reach him; and in 1860 he visited Paris, and met with a warm reception there. He married, and married happily, Fräulein Elise Koch in June 1862, but the following month he had an attack of pleurisy which proved the beginning of a long illness that ended only with his death. His physician recommended a sojourn in Italy, for the benefit of his health, and Weber and Sartorius von Waltershausen obtained from the Government leave of absence and means to defray the cost of the journey. At first it seemed that he would recover; but on his return in June 1863 he caught cold on the Splügen Pass, and in August of the same year had to go back to Italy. In November 1865 he returned again to Göttingen, but, although he was able to live through the winter, and even to work a few hours every day, it became clear to his friends, and clearest of all to himself, that he was dying. He was very desirous to finish some of the many investigations which had presented themselves to him, and

eagerly asked his doctors to tell him how long he might reasonably expect to live, so that he might take up what he had most chance of finishing. In order to husband his few remaining days he resolved in June 1866 to return once more to Italy. Thither he journeyed through the confusion of the first days of the Austro-Prussian war, and settled in a villa at Selasca near Intra on Lago Maggiore. Here his strength rapidly ebbed away, but his mental faculties remained brilliant to the last. On the 19th of July 1866, attended by his wife, he lay under a fig-tree greatly enjoying the beautiful landscape and working at his last unfinished investigation on the mechanism of the ear. The day following he died.

There are few more pathetic stories than the life of Riemann, few finer instances of victory gained by inborn genius over a host of adverse circumstances. Few as were the years of work allotted to him, and few as are the printed pages covered by the record of his researches, his name is, and will remain, a household word among mathematicians. Most of his memoirs are masterpieces—full of original methods, profound ideas, and far-reaching imagination. Few sources, we imagine, have been fuller of inspiration for the younger mathematicians of our day than the octavo volume of five hundred pages or so that contains his works; and many an advance in mathematical science will yet be made, with increase of reputation to the maker, by carrying out his suggestions.

The collected works of Riemann were published by H. Weber assisted by R. Dedekind (8vo, Leipzig, 1876). At the end of this volume there is a touching account of his life by the latter, from which the above sketch is almost entirely taken. (G. CH.)

RIENZI, COLA DI (1313–1354). See ROME.

RIESENER, JEAN HENRI (1725–1806), the celebrated cabinet-maker of Louis XVI., was born at Gladbeck near Cologne in 1725. He was employed by Jean François Oeben in the arsenal, and in 1769 married Oeben's widow, by whom he had one son. A number of fine examples of Riesener's cabinets are described in the catalogue of furniture in the South Kensington Museum. He employed tulip, rosewood, holly, maple, laburnum, and purple wood in their construction. Wreaths and bunches of flowers form the centres of his panels; on the sides are diaper patterns in quiet colours. The name of Riesener is stamped sometimes on the panel itself, sometimes on the oak lining of the furniture made by him. The best pieces at the South Kensington Museum are from the collection of Sir Richard Wallace; perhaps the most remarkable is the bureau made for Stanislaus, king of Poland, which is signed by the maker, as is also a similar piece in the Louvre which is accompanied by gilt bronze candle branches by Gouthière. This last work, which bears the date 1769, it is believed that Riesener only finished; and indeed towards the close of his life, after his second marriage (1782) to Marie A. C. Grezel (from whom he was divorced), he ceased to produce anything, and became a collector, buying up his own works. He died January 6, 1806. His son, HENRI FRANÇOIS (1767–1828), was one of the most noted portrait-painters of the first empire. The portrait of M. Ravrio, a worker in bronze (Louvre), is a good example of his talent.

RIESENBERG (Bohemian *Krkonoše*), or Giant Mountains, a lofty and rugged group on the common boundary of Silesia and Bohemia, between the upper courses of the Elbe and the Oder. They form the highest portion of the Sudetic system, which separates south-east Prussia from the Austrian empire, and finds its natural continuation towards the north-west in the Erzgebirge, the Thuringian Forest, and the Harz Mountains. Adjoining the Isergebirge and the Lausitzergebirge on the west, and the Eulengebirge and the Adlergebirge on the east and

south-east, the Riesengebirge proper run south-east and north-west between the sources of the Zacken and the Bober, for a distance of 23 miles, with a breadth of 14 miles. They cover an area of about 425 square miles, three-fourths of which is in Austrian and the remainder in Prussian territory. The boundary line follows the crest of the principal chain or ridge (Riesenkamm), with the highest summits, which stretches along the northern side of the group, with an average height of over 4000 feet. Its principal peaks are the Reifträger (4430 feet), the Hohe Rad (4968 feet), the Great Sturmhaube (4862 feet), the Little Sturmhaube (4646 feet), and, near the east extremity, the Schneekoppe or Riesenkoppe (5266 feet), the loftiest mountain in northern or central Germany. Roughly parallel to this northern ridge, and separated from it by a long narrow valley known as the Siebenbründe, there extends on the south a second and lower chain, of broad massive "saddles," with comparatively few peaks. The chief heights here are the Kesselkoppe (4708 feet), the Krkonose (4849 feet), the Ziegenrücken, and the Brunnenberg (5072 feet). From both ridges spurs of greater or less length are sent off at various angles,—those from the Bohemian ridge being longer, broader, and less abrupt than those from the Riesenkamm. On its northern side this mountain group rises ruggedly and precipitously from the Hirschberg valley; but on its southern side its slope towards Bohemia is very much more gradual. The scenery is in general bold and wild,—the projecting crags and deep rocky gorges and precipices often presenting striking, sometimes even sublime, landscapes. The Bohemian ridge is cleft about the middle by a deep gorge through which pour the headwaters of the river Elbe, which finds its source in the Siebenbründe. The Iser, Bober, Aupa, Zacken, Queiss, and a great number of smaller streams also rise among these mountains or on their skirts; and small lakes and tarns are not unfrequent in the valleys. The Great and Little Schnee gruben,—two deep rocky gorge-like valleys in which snow remains all the year round—lie to the north of the Hohe Rad. Nearly the whole of the Riesenkamm and the western portion of the southern chain are granite; the eastern extremity of the main ridge and several mountains to the south-east are formed of a species of gneiss; and the greater part of the Bohemian chain, especially its summits, consists of mica-slate. Blocks of these minerals lie scattered on the sides and ridges of the mountains and in the beds of the streams; and extensive turf moors occupy many of the mountain slopes and valleys. The lower parts of the Riesengebirge are clad with forests of oak, beech, pine, and fir; above 1600 feet only the last two kinds of trees are found, and beyond about 3950 feet only the dwarf pine (*Pinus Pumilio*). Various alpine plants are found on the Riesengebirge,—some having been artificially introduced on the Schneekoppe. Wheat is grown at an elevation of 1800 feet above the sea-level, and oats as high as 2700 feet. The inhabitants of this mountain region, who are tolerably numerous, especially on the Bohemian side, live for the most part, not in villages, but in scattered huts called "Bauden." They support themselves by the rearing of cattle, tillage, glass-making, and linen-weaving. Mining is carried on only to a small extent for arsenic, although there are traces of former more extensive workings for other metals. Several spots in the Riesengebirge are a good deal frequented as summer resorts; and the Schneekoppe and other summits are annually visited by a considerable number of travellers, who find shelter in the Bauden. The Riesengebirge is the legendary home of Number Nip (Rübezahl), a half-mischievous half-friendly goblin of German folklore; and various localities in the group are more or less directly associated with his name.

RIETI, a city of Italy, in the province of Perugia, 18½ miles south-east of Terni, which is 69 miles by rail from Rome. It occupies a fine position 1396 feet above the sea on the right bank of the Velino (a torrent sub-tributary to the Tiber), which at this point issues from the limestone plateau; the old town occupies the declivity and the new town spreads out on the level. While with its quaint red-roofed houses, its old town walls (restored about 1250), its castle, its cathedral (13th and 15th centuries), its episcopal palace (1283, Andrea Pisano), and its various churches and convents Rieti has no small amount of mediæval picturesqueness, it also displays a good deal of modern activity in wine-growing, cattle-breeding, and sugar-boiling. The fertility of the neighbourhood is celebrated both by Virgil and by Cicero. A Roman bridge over the Velino, Thorwaldsen's monument to Isabella Alfani, and a statue of St Barbara by Berdini, both in the cathedral, and the Palazzo Vincentini by Vignola deserve to be mentioned. The population was 7875 in 1871, and 9618 (with suburbs, 13,679; in the commune, 16,822) in 1881.

According to Terentius Varro (himself perhaps of Reatine birth) and others who have followed him, the people who founded Cures, and afterwards settled on the Palatine at Rome, were natives of the Reatine territory; but this is of somewhat the same questionable character as the other story about the companion of Hercules who was buried at this point near the Via Salaria. About the Via Salaria itself, there is no doubt it led from the sea to Reate and onwards towards Ancona, and was from a very early date the great route for the conveyance of salt to the Sabine country. While hardly mentioned in connexion with the Punic or Civil Wars, Reate is described by Strabo as exhausted by those long contests. Its inhabitants received the Roman franchise at the same time with the rest of the Sabines (290 B.C.), but it appears as a *præfectura* and not as a *municipium* down to the beginning of the empire. It was never made a *colonia*, though veterans of the Prætorian and of the legions Octava and Decima Augusta were settled there by Vespasian, who belonged to a Reatine family and was born in the neighbourhood. For the contests of the Reatines with the people of Interamna see TERNI. About the middle of the 12th century the town was besieged and captured by Roger I. of Sicily. In the struggle between church and empire it always held with the former; and it defied the forces of Frederick II. and Otho IV. Pope Nicholas IV. long resided at Reati, and it was there he crowned Charles II. of Anjou king of the Two Sicilies. In the 14th century Robert, and afterwards Joanna, of Naples managed to keep possession of Reati for many years, but it returned to the States of the Church under Gregory IX. About the year 1500 the liberties of the town, long defended against the encroachments of the popes, were entirely abolished. An earthquake in 1785 was in 1799 followed by the much more disastrous pillage of Reati by the papal troops for a space of fourteen days.

See Aldus Manutius, "Dissert. epistolica de Reati," in *Nov. Thes. Antig. Rom.*, i.; Angelotti, *Descrizione*, 1635; Schenardi, *Antiche lapidi*, 1820; and Michaeli, *Note per la storia di Rieti*, 1868, 1870.

RIETSCHEL, ERNST FRIEDRICH AUGUST (1804–1861), one of the most distinguished of modern German sculptors. Born at Pulsnitz in Saxony in 1804, at an early age he became an art student at Dresden, and subsequently a pupil of Rauch in Berlin. He there gained an art studentship, and studied in Rome in 1827–28. After returning to Saxony he soon brought himself into notice by a colossal statue of Frederick Augustus, king of Saxony, was elected a member of the academy of Dresden, and thenceforth became one of the chief sculptors of his country. In 1832 he was elected to the Dresden professorship of sculpture, and had many foreign orders of merit conferred on him by the Governments of different countries. His death occurred at Dresden in 1861.

Rietschel's style was very varied; he produced works imbued with much religious feeling, and to some extent occupied the same place as a sculptor that Overbeck did in painting. Other important works by Rietschel were purely classical in style. He was specially famed for his portrait figures of eminent men, treated with much idealism and dramatic vigour; among the latter class his chief works were colossal statues of Goethe and Schiller for the town of Weimar, of Weber for Dresden, and of Lessing for Bruns-

wick. He also designed the memorial statue of Luther for Worms, but died before he could carry it out. The principal among Rietschel's religious pieces of sculpture are the well-known Christ-Angel, and a life-sized Pieta, executed for the king of Prussia. He also worked a great deal in rilievo, and produced many graceful pieces, especially a fine series of bas-reliefs representing Night and Morning, Noon and Twilight, designed with much poetical feeling and imagination.

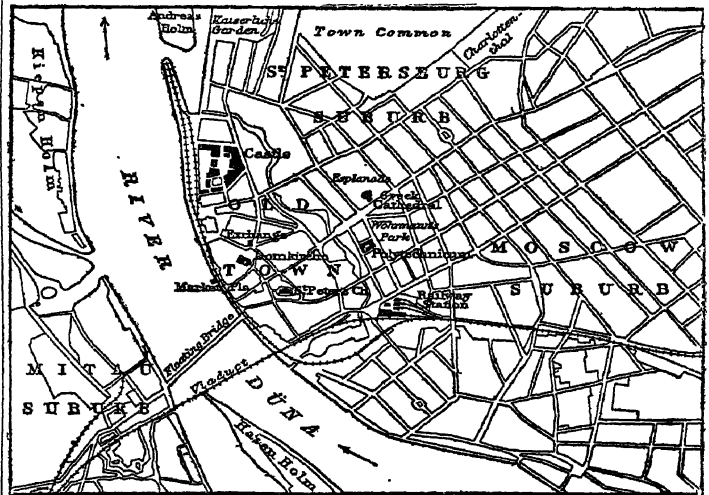

For a good biography of Rietschel and account of his works see Appermann, *Ernst Rietschel*, Leipzig, 1863. (J. H. M.)

RIFLE. See GUNMAKING, vol. xi. p. 281-5.

RIFLEMAN-BIRD, or RIFLE-BIRD, names given by the English in Australia to a very beautiful inhabitant of that country,¹ probably because in coloration it resembled the well-known uniform of the rifle-regiments of the British army, while in its long and projecting hypochondriac plumes and short tail a further likeness might be traced to the hanging pelisse and the jacket formerly worn by the members of those corps. Be that as it may, the cock bird is clothed in velvety-black generally glossed with rich purple, but having each feather of the abdomen broadly tipped with a chevron of green bronze, while the crown of the head is covered with scale-like feathers of glittering green, and on the throat gleams a triangular patch of brilliant bluish emerald, a colour that reappears on the whole upper surface of the middle pair of tail-quills. The hen is greyish-brown above, the crown striated with dull white; the chin, throat, and a streak behind the eye are pale ochreous, and the lower parts deep buff, each feather bearing a black chevron. According to James Wilson (*Ill. Zoology*, pl. xi.), specimens of both sexes were obtained by Sir T. Brisbane at Port Macquarie, whence, in August 1823, they were sent to the Edinburgh Museum, where they arrived the following year; but the species was first described by Swainson in January 1825 (*Zool. Journal*, i. p. 481) as the type of a new genus *Ptiloris*, more properly written *Ptilorrhys*,² and it is generally known in ornithology as *P. paradisea*. It inhabits the northern part of New South Wales and southern part of Queensland as far as Wide Bay, beyond which its place is taken by a kindred species, the *P. victorix* of Gould, which was found by John Macgillivray on the shores and islets of Rockingham Bay. Further to the north, in York Peninsula, occurs what is considered a third species, *P. alberti*, very closely allied to and by some authorities thought to be identical with the *P. magnifica* (Vieillot) of New Guinea—the “Promerops” of many writers. From that country a fifth species, *P. wilsoni*, has also been described by Mr Ogden (*Proc. Acad. Philadelphia*, 1875, p. 451, pl. 25). Little is known of the habits of any of them, but the Rifleman-bird proper is said to get its food by thrusting its somewhat long bill under the loose bark on the boles or boughs of trees, along the latter of which it runs swiftly, or by searching for it on the ground beneath. During the pairing-season the males mount to the higher branches and there display and trim their brilliant plumage in the morning sun, or fly from tree to tree uttering a note which is syllabled “yass” greatly prolonged, but at the same time making, apparently with their wings, an extraordinary noise like that caused by the shaking of a piece of stiff silk stuff. Verreaux informed Mr Elliot that he believed they breed in the holes of trees and lay white eggs; but on that score nothing is really known. The genus *Ptilorrhys*, thought by Gould to be allied to *Climacteris*, has been generally placed near *Epimachus*, which is now considered,

with *Drepanornis* and *Seleucidæ*, to belong to the *Paradisæidæ*, or Birds-of-Paradise, and in his *Monograph* of that Family all the species then known are beautifully figured by Mr Elliot. (A. N.)

RIGA (Esth. *Ria-Lin*), a seaport of Russia, in 56° 57' N. lat. and 24° 6' E. long., 375 miles south-west of St Petersburg, is in population the fifth city of the empire, while in foreign trade it ranks next to St Petersburg and Odessa. It is the seat of the governor-general of the province of Livonia. The Gulf of Riga, 115 miles long and 100 miles in width, with shallow waters of inconsiderable salinity (greatest depth 27 fathoms), freezes to some extent every year. The town is situated at the southern extremity of the gulf, 8 miles above the mouth of the Dūna (Dvina), which brings Riga into water communication with an extensive region, as also with the basins of the Dnieper and Volga. Below the town the Dūna, from 580 to 2300 yards in breadth, divides into several branches, among islands and sand banks, receiving before it enters the sea the Bolderaa river, and expanding towards the east into wider lacustrine basins. At its sea entrance the water

Plan of Riga.

on the bar has an average depth of only 14 feet, and the entrance of the river is protected by the fortress of Dūnamünde, connected by rail with Riga, while another line on the right bank connects the city with the Mūhlgraben village opposite. As the Dūna freezes at Riga for an average of 127 days annually, the port remains closed for navigation from December to March. The roadstead at the mouth of the river, though now protected by a mole, is still too much exposed, so that only such vessels as cannot pass the bar remain there, the others discharging part of their cargo at Bolderaa or Mūhlgraben and then entering the Dūna, which also they leave only partially laden. Improvements designed to obviate these inconveniences are now going on both at the outer harbour and at the new one, the “Zollhafen.”

Riga consists of four parts—the old town and the St Petersburg and the Moscow suburbs standing on the right bank of the Dūna, and the Mitau suburb on the left bank, connected by a floating bridge which is removed in winter, and by a viaduct, 820 feet long, resting on light piers of solid stone, and leaving a passage for ships. The old town still preserves its Hanseatic features—high storehouses, with spacious granaries and cellars, lining the narrow, winding, and busy streets. The only open spaces are the market-place and two other squares, one of which, facing the citadel, is ornamented by a granite column erected in commemoration of the defeat of Napoleon I. The old

¹ Curiously enough its English name seems to be first mentioned in ornithological literature by Frenchmen—Lesson and Garnot—in 1828, who say (*Voy. "Cocquille," Zoologie*, p. 669) that it was applied “pour rappeler que ce fut un soldat de la garnison [of New South Wales] qui le tua le premier,”—which seems to be an insufficient reason, though the statement as to the bird's first murderer may be true.

² Some writers have amended Swainson's faulty name in the form *Ptilornis*, but that is a mistake.

city is so limited that its population increases very slowly. The so-called suburbs on the other hand, with their broad and quiet boulevards on the site of the former fortifications, are steadily growing and undergoing new improvements. The St Petersburg suburb, connected with the city by an avenue of trees, is the seat of the wealthy German aristocracy and merchant community. The rich "polytechnicum" and the new theatre are situated there.

Few antiquities of the mediæval town still remain. The oldest church, the "Domkirche," founded in 1204, was burned in 1547, and the present building dates from the second half of the 16th century. Its organ, with a gas-engine of 4-horse power, and 6826 pipes—dating from 1883—is said to be the largest in the world. St Peter's church, with a beautiful tower 440 feet high, was erected in 1406. The castle, built in 1494–1515 by the master of the Knights of the Sword, Walter von Plettenberg—a spacious building often rebuilt—is now the seat of the governor-general and the Russian authorities. The "House of the Black Heads" (opposite the elegant new town-house), which was the seat of a military corporation founded in 1232, and subsequently became the meeting place of the wealthier youth of the place, has some valuable contents. Of the recent erections, the polytechnic, the exchange, the municipal picture gallery, the monument of Herder, who lived at Riga towards the end of the last century, the gymnasiums of Lomonosoff and Alexander I., and the large bonded warehouse are worthy of notice. The esplanade (where a Greek cathedral now stands), the quiet Wöhrmann's Park, and the well-shaded "Kaiserliche" Park are much visited. The environs of Riga are undergoing constant improvement, and some of them, such as Dubbeln and the sea-bathing resorts of Bildershof and Majorenhof, have numerous visitors in summer.

In 1867 Riga had a population of 102,590 (city, 18,246; St Petersburg suburb, 27,155; Moscow suburb, 41,318; Mitau suburb, 15,871). On December 25, 1881 it had 168,728 inhabitants, the suburbs alone showing an increase of 64,263 (city, 20,091; suburb of St Petersburg, 45,845; of Moscow, 73,705; and of Mitau, 29,587). About one half of the population is German, the remainder being Russian and Lettish in nearly equal proportions, with some 2000 Esthonians and nearly 5000 foreigners. The life of the city has a German character throughout, but the Russians (many of whom were serfs until 1861), and still more the Letts and Esthonians, also display a steadily progressive intellectual life. Both are seeking to counteract the German influence by increasing the number of their educational institutions, the Letts also by the stage and the press. The larger commerce is wholly in German and (to a less extent) English hands. Owing to its communication by water and rail with the forests of White Russia and Volhynia, Riga is a great mart for timber, which in value stands third among the exports. Flax and linseed occupy the first place, Riga being the chief Russian port for the extensive flax-producing region of north-west Russia. Owing to the great railway which crosses the country from Riga to Smolensk, afterwards dividing into two branches, to Orenburg and Tsaritsyn on the lower Volga respectively, Riga is also the great storehouse and place of export for hemp coming by rail from west central Russia, and for corn, Riga merchants sending their buyers as far east as Tamboff. Oats, in particular, are extensively exported to England from the central provinces. Tallow, leather, tobacco, rugs, feathers, and other minor items add considerably to the total value of the exports. The competition of the port of Libau (with exports amounting in 1882 to 31,473,590 roubles) is counterbalanced by the steady development of the Russian railway system, so that the exports of Riga, which in 1851–1860 averaged 17,737,000 roubles, and were 23,964,000 in 1866, amounted in 1882 to 64,159,076 roubles or £6,415,900 (food stuffs, £1,706,300; raw produce, £4,690,170, including timber, £1,295,520; and manufactured wares, £19,436). The imports, consisting chiefly of salt, fish, wine, and cotton, with metals, machinery, coal, oils, fruits, tobacco, and other minor articles, are also rapidly increasing (4,876,000 roubles in 1851–1860, 6,751,000 roubles in 1866, and 34,304,100 roubles in 1882). The food stuffs (salt, fish, tobacco, wine, oils, &c.) reached £514,847; raw produce (chiefly cotton, coal, and metal), £2,043,804; and manufactured wares, £871,132. In 1882 the port was visited by 2347 foreign vessels of 906,200 tons burden; of these 537 (367,110 tons) were from Great Britain;

161 vessels of 89,990 tons, engaged in the coasting trade, also entered the port. Riga is in railway communication with Libau (*via* Mitau), and with St Petersburg (*via* Düna), Warsaw, and central Russia; the traffic is very active,—no less than 11,247,000 cwts. of various wares having been brought to Riga by rail, and 844,000 cwts. shipped on the Düna.

The manufactures of the town and neighbourhood are yearly developing; the chief items are woollen cloth, cottons, machinery, metal wares, cigars, corks, glass, and paper.

The educational institutions include, besides the polytechnic, a Greek seminary, four gymnasiums, some ten private schools for secondary education of boys and girls, and a comparatively large number of primary schools. The municipal library contains very interesting materials relating to the history of the Baltic provinces. The book trade is rapidly extending.

History.—Riga was founded in 1158, as a storehouse at the mouth of the Düna, by a few Bremen merchants. Its name is supposed to be derived from Righ-o, an island formerly separated from the mainland by a branch of the Düna. About 1190 the Augustinian monk Meinhard erected a monastery there, and in 1199–1201 Bishop Albert I. of Livonia obtained from Innocent III. permission for German merchants to land at the new settlement, and chose it for his seat, exercising his power over the neighbouring district in connexion with the Teutonic Knights. As early as the first half of the 13th century the young city obtained the right of electing its own magistracy, and enlarged the walls erected during Albert I.'s time. It joined the Hanseatic League, and from 1253 refused to recognize the rights of the bishop and the knights. Early in the 14th century Riga repelled the attack of the Kuron ruler Lamehinas, and during the next century it had to contend with the knights. In 1420 it fell once more under the rule of the bishop, who maintained his authority until 1566, when it was abolished in consequence of the Reformation. Sigismund III., king of Poland, took Riga in 1547, and in 1558 the Russian commander Prince Serebryanyi reached the town, burned its suburbs and many ships on the Düna, and remained for three days under the walls of the fort. In 1561 Gotthard Kettler publicly abdicated his mastership of the order of Knights of the Sword, and Riga, together with southern Livonia, became a Polish possession; after some unsuccessful attempts to reintroduce Roman Catholicism, Stephen Batory recognized the religious freedom of the Protestant population. Throughout the 17th century Riga—which for nearly three centuries had been a wealthy centre of the commerce of the whole region, and was at this time visited by from three to five hundred ships annually—became a bone of contention between Sweden, Poland, and Russia. In 1621 Gustavus Adolphus took it from Poland, and held it against the Poles and the Russians who besieged it in 1656. During the Northern War it was courageously defended, but after the battle of Poltava it succumbed, and was taken in July 1710 by Sheremetyeff. In 1781 it was made by Russia the capital of the Riga viceroyalty, but fifteen years later, the viceroyalty having been abolished, it was made and still remains the capital of Livonia. In 1812, the approach of the French being apprehended, the suburbs were burnt. Riga still maintains many of its old municipal institutions. The "magistrate" of Riga exercises patrimonial rights over a district comprising several communes around the city. (P. A. K.)

RIGAUD, HYACINTHE (1659–1743), French painter, born at Perpignan 20th July 1659, was the descendant of a line of painters. Having early lost his father, he was sent by his mother to Montpellier, where he studied under Pezet and was helped by Ranc, then to Lyons, and in 1681 to Paris. There, whilst following the regular course of academical instruction, Rigaud produced a great number of portraits so good that Lebrun advised him to give up going to Rome and to devote himself wholly to this class of work. Rigaud, although he had obtained the Great Prize, followed this advice, and for sixty-two years painted at the rate of thirty to forty portraits a year, all carried through with infinite care by his own hand. He had a magnificent emphatic manner appropriate to the rendering of the pompous types of the age, but, although some of his most famous works belong to the class of official portraiture, his talent showed to even greater advantage in the painting of subjects whose life and position admitted of less formal treatment. His portraits of himself, of the sculptor Desjardins (Louvre), of Mignard, and of Lebrun (Louvre) may be cited as triumphs of a still more attractive, if less imposing, character than that displayed in his grand representations of Bossuet (Louvre) and Louis XIV. (Louvre), while his beautiful portraits of his mother, Marie Serre

{Louvre), must for ever remain amongst the masterpieces of French art. Rigaud, although the great successes to which he owed his fame were won without exception in portrait painting, persisted in pressing the Academy to admit him as an historical painter. This delayed his reception, and it was not until January 2, 1700, that he succeeded in obtaining his desire. He presented as his diploma works a St Andrew (Louvre) and the portrait of Desjardins already mentioned, exhibited at the salon of 1704, and filled in turn all the various posts of academical distinction. Having attained a professional position of unsurpassed eminence, Rigaud died at the age of eighty-four on 27th December 1743, having never recovered from the shock of losing his wife in the year previous. He had many pupils, and his numerous works had the good fortune to be reproduced by the greatest of French engravers—Edelinck, Drevet, Wille, Audran, and others.

RIGGING. See SEAMANSHIP.

RIGHT, PETITION OF. See PETITION, vol. xviii. p. 705.

RIGHTS, BILL OF. On the 13th February 1688–89 the Declaration of Right was delivered by the Lords and Commons to the prince and princess of Orange. In October 1689 the rights claimed by the declaration were enacted with some alterations by the Bill of Rights, 1 Will. and M., sess. 2, c. 2, next to Magna Charta the greatest landmark in the constitutional history of England and the nearest approach to the written constitutions of other countries. The Act (the full name of which is “An Act declaring the Rights and Liberties of the Subject, and settling the Succession of the Crown”), after reciting the unconstitutional proceedings of James II., the abdication of that king, the consequent vacancy of the crown, and the summons of the convention parliament, declared, on the part of the Lords and Commons, “for the vindicating and asserting their ancient rights and liberties—

“1. That the pretended power of suspending of laws or the execution of laws by regal authority without consent of parliament is illegal. 2. That the pretended power of dispensing with laws or the execution of laws by regal authority, as it hath been assumed and exercised of late, is illegal. 3. That the commission for erecting the late court of commissioners for ecclesiastical causes, and all other commissions and courts of like nature, are illegal and pernicious. 4. That levying money for or to the use of the crown, by pretence of prerogative, without grant of parliament, for longer time or in other manner than the same is or shall be granted, is illegal. 5. That it is the right of the subjects to petition the king, and all commitments and prosecutions for such petitioning are illegal. 6. That the raising or keeping a standing army within the kingdom in time of peace, unless it be with consent of parliament, is against law. 7. That the subjects which are Protestants may have arms for their defence suitable to their conditions, and as allowed by law. 8. That elections of members of parliament ought to be free. 9. That the freedom of speech, and debates or proceedings in parliament, ought not to be impeached or questioned in any court or place out of parliament. 10. That excessive bail ought not to be required, nor excessive fines imposed, nor cruel and unusual punishments inflicted. 11. That jurors ought to be duly impanelled and returned, and jurors which pass upon men in trials for high treason ought to be freeholders. 12. That all grants and promises of fines and forfeitures of particular persons before conviction are illegal and void. 13. And that for redress of all grievances, and for the amending, strengthening, and preserving of the laws, parliament ought to be held frequently. And they do claim, demand, and insist upon all and singular the premises, as their undoubted rights and liberties.”

The further provisions of the Act were concerned with the settlement of the crown upon the prince and princess of Orange, with the exception of § 12, which negated the right of dispensation by *non obstante* to or of any statute or any part thereof, unless a dispensation be allowed in the statute itself or by bill or bills to be passed during the then session of parliament. An example of an Act giving a dispensing power is 7 & 8 Will. III., c. 37, by which the crown is empowered to grant licences to hold in mortmain *non obstante* the Mortmain Acts.

It is to be noticed that the Declaration of Right and the Bill of Rights introduced no new principle into the English constitution. In the words of Lord Macaulay, “the Declaration of Right, though it made nothing law which had not been law before, contained the germ of every good law which has been passed during more than a century and a half, of every good law which may hereafter in the course of ages be found necessary to promote the public weal, and to satisfy the demands of public opinion” (*History of England*, vol. ii. p. 396). In the United States, the main provisions of the Bill of Rights, so far as they are applicable, have been adopted both in the constitution of the United States and in the State constitutions.

RIMINI. The city of Rimini is bounded on three sides by water. It faces the Adriatic to the north, has the torrent Aprusa, now called Ausa, on the east, and has the river Marecchia, the Arimnum of the ancients and later known as the Ariminum, on the west. It stands in a fertile plain, which on the southern side soon swells into pleasant slopes backed by the jagged peaks of the Umbrian Apennines. The foremost foothill of the range is the steep crag of Mons Titanus crowned by the towers of San Marino. This oldest and smallest of republics commands a prospect of almost unrivalled beauty over hill and plain—to Ravenna on one side, Pesaro on the other, the mountains of Montefeltro, Rimini and its rivers, and across the Adriatic to the Dalmatian coast.

Of the foundation of Rimini nothing certain is known. It was first inhabited by the Umbrians, then by the Etruscans for many centuries. In the 4th century B.C. it was invaded by the Senones, who advanced as far as Sinigaglia. Brennus established himself in Rimini, and marched thence upon Rome, which he destroyed by fire in 390 B.C. After more than a century of dominion the Senones were expelled by the Romans, who founded a military colony in Rimini and made it the seat of the prætor governing the province designated as Ariminum or Gallia Togata. Owing to its position, Rimini rose to increased importance under its new masters. The Romans reopened the mint formerly established by the Gauls, which had issued the “æs grave,” the heaviest Italic coin that has been preserved. Rimini was the starting point of the Flaminian Way leading to Rome, and of the Emilian Way to Piacenza. Later, 134 B.C., the Popilian Way leading as far as Venice was made. In 82 B.C. Rimini was withdrawn from the province of Gaul and included in Italy, of which the frontier was now extended from the Esino to the Rubicon, about ten miles from Rimini near Cesena. This added to the city’s importance. We find continual mention of it in the wars of Marius and Sulla, and by the latter it was afterwards sacked. In 49 B.C. Julius Cæsar crossed the Rubicon with the 13th legion, entered Rimini, and harangued his troops in the great square that still bears his name. A pillar marks the spot on which, according to tradition, he delivered his address.¹ From Rimini, after having assembled the tribunes of the people and summoned the other legions, he went forth on the great expedition that was to lead to the battle of Pharsalia and ultimately to the foundation of the empire.

Rimini was highly favoured under Augustus. That emperor restored the Flaminian Way, and the senate decreed the erection in his honour of the famous arch that is still one of the grandest of ancient monuments. It seems that this arch was originally crowned by a statue of Augustus mounted on a triumphal car (*quadriga*).

¹ A stone originally stood there, mentioned by 15th-century writers as “the big stone (*petrone*), on which he (Cæsar) stood to make his speech.” But this stone, *vetustate collapsum* was replaced in 1555 by the existing column.

But in the Middle Ages this was removed and replaced by the turrets which remain still. Contemporaneously with the arch was built the beautiful bridge over the Marecchia, the only other ancient monument to be found in Rimini, since of the amphitheatre scarcely a stone is left.

During the Middle Ages the history of Rimini has no importance. Alternately captured by Byzantines and Goths, it was rigorously besieged by the latter in 538 A.D. They were, however, compelled to retreat before the reinforcements sent by Belisarius and Narses; thus the Byzantines, after various vicissitudes, became masters of the town, appointed a duke as its governor, and included it in the exarchate of Ravenna. It afterwards fell into the power of the Longobards, and then of the Franks, who yielded it to the pope, for whom it was governed by counts to the end of the 10th century. Soon after this period the imperial power became dominant in Rimini. In 1157 Frederick I. gave it, by imperial patent, the privilege of coining money and the right of self-government; and in the 13th century we find Rimini an independent commune waging war on the neighbouring cities. But throughout these times the main feature of its history is its alternate subjection to pope and emperor. And, weak as the sway of either was, it was strong enough to prevent any genuine local prosperity. During the continued struggle between church and empire, the withdrawal of the one was the signal for the other to advance, and these speedy mutations gave the commune no chance of achieving independence. This state of things went on until the rise of the despots, who, for similar reasons, were powerless to establish themselves on a firm and independent footing. Such indeed was the fate of nearly every city of Romagna excepting Bologna.

In the year 1216 Rimini, being worsted by Cesena, adopted the desperate plan of granting citizenship to two members of the powerful Malatesta tribe, Giovanni and Malatesta, for the sake of their aid and that of their vassals in the defence of the state and the conduct of the war. This family quickly struck root in the town and gave birth to future tyrants; for in 1237 Giovanni was named podestà, and this office was the first step towards the sovereign power afterwards assumed by his descendants. Meanwhile Rimini was torn by the feuds of Guelf and Ghibelline. The latter were the dominant party in the days of Frederick II., although very unpopular on account of the grievous taxes imposed by the empire. Accordingly the majority of the urban nobles joined the Guelfs and were driven into exile. But before long, as the Swabian power declined in Italy, the Guelf party was again predominant.

Then followed a long period of confusion in which, by means of conspiracies and crimes of every kind, the Malatesta succeeded in becoming masters and tyrants of Rimini. And, albeit this string of events is of no historic value, it may serve nevertheless to give an idea of what was occurring throughout Romagna at that time. Giovanni Malatesta had died in 1247 and been succeeded by his son Malatesta, born in 1212, and surnamed Malatesta da Verrucchio. This chieftain, who lived to be a hundred years old, had ample time to mature his ambitious designs, and was the real founder of his house. Seizing the first suitable moment, he placed himself at the head of the exiled Guelfs and restored them to Rimini. Then, as the empire acquired fresh strength in Italy, he quietly bided his time and, on the descent of the Angevins, again assumed the leadership of the Guelfs, who now had the upper hand for a long time. Being repeatedly elected podestà for lengthy terms of office, he at last became the virtual master of Rimini. Nor was he

checked by Rome. Pope Boniface VIII. was fully aware of the rights and traditional pretensions of the Holy See, but preferred to keep on good terms with one who had so largely contributed to the triumph of the Guelfs in Romagna. Accordingly he not only left Malatesta unmolested, but in 1299 conferred on him fresh honours and estates, so that his power went on increasing to the day of his death in 1312.

Four sons had been born to Malatesta—Malatestino, Giovanni the lame, Paolo the Handsome, and Pandolfo; but only the oldest and youngest survived him. Giovanni the lame (*Sciancato*), a man of a daring impetuosity only equalled by his ugliness, had proved so useful a general to Giovanni da Polenta of Ravenna as to win in reward the hand of that potentate's beautiful daughter, known to history as Francesca da Rimini. But her heart had been won by the handsome Paolo, her brother-in-law; and the two lovers, being surprised by Giovanni, were murdered by him on the spot (1285). This episode of the story of the Malatesta has been immortalized in Dante's *Inferno*. Giovanni died in 1304. Thus in 1312 Malatestino became lord of Rimini, and on his decease in 1317 bequeathed the power to his brother Pandolfo. Even in his father's lifetime the new lord had helped to extend the dominions of his house in Pesaro, Fano, Sinigaglia, and Fossombrone. He quickly perceived that, however willing Boniface VIII. might have been to tolerate the increased power of a chief who, like Malatesta da Verrucchio, had rendered such excellent service to the Holy See, it could not be expected that the papacy would really sanction the establishment of a strong and independent state in Romagna. He accordingly turned to the empire, and, siding with Louis the Bavarian, won that monarch's favour for himself and his sons, who in 1342 were appointed imperial vicars.

Pandolfo died in 1326, leaving two heirs, Malatesta and Galeotto. The former was nicknamed Guastafamiglia, because, although at first willing to let his brother share his power, he rid himself by violence and treachery of other kinsmen who claimed their just rights to a portion of the state. His intent was to become sole lord and to aggrandize his tiny principality. But the reigning pope Innocent VI. despatched the terrible Cardinal Albornoz to Romagna and it was speedily reduced by fire and sword. In 1355 the Malatesta shared the fate of the other potentates of the land. Nevertheless it was the cardinal's policy to let existing Governments stand, provided they promised to act in subordination to the papal see. Thus, he granted the Malatesta brothers the investiture of Rimini, Pesaro, Fano, and Fossombrone, and they arranged a division of the state. Guastafamiglia took Pesaro, which was held by his descendants down to the brothers Carlo and Galeazzo. The former of these, who died in 1439, was father to the Parisina beheaded in Ferrara, whose tragic love story has been sung by Byron. The latter won the title of "l'Inetto" (the Incapable) by the foolish sale of his rights over Pesaro to the Sforza in 1447.

Galeotto, on the other hand, retained the lordship of Rimini, ruling tranquilly and on good terms with the popes, who allowed him to add Cervia, Cesena, and Bertinoro to his states. Dying in 1385 at the age of eighty, he left two sons—Carlo, who became lord of Rimini, and Pandolfo, who had Fano for his share. Carlo (1364–1429) was energetic, valiant, and a friend of the popes, who named him vicar of the church in Romagna. He was a patron of letters and the arts, and during his reign his court began to be renowned for its splendour. As he left no issue, his inheritance was added to that of his brother Pandolfo, and Fano was once more united to Rimini. Pandolfo (1370–1427) had led the life of a

condottiere, taking a prominent part in the Lombard wars following on the death of Galeazzo Maria Visconti, and held rule for some time in Brescia and Bergamo. He left three natural sons, who were declared legitimate by Pope Martin V. The eldest, Galeotto (1411-32), was an ascetic, gave little or no attention to public business, and, dying early, bequeathed the state to his brother Sigismondo Pandolfo. The third son, Novello Malatesta (1418-65), ruled over Cesena.

Sigismondo (1417-68) is the personage to whom Rimini owes its renown during the Renaissance, of which indeed he was one of the strangest and most original representatives. He was born in Brescia, and when called to the succession, at the age of fifteen, had already given proofs of valour in the field. Of a robust and handsome person, he was a daring soldier and an astute politician. His knowledge of antiquity was so profound as to excite the admiration of all the learned men with whom he discoursed, even when, as in the case of Pius II., they chanced to be his personal enemies. A captain of renown and a skilful military engineer, he was also a generous patron of the fine arts and of letters. To him is due the erection of the church of St Francis, or temple of the Malatesta, one of the rarest gems of the Renaissance and the greatest of Rimini's treasures. Sigismondo devoted enormous sums of money and much time and care to this building, giving it so original a stamp and one so thoroughly expressive of his own mind and character that, to a great extent, it may be considered his work. But he too was a man devoid of all faith and conscience, of all respect human or divine. Of so dissolute a life that, although married, he had children by several mistresses at the same time, he gave vent to all his passions with a ferocity that was bestial rather than human. And—as the crowning contradiction of his strange nature—from his youth to the day of his death he remained the devoted lover of the woman for whose sake he became a poet, whom he finally made his wife, and whom he exalted in every way, even to the point of rendering her almost divine honours. Yet this love never availed to check his excesses. The blood in his veins resembled that of the Borgia; and of him, as of that iniquitous race, tradition has added much to the evil recorded by history, and truth and falsehood have been so subtly mingled that it is often difficult, sometimes impossible, to distinguish the one from the other.

On assuming power in 1432 Sigismondo was already affianced to the daughter of Count Carmagnola, but when that famous leader was arraigned as a traitor by the Venetians, and ignominiously put to death, he promptly withdrew from his engagement, under the pretext that it was impossible to marry the child of a criminal. In fact he aimed at a higher alliance, for he espoused Ginevra d'Este, daughter of the duke of Ferrara, and his entry into Rimini with his bride in 1434 was celebrated by splendid festivities. In 1437 a son was born to him, but died within the year, and in 1440 the young mother followed it to the grave. Every one declared that she died by poison administered by her husband. This, however, was never proved. The duke of Ferrara remained his friend, nor is it known what motive Sigismondo could have for wishing to get rid of his wife. Two years afterwards he married Polissena, daughter of the famous condottiere Francesco Sforza, who in 1443 bore him a son named Galeotto Roberto. But by this time he was already madly in love with Isotta degli Atti, and this was the passion that endured to his death. The lady succeeded in gaining an absolute ascendancy over him, which increased with time. She bore him several children, but this did not prevent his having others by different concubines. Nor

was this the sum of his excesses. He presently conceived a frantic passion for a German lady, the wife of a certain Borbona, who repulsed his advances. Thereupon he planned an ambushade on the road to Fano in order to seize her by force. The lady arrived escorted by armed men, but Sigismondo attacked her so furiously that she was killed in the struggle, and it is said that he then wreaked his lust on her corpse (19th December 1448). Such being the nature of the man, it is not astonishing that, as his ardour for Isotta increased, he should have little scruple in ridding himself of his second wife. On the 1st June 1450 Polissena died by strangling, and on the 30th of the same month Isotta's offspring were legitimated by Nicholas V.

It is only just to record that, although Malatesta's intrigue with Isotta had long been notorious to all, and he had never sought to conceal it, no one ever accused her of either direct or indirect complicity in her lover's crimes. Isotta's history, however, is a strange one, and opens up many curious questions. She was of noble birth and seems to have attracted Sigismondo's notice as early as 1438, for at the age of twenty he produced verses of some merit in praise of her charms. She was indeed widely celebrated for her beauty and intellect, culture, firmness, and prudence; and even Pope Pius II. proclaimed her worthy to be greatly loved. When Sigismondo was absent she governed Rimini wisely and well, and proved herself a match for the statesmen with whom she had to deal. The leading poets of the court dedicated to her a collection of verses entitled *Isottæi*, styled her their mistress and the chosen of Apollo. Artists of renown perpetuated her features on canvas, on marble, and on many exquisite medals, one of which has a closed book graven on the reverse, with the inscription "*Elegiæ*" in allusion to poems she was said to have written. Nevertheless M. Yriarte, in his well-known book on the Malatesta and Rimini, asserts that there is documentary evidence to prove that Isotta was unable to sign her own name. He has arrived at this conclusion on the strength of certain documents found in the archives of Siena. These consist mainly of two letters addressed to Malatesta in 1454, when he was encamped near Siena, and both written and signed by the same hand. The first, signed Isotta, gives him news of his children, affectionately reproaches him with having betrayed her for the daughter of one Messer Galeazzo, and winds up by saying that she cannot be happy until he fulfils his often renewed promise, *i.e.*, to make her his wife. The second, bearing the same date, is signed with the initials of another woman: "*De la V. S. serva*" (Your Highness's servant) "*S. de M.*"—probably one of the Malatesta. This correspondent says that she had already written to him that day, by command of Isotta, who had gone with her to see Messer Galeazzo's daughter, and freely vented her just indignation. Therefore M. Yriarte maintains that, had Isotta been able to write herself, she would not have employed another to speak of her love and jealousy and of the desired marriage. He feels assured that Isotta must have been altogether illiterate, since even the signature was written by another.¹ But, as the second letter proves that Isotta went with her confidant to vent her rage on her rival, it is plain that she had no secrets from that friend. It is also possible that S. de M. (particularly if a Malatesta) had

¹ The two letters are dated respectively 20th and 21st December; but this must be an error, inasmuch as the second begins thus—"To-day Madonna Isotta made me write to you." The year is not given, but it must have been 1454, since it was then, as we shall presently see, that the Sienese seized the papers of their general Malatesta, who, after betraying them, had hastily fled from the camp. Thus these letters, and other Malatestian documents, came to be preserved among the archives of Siena where they are still to be seen.

been charged by Sigismondo to watch over Isotta, and therefore not only acted as her amanuensis, but also wrote privately to explain or confirm that which she had already written to him by Isotta's wish. For the tyrant of Rimini was of a brutally jealous nature. At any rate the second letter solves the doubts suggested by the first. Nor is it at all surprising that Isotta should have her letters written and signed by another hand, when such was by no means an uncommon practice among the princes and nobilities of her day. Lucrezia Borgia, for instance, frequently did the same. It is besides simply incredible that a woman of the Italian Renaissance, of Isotta's birth, standing, and reputation, should have been unable to write.

Her marriage with Malatesta did not take place until 1456; but of the ardent affection that had long bound them together there are stronger proofs than the lover's juvenile verses, or than even the children Isotta had borne to him. For, more than all else, the temple of St Francis has served to transmit to posterity the history of their loves. Malatesta decided on building this remarkable church as a thankoffering for his safety during a dangerous campaign undertaken for Pope Eugenius IV. about the year 1445.

The first stone was laid in 1446, and the work was carried on with so much alacrity that mass was performed in it by the close of 1450. Sigismondo entrusted the execution of his plans to L. B. Alberti, who had to encase in a shell of classic architecture a 13th-century Franciscan church. The original edifice being left intact, it was a difficult question how to deal with the windows and the Gothic arches of the interior. Alberti solved the problem with marvellous skill, blending the old architecture with the new style of the Renaissance, and giving it variety without destroying its unity of effect.

Being eager to adorn his temple with the most precious marbles, Sigismondo's veneration for antiquity did not prevent him from pillaging many valuable classical remains in Rimini, Ravenna, and even in Greece. Such was the zeal with which Alberti pursued his task that the exterior of the little Rimini church is one of the finest and purest achievements of the Renaissance, and surpasses in beauty and elegance all the rest of his works. But it is much to be deplored that he should have left the upper part of the façade unfinished. Alberti came to Rimini, made his design, saw the work begun, and then left it to be carried out by very skilful artists, on whom he impressed the necessity of faithfully preserving its general character so as "not to spoil that music."

The internal decorations, especially the enormous quantity of wall ornaments, consisting chiefly of scrolls and bas-reliefs, were executed by different sculptors under the personal direction of Malatesta, who, even when engaged in war, sent continual instructions about their work. It is difficult to give an exact idea of this extraordinary church to those who have no personal acquaintance with it. The vault was never finished, and still shows its rough beams and rafters. The eight side chapels alone are complete, and their pointed arches spring from Renaissance pilasters planted on black marble elephants, the Malatesta emblems, or on baskets of fruit held by children. The surface of the pilasters is divided into compartments encrusted with bas-reliefs of various subjects and styles. Everywhere—on the balustrades closing the chapels, round the base of the pilasters, along the walls, beneath the cornice of both the exterior and the interior of the church—there is one ornament that is perpetually repeated, the interwoven initials of Sigismondo and Isotta. This monogram is alternated with the portrait and arms of Malatesta; and these designs are enwreathed by festoons linked together by the tyrant's second emblem, the rose. The most singular and characteristic feature of this edifice is the almost total absence of every sacred emblem. Rather than to St Francis and the God of the Christians it was dedicated—and that while Sigismondo's second wife still lived—to the glorification of an unhallowed attachment. Nature, science, and antiquity were summoned to celebrate the tyrant's love for Isotta. The bas-reliefs of one of the chapels represent Jupiter, Venus, Saturn, Mars, and Diana, together with the signs of the zodiac. And these subjects are derived, it appears, from a poem in which Sigismondo had invoked the gods and the signs of the zodiac to soften Isotta's heart and win her to his arms. The pageants of Mars and Diana seem to have been suggested by the *Trionfi* of Petrarch. Elsewhere we see prophets and sibyls, personifications of the theological virtues and of the sciences. The delicate bas-reliefs of botany and medicine, history and astronomy, have been judged by some writers to be Grecian, on account of the

ancient appearance of their marble, their inscriptions in Greek and Latin, and others that have never been deciphered. But a moment's examination of the sculptures is enough to destroy this hypothesis. Besides, some of the inscriptions are very easily read and record "Apollo Ariminæus" and "Jupiter Ariminæus."

In the first chapel on the left is the family tomb of the Malatesta, with sculptured records of their triumphs and of their alleged descent from Scipio Africanus. Better worthy of notice is the third chapel to the right, known as that of the Angels, on account of the angels and children carved on its pillars. It is nominally dedicated to the archangel Michael, whose statue is enshrined in it; but the figure has the face of Isotta, the ruling deity of this portion of the church. For here is the splendid and fantastic tomb erected to this lady, during her life and previous to the death of Sigismondo's second wife. No monument, be it remarked, is raised over the burial-place of Ginevra and Polissena. The urn of Isotta's sarcophagus is supported by two elephants, and bears the inscription, "D. Isottæ Ariminensi B. M. Sacrum, MCCCCL." The "D." has been generally interpreted as "Divæ" and the "B. M." as "Beatæ Memoræ." But some, unwilling to credit such profanity, allege that the letters stand for "Bonæ Memoræ." Nevertheless all who have seen the church must admit the improbability of similar scruples.

The numerous artists employed on the interior of the church were under the direction of the *proto-maestro* Matteo de Pasti, the celebrated medallist. And indeed the peculiar and fantastic character of the sculptures in this chapel frequently recalls the designs of his famous works. All this decoration is in strange contrast with the grandly austere simplicity of the façade and outer walls of the church. There no ornament disturbs the harmony of the lines. The frieze beneath the cornice, reproducing the lovers' initials and the Malatestian ensigns, is in such very low relief that it only enhances the perfection of "that music" produced by the marvellous skill of Leo Battista Alberti. Also the colour of the stone, a soft creamy white, adds to the general beauty of effect. And everything both within and without contributes to the profane and pagan character which it was Sigismondo's purpose to impress on the Christian church. On each of its outer walls are seven arched recesses, intended to contain the ashes of the first literati and scientists of his court. In the first, to the right, is the urn of the poet Basinio, one of his pensioners, in the second that of Giusto de' Conti, author of some rhymes on the *Bella Mano*, while the third bore the more famous name of Gemisthus Pletho. This well-known Byzantine philosopher was the diffuser of Platonism in Florence during the time of Cosimo de' Medici, and had faith in the revival of paganism. Returning to his own people, he had died in the Morea. Sigismondo, having gone there in command of the Venetian expedition against the Turks, exhumed the philosopher's bones as holy relics, and brought them to Rimini for worthy sepulture in his Christian pantheon. All this is solemnly recorded in the inscription, which is dated 1465. The fourth sarcophagus was that of Roberto Valturio, the engineer, author of *De Re Militari*, who had been Sigismondo's minister and had aided him in the construction of the castle of Rimini. The other urns on this side were placed by Malatesta's successors, and the arches on the left wall remained untenanted.

Sigismondo understood the science of fortification. He was also the first to discard the use of wooden bomb shells, and substitute others cast in bronze. As a soldier his numerous campaigns had shown him to be possessed of all the best qualities and worst defects of the free captains of his time. He began his military career in 1432 in the service of Eugenius IV.; but, when this pope doubted his good faith and transferred the command to another, he sided with the Venetians against him, though at a later date he again served under him. On the decease of Filippo Maria Visconti in 1447, he joined the Aragonese against Venice and Florence, but, presently changing his flag, fought valiantly against Alphonso of Aragon and forced him to raise the siege of Piombino. In 1454 he accepted a command from the Sienese, but suddenly, after his usual fashion, he made peace with the enemies of the republic, and had to save himself by flight from arrest for his perfidy. It was then that the letters from Isotta were confiscated. After this he began scheming to hasten the coming of the Angevins, and took part in new and more hazardous campaigns against adversaries such as the duke of Urbino, Sforza of Milan, Piccinino, and, worst of all, the Sienese pope, Pius II., his declared and mortal foe. This time Sigismondo had blundered; for the cause of Anjou was hopelessly ruined in Italy. He

was therefore driven to make his submission to the pope but, again rebelling, was summoned to trial in Rome (1460) before a tribunal of hostile cardinals. All the old charges against him were now revived and eagerly confirmed. He was pronounced guilty of rapine, incendiarism, incest, assassination, and heresy. The murder and violation of Borbona's wife was brought up; he was accused of having tortured his former preceptor, in revenge for punishments received in his youth, and of having killed three wives—although it seems that he had only two besides his ever-beloved Isotta, who survived him. He was also severely blamed for the erection of a temple which, as the pope justly remarked, was better adapted for the worship of pagan demons than of the Christian God. Nor was it forgotten how, when Pius II. had proclaimed a crusade against the infidels at the assembly at Mantua, Sigismondo had secretly invited the Grand Turk to make a descent upon Italy. Consequently he was sentenced to the deprivation of his state (which was probably the main object of the trial), and to be burnt alive as a heretic.

This sentence, however, could not easily be executed, and Sigismondo was only burnt in effigy. But the pope marked the intensity of his hatred by causing the dummy to be carved and dressed with such life-like resemblance that he was almost able to persuade himself that his hated enemy was really consumed in the flames. Malatesta could afford to laugh at this farce, but he nevertheless prepared in haste for a desperate defence (1462). He knew that the bishop Vitelleschi, together with the duke of Urbino and his own brother Novello Malatesta, lord of Cesena, were advancing against him in force; and, being defeated by them at Pian di Marotta, he was driven to Rome in 1463 to again make submission to the pope. This time he was stripped of all his possessions excepting the city of Rimini and a neighbouring castle, but the sentence of excommunication was withdrawn. For, now that Malatesta's power was crushed, the object of the war was attained. Its continuance would have been inexpedient, and might have too suddenly roused the fears of the other potentates of Romagna, who were all destined, sooner or later, to share the same fate. The once mighty tyrant of Rimini found himself reduced to penury with a state chiefly composed of a single town. He therefore took service with the Venetians, and in 1464 had the command of an expedition to the Morea. Here his movements were so hampered by the interference of the commissioners of the republic that, with all his valour, he could achieve no decisive success. In 1466 he was able to return to Rimini, for Pius II. was dead, and the new pope, Paul II., was less hostile to him. Indeed the latter offered to give him Spoleto and Foligno, taking Rimini in exchange; but Malatesta was so enraged by the proposal that he went to Rome with a dagger concealed on his person, on purpose to kill the pope. But, being forewarned, Paul received him with great ceremony, and surrounded by cardinals prepared for defence; whereupon Sigismondo changed his mind, fell on his knees and implored forgiveness. His star had now set for ever. For sheer subsistence he had to hire his sword to the pope and quell petty rebellions with a handful of men. At last, his health failing, he returned to his family, and died in Rimini on the 7th October 1468, aged fifty-one years.

He was succeeded, according to his desire, by Isotta and his son Sallustio. But there was an illegitimate elder son by another mother, named Roberto Malatesta, a valiant and unscrupulous soldier. Befriended by the pope, this man undertook to conquer Rimini for the Holy See, but came there to further his own ends instead (20th October 1469), and, while feigning a desire to share the government with Isotta and her son, resolved, sooner

or later, to seize it for himself. This aroused the pope's wrath, and Roberto instantly prepared for defence. Finding an ally in the duke of Urbino, whose eyes were now opened to the aggressive policy of the church, he was able to repulse its forces. Paul II. died soon after, and was succeeded by Sixtus IV. Roberto's position was now more secure, and in order to strengthen his recent alliance he betrothed himself to the daughter of the duke of Urbino. The next step was to dispose of his rival kindred. On the 8th August 1470 Isotta's son was found murdered in a well belonging to the Marcheselli family; and a blood-stained sword, placed in their courtyard by Roberto, made it appear as though they had been guilty of the crime. Towards the end of the same year Isotta died also, apparently of a slow fever, but really, it was believed, by poison. Another of her sons, Valerio, born in 1453, still lived, but he was openly put to death by Roberto on a trumped-up charge of treason. In 1475 the new tyrant celebrated his nuptials with the duke of Urbino's daughter, and, being again taken into favour by the pope, valiantly defended him in Rome against the attacks of the duke of Calabria, and died there in 1482 of the hardships endured in the war. His widow was left regent during the minority of his son Pandolfo, who was nicknamed Pandolfaccio on account of his evil nature. Directly he was of age, he seized the reins of government by killing some relations who had plotted against him, and crushed another conspiracy in the same way. A daring soldier, he distinguished himself at the battle of the Taro against the French; but his tyranny made him hated by his subjects. In 1500, when Cesare Borgia fell on Romagna with violence and fraud, this Malatesta shared the fate of other petty tyrants and had to fly for his life. After the fall of the Borgia he returned, but, being bitterly detested by his people, decided to sell his rights to the Venetians, who had long desired to possess Rimini, and who gave him in exchange the town of Cittadella, some ready money, and a pension for life.

This arrangement was naturally disapproved by Rome, and especially by Julius II., who had already repeatedly vowed that, unless Venice restored the cities she had so unjustly seized—Cervia, Ravenna, and Rimini—he would turn the world upside down to regain them. And he kept his word. For he contrived the league of Cambray on purpose to ruin the Venetians, who were crushingly defeated in 1509. Thereupon the pope, having accomplished his own ends, made alliance with the Venetians, who were now prostrate at his feet, and, with them, the Spaniards, and the Swiss, fought against the French at Ravenna in 1512. Here the French were victors, but owing to their heavy losses and the death of their renowned leader, Gaston de Foix, were compelled to retreat. Thus Julius became master of Rimini and the other coveted lands. Malatesta made more than one attempt to win back his city, but always in vain, for his subjects preferred the papal rule. He returned there for the last time while Marshal Bourbon was laying siege to Rome; but in 1528 Pope Clement VII. became definitive master of the town. Thus, after two hundred and fifty years, the sway of the Malatesta came to an end, and Pandolfo was reduced to beggary. In fact, we find him petitioning the duke of Ferrara for the gift of a couple of crowns and promising to ask for no more. He died in 1534, leaving a daughter and two sons in great poverty. The elder, Sigismondo, after various military adventures, died at Reggio d'Emilia in 1543; and Malatesta, the younger, went to fight in the Scotch and English wars, and was never heard of again. Sigismondo had left male heirs who made another attempt to regain Rimini in 1555, but Pope Paul IV. declared them deposed in perpetuity in punishment of Pandolfaccio's misdeeds.

From that time the Malatesta became citizens of Venice; their names were inscribed in the Golden Book, and they were admitted to the grand council. With the death, in 1716, of Christina Malatesta, the wife of Niccolò Boldu, the Rimini branch of the family became extinct. The descendants of Giovanni, brother of Malatesta da Verrucchio, who married one of the Sogliano, were known as the Sogliano-Malatesta. The representatives of this branch settled in Rome.

The history of Rimini practically ends with its independence. It fell into obscurity under the rule of the popes, and was not again mentioned in history until, in 1831 and 1845, it took a prominent part in the revolutionary movements against papal despotism and in favour of Italian independence. Although Rimini, like many other cities of Romagna, is now harassed by republican and socialistic sects, it is a thriving town and enjoys increasing prosperity. It had in 1881 a population of 37,248 souls, being the centre of a district containing 88,110 inhabitants, and is part of the province of Forlì, which, divided into the three districts of Cesena, Forlì, and Rimini, has a total population of 252,883 souls. Many small manufactures are carried on at Rimini, but agriculture is its principal resource, and its produce in corn and wine is considerably in excess of the local consumption. Its sea-bathing establishment attracts many visitors during the summer months, and conduces to the prosperity of the town. Rimini also boasts a good public library of 28,000 volumes, inclusive of 850 MSS.; and it has a record office containing several thousand ancient MSS.

RINDERPEST. See MURRAIN, vol. xvii. p. 59.

RING (Gr. *δακτύλιος*, Lat. *annulus*).¹ At an early period, when the art of writing was known to but very few, it was commonly the custom for men to wear rings on which some distinguishing sign or badge was engraved (*ἐπίσημον*), so that by using it as a seal the owner could give a proof of authenticity to letters or other documents. Thus, when some royal personage wished to delegate his power to one of his officials, it was not unusual for him to hand over his signet ring, by means of which the full royal authority could be given to the written commands of the subordinate. The enlarged part of a ring on which the device is engraved is called the "bezel," the rest of it being the "hoop."

Egyptian rings. The earliest existing rings are naturally those found in the tombs of ancient Egypt. The finest examples date from about the 18th to the 20th dynasty; they are of pure gold, simple in design, very heavy and massive, and have usually the name and titles of the owner deeply sunk in hieroglyphic characters on an oblong gold bezel. Rings worn in Egypt by the poorer classes were made of less costly materials, such as silver, bronze, glass, or pottery covered with a siliceous glaze and coloured brilliant blue or green with various copper oxides. Some of these had hieroglyphic inscriptions impressed while the clay was moist. Other examples have been found made of ivory, amber, and hard stones, such as carnelian. Another form of ring used under the later dynasties of Egypt had a scarab in place of the bezel, and was mounted on a gold hoop which passed through the hole in the scarab and allowed it to revolve.

Cylinder. In ancient Babylonia and Assyria finger rings do not appear to have been used. In those countries the signet took a different form, namely, that of a cylinder cut in

crystal or other hard stone, and perforated from end to end. A cord was passed through it, and it was worn on the wrist like a bracelet. This way of wearing the signet is more than once alluded to in the Old Testament (Gen. xxxviii. 18, Revised Version, and Cant. viii. 6).

The Etruscans used very largely the gold swivel ring mounted with a scarab, a form of signet probably introduced from Egypt. Some found in Etruscan tombs have real Egyptian scarabs with legible hieroglyphs; others, probably the work of Phœnician or native engravers, have rude copies of hieroglyphs, either quite or partially illegible. A third and more numerous class of Etruscan signet rings have scarabs, cut usually in sard or carnelian, which are a link between the art of Egypt and that of Greece, the design cut on the flat side being Hellenic in style, while the back is shaped like the ordinary Egyptian scarabæus beetle.

Among the Greeks signet rings were very largely worn, and were usually set with engraved gems. In Sparta a sumptuary law was passed at an early time to forbid any substance more valuable than iron to be used for signet rings; but in other parts of the Hellenic world there appears to have been no restriction of this sort. In some of the numerous tombs of Etruria and Kertch (Panticapæum) in the Cimmerian Bosphorus gold rings of great magnificence have been discovered, apparently of the finest Greek workmanship. One from Etruria, now in the British Museum, is formed by two minutely modelled lions whose bodies form the hoop, while their paws hold the bezel, a scarab engraved with a lion of heraldic character. Many other examples of this design have been found, some of which are among the finest existing specimens of Hellenic or Græco-Etruscan jewellery. Another remarkable specimen from an Etruscan tomb is of Etrusco-Latin work. The hoop of the ring is formed by two minute gold figures of Hercules and Juno Sospita, the stone being set between their heads. Many of the Greek rings are of thin repoussé gold, so as to make the most show for the least cost; one fine example, early in date, has its hoop formed of two dolphins, holding a plain white stone.

The Romans appear to have imitated the simplicity of Roman Lacedæmonia. Throughout the republic none but iron rings were worn by the bulk of the citizens. Ambassadors were the first who were privileged to wear gold rings, and then only while performing some public duty. Next senators, consuls, equites, and all the chief officers of state received the *jus annuli aurei*. One early Roman ring of the highest historical interest still exists; it belonged to Cornelius Scipio Barbatus, consul in 298 B.C., in whose sarcophagus, now in the Vatican, it was found in 1780.² It is of plain rudely hammered gold, and is set with an intaglio on sard of a figure of Victory, purely Roman in style, dating before 300 B.C. In the Augustan age many valuable collections of antique rings were made, and were frequently offered as gifts in the temples of Rome. One of the largest and most valuable of the *dactylhothecæ* was dedicated in the temple of Apollo Palatinus by Augustus's nephew Marcellus, who had formed the collection (Pliny, *H. N.*, xxxvii. 5). The temple of Concord in the Forum contained another; among this latter collection was the celebrated ring of Polycrates, king of Samos, the story of which is told by Herodotus (see vol. xix. p. 417); Pliny, however, doubts the authenticity of this relic (*H. N.*, xxxvii. 2).

Different laws as to the wearing of rings existed during the empire: Tiberius made a large property qualification necessary for the wearing of gold rings; Severus conceded the right to all Roman soldiers; and later still all free citizens possessed the *jus annuli aurei*, silver rings being

¹ Compare GEMS, vol. x. p. 136.

² This ring afterwards passed into the Beverley collection.

worn by freedmen and iron by slaves. Under Justinian even these restrictions passed away.

In the 3d and 4th centuries Roman rings were made engraved with Christian symbols. Fig. 1 shows two silver rings of the latter part of the 4th century, which were found in 1881 concealed in a hole in the pavement of a Roman villa at Fifehead Neville, Dorset, together with some coins of the same period. Both have the monogram of Christ, and one has a dove within an olive wreath rudely cut on the silver bezel. These rings are of special interest, as Roman objects with any Christian device have very rarely been found in Britain.

FIG. 1.—Roman silver rings.

Celtic rings.

Large numbers of gold rings have been found in many parts of Europe in the tombs of early Celtic races. They are usually of very pure gold, often penannular in form—with a slight break, that is, in the hoop so as to form a spring. They are often of gold wire formed into a sort of rope, or else a simple bar twisted in an ornamental way. Some of the quite plain penannular rings were used in the place of coined money.

Throughout the Middle Ages the signet ring was a thing of great importance in religious, legal, commercial, and private matters.

Episcopal rings.

The episcopal ring¹ was solemnly conferred upon the newly made bishop together with his crozier, a special formula for this being inserted in the Pontifical. In the time of Innocent III. (1194) this was ordered to be of pure gold mounted with a stone that was not engraved; but this rule appears not to have been strictly kept. Owing to the custom of burying the episcopal ring in its owner's coffin a great many fine examples still exist. Among the splendid collection of rings formed by the distinguished naturalist Edmund Waterton, and now in the South Kensington Museum, is a fine gold episcopal ring decorated with niello, and inscribed with the name of Alhstan, bishop of Sherborne from 824 to 867 (see fig. 2).² In many cases

FIG. 2.—Ring of Bishop Alhstan.

an antique gem was mounted in the bishop's ring, and often an inscription was added in the gold setting of the gem to give a Christian name to the pagan figure. The monks of Durham, for example, made an intaglio of Jupiter Serapis into a portrait of St Oswald by adding the legend CAPVT S. OSWALDI. In other cases the engraved gem appears to have been merely regarded as an ornament without meaning, as, for example, a magnificent gold ring found in the coffin of Seffrid, bishop of Chichester (1125–1151), in which is mounted a Gnostic intaglio. Another in the Waterton collection bears a Roman cameo in plasma of a female head in high relief; the gold ring itself is of the 12th century. More commonly the episcopal ring was set with a large sapphire, ruby, or other stone cut *en cabochon*, that is, without facets, and very magnificent in effect (see fig. 3). It was worn over the bishop's gloves, usually on the fore-finger of the right hand; and this accounts for the large size of the hoop of these rings. In the 15th and 16th centuries bishops often wore three or four rings on the right hand

FIG. 3.—15th-century episcopal ring of Italian workmanship, of gold, set with a sapphire *en cabochon*.

in addition to a large jewel which was fixed to the back of each glove.

Cramp rings were much worn during the Middle Ages Cramp as a preservative against cramp. They derived their rings. virtue from being blessed by the king; a special form of service was used for this, and a large number of rings were consecrated at one time, usually when the sovereign touched patients for the king's evil.

Decade rings were not uncommon, especially in the 15th Decade century; these were so called from their having ten rings knobs along the hoop of the ring, and were used, after the manner of rosaries, to say nine aves and a paternoster. In some cases there are only nine knobs, the bezel of the ring being counted in, and taking the place of the *gaude* in a rosary. The bezel of these rings is usually engraved with a sacred monogram or word.

Gemel or gimmel rings, from the Latin *gemellus*, a twin, Gemel were made with two hoops fitted together, and could be rings. worn either together or singly; they were common in the 16th and 17th centuries, and were much used as betrothal rings.

Posy rings,³ so called from the "posy" or rhyme en-Posy graved on them, were specially common in the same cen-rings. turies. The name posy ring does not occur earlier than the 16th century. A posy ring inscribed with "love me and leave me not" is mentioned by Shakespeare (*Mer. of Ven.*, act v. sc. 1). The custom of inscribing rings with mottoes or words of good omen dates from a very early time. Greek and Roman rings exist with words such as ΖΗΤΑΙΟ, ΧΑΙΡΕ, ΚΑΛΗ, or *votis meis Claudia vivas*. In the Middle Ages many rings were inscribed with words of cabalistic power, such as *anam zapta*, or Caspar, Melchior, and Balthasar, the supposed names of the Magi. In the 17th century they were largely used as wedding rings, with such phrases as "love and obaye," "fear God and love me," or "mulier viro subjecta esto."

In the same century memorial rings with a name and Memorial date of death were frequently made of very elaborate rings. form, enamelled in black and white; a not unusual design was two skeletons bent along the hoop, and holding a coffin which formed the bezel.

In the 15th and 16th centuries signet rings engraved Mer- with a badge or trademark were much used by merchants chaunts' and others; these were not only used to form seals, but rings. the ring itself was often sent by a trusty bearer as the proof of the genuineness of a bill of demand.⁴ At the same time private gentlemen used massive rings wholly of gold with their initials cut on the bezel, and a graceful knot of flowers twining round the letters. Of this kind is Shakespeare's ring, now in the British Museum, which was found near the church of Stratford; on it is cut a cord arranged in loops between the letters W and S. Other fine gold rings of this period have coats of arms or crests with graceful lambrequins.

Poison rings with a hollow bezel were used in classical Poison times; as, for example, that by which Hannibal killed rings. himself, and the poison ring of Demosthenes. Pliny records that, after Crassus had stolen the gold treasure from under the throne of Capitoline Jupiter, the guardian of the shrine, to escape torture, "broke the gem of his ring in his mouth and died immediately." The mediæval *anello della morte*, supposed to be a Venetian invention, was actually used as an easy method of murder. Among the elaborate ornaments of the bezel a hollow point made to work with a spring was concealed; it communicated with a receptacle for poison in a cavity behind, in such a

¹ See a paper by Edm. Waterton, in *Arch. Jour.*, xx. p. 224.

² See NIELLO (vol. xvii. p. 494) for a cut of another specimen of an early ring decorated in a similar way.

³ See Waterton, in *Arch. Jour.*, xvi. p. 307.

⁴ The celebrated ring given to Essex by Queen Elizabeth was meant to be used for a similar purpose. It is set with a fine cameo portrait of Elizabeth cut in sardonyx, of Italian workmanship.

II. (which is well organized), national museum, institute of history, geography, and ethnology (1838), polytechnic institute, national educational museum, polytechnic school, military, naval, and normal schools, lyceum of arts, musical conservatory, geographical society, and astronomical and meteorological observatory deserve special mention. The great national library owes its foundation to the bequest of João VI., and now numbers upwards of 120,000 volumes open to the public daily (see *LIBRARIES*, vol. xiv. p. 530, where the lesser libraries are also mentioned). One of the pleasant features of the city is the abundant supply of excellent water distributed to numerous stately fountains in the streets and public squares. The chief aqueduct, begun in the middle of the 17th century, starts at Tijuca, about 12 miles distant, and crosses the valley (740 feet wide and 90 feet deep) between Monte de Santa Theresa and Monte de Santo Antonio by a beautiful double tier of arches (erected in 1750), which form a striking feature in some of the finest views of the city. Its entire length being covered in with stone work, the water is kept remarkably cool. As the city has extended, other aqueducts of less architectural pretensions have had to be constructed; and a good deal has been done by an English company in recent years to provide a proper system of sewers. The bay of Rio de Janeiro has been the subject of poetic panegyric ever since it was discovered; and the traveller who comes to it after a voyage round the world seems as susceptible to its charm as if it were his first tropical experience.¹ The actual entrance, between Fort St Juan and Fort Santa Cruz, is 1700 yards wide. Within there are fifty square miles of anchorage, or even more for vessels of light draught, the bay having a width varying from 2 to 7 miles and stretching inland from the sea for 16 miles. Its coast-line, neglecting minor indentations, measures 60 miles. Such a sheet of water would be beautiful anywhere; but, when on all sides it is surrounded by hills of the most varied contour, the beauty is enhanced a thousandfold. Its surface is broken by a large number of islands—from the Ilha do Governador (6 miles long and 2 broad; population 2500) down to the little cluster of the Jerubahibas.

Rio is the seat of the principal arsenal in the empire, and most of the Brazilian cruisers have been built in its dockyards. The roadstead for vessels of war is between Villegagnon Island, with its fort, and the islands at the north-east angle of the town called respectively Ilha das Cobras (Snake Island) and Ilha dos Ratos (Rat Island). On the north side of Ilha das Cobras is the naval arsenal with two large docks. On Ilha das Enchadas (Coaling Island) there is a fine commercial dock 385 feet long, on keel blocks, 45 feet wide at the entrance and 23 feet deep. Between 1846 and 1855 the average number of vessels that cleared from the port of Rio was over 680 with an average total burden of 221,280 tons. In 1867 1311 vessels (522,407 tons) entered and 1032 (596,663 tons) cleared; in 1883 1218 (1,220,330 tons) entered and 1067 cleared, while, besides, the coasting trade was represented by 1414 vessels (454,739) entering. England has the greatest share of the foreign shipping trade, Germany ranking next, and France third. How completely (in spite of the fact that Santos and Rio Grande have become more independent) Rio de Janeiro is the commercial as well as the political capital of Brazil is evident from the fact that the exports from Rio are on the average fully equal in value to those from the rest of Brazil; for instance, the value of the exports from the capital in 1859-60 was £5,933,850 out of £11,826,121 from the empire, in 1879-80 £10,566,800 out of £18,928,635, and in 1881-82 £7,550,966 out of

£18,522,050. To this large total coffee has long contributed 40-50 per cent., and in 1880-81 (an exceptional year) the ratio rose to 86 per cent. Though the coffee plant was not introduced till 1770, Brazil is the greatest coffee-producing country in the world, and Rio de Janeiro is consequently the largest coffee-exporting city. The other exports of moment are brandy (in decreasing quantities), sugar, hides, diamonds, tapioca (mainly to France), tobacco and cigars, medicinal herbs, gold dust, and jacaranda, rosewood, and other timbers. The imports comprise cotton goods, machinery, pitch pine, and petroleum. Among the comparatively few local industries are the weaving of coloured buckskins (by a German firm) and other woollen and half woollen stuffs, the extensive manufacture of artificial mineral waters and liquors, brewing, carriage-building, and hat-making. Rio de Janeiro is the terminus of the Dom Pedro II. Railway, and thus of nearly the whole railway system of the country; and it communicates regularly by steamer with Niterohi on the other side of the bay, which is the terminus of another line. The population of the municipality of Rio de Janeiro was in 1850 stated at 266,466, of which 205,906 were in the town proper; but this, like most of the earlier figures, appears to be an exaggeration, as the census in 1872 gave only 274,972, of which about 190,000 were in the town and suburbs, the slaves numbering 48,939 and the foreigners (mainly Germans, French, and Italians) 84,279. The Italian element has been rapidly increasing. The bulk of the population is Portuguese with a mixture of Negro blood. The native Indian races are scarcely represented.

The annual rainfall at Rio de Janeiro is about 60 inches, the greatest precipitation taking place in February (12 inches), and the least in August (under 1 inch). The monthly ranges of temperature for 1882 were—January 97°-68°, February 95°-63°, March 95°-69°, April 87°-64°, May 84°-60°, June 82°-59°, July 85°-59°, August 98°-54°, September 80°-50°, October 92°-59°, November 97°-59°, December 96°-62°.

The bay of Rio de Janeiro, the Niterohi or "Hidden Water" of the natives, was first observed on 1st January (hence the name) by Alphonso de Souza, who supposed, as the Rio indicates, that he had discovered the mouth of a large river. How Villegagnon in 1558 took possession of the island which now bears his name but was then called after his patron Coligny, and how his colony was destroyed by the Portuguese, has been told in the article *BRAZIL* (vol. iv. p. 229). The city of Rio de Janeiro did not become the capital of the viceroyalty till 1763, when José I. chose it in preference to Bahia because it was a better centre for defensive operations against the Spaniards. In 1711 it had been captured by Duguay-Trouin, who exacted 70,000 cruzados as ransom. It became the residence of the Portuguese royal family in 1808; in the same year its port was declared free to foreign trade; and in the course of a short time it was made by Dom João VI. the seat of so many important institutions that Portugal became jealous at finding the relation between mother country and colony practically reversed. When João VI. returned to Portugal and Pedro was declared emperor of Brazil in 1822, Rio de Janeiro naturally remained the capital of the new state. Ecclesiastically the city was at first (from the foundation of the church of São Sebastião by Mendo de Sá in 1567) subject to the diocese of Bahia (San Salvador). It was made a suffragan bishopric of Bahia by papal bull of 19th July 1576; and when Bahia was by the bull of 16th November 1676 created the metropolitan archbishopric of Brazil, Rio de Janeiro was (along with Pernambuco) declared a bishopric, the bishop's authority extending over the province of Espírito Santo northwards and southwards to the Rio de la Plata (Rio da Prata). The first bishop relinquished his dignity without taking possession; and the second did not reach his diocese till 1682, when he made the church of St Sebastian on the Castle Hill his cathedral. This distinction was in 1734 transferred to the Church of the Cross and in 1738 to that of the Rosary. A new cathedral was begun in 1749 by D. Frei Antonio do Desterro, but the works were discontinued on his death, and in 1840 the materials served for the military academy.

See Milliet de Saint-Adolphe, *Dictionnaire . . . do Imp. do Brazil*, Paris, 1845; G. Gardiner, *Travels in the Interior of Brazil*, 1846; Buemeister, *Reise nach Brasilien*, Berlin, 1853; Herbert H. Smith, *Brazil*, 1880; C. F. van Delden Laerne, *Brazil and Java*, 1885. (H. A. W.)

RIO GRANDE (that is, "Great River" in both Spanish and Portuguese), a descriptive epithet which in a vast number of cases has become a proper name. (1) **RIO GRANDE** (or **RIO BRAVO**) **DEL NORTE**, which rises in the Rocky Mountains between the La Plata and San Juan ranges in the south-west of Colorado, has a total course of about 1800 miles, and forms for 1100 miles the boundary between the United States and Mexico, but owing to the shallowness of its ordinary current is navigable for steamers only to Kingsbury's Rapids, 450 miles from the sea. (2) **RIO GRANDE DO NORTE**, or Potengi, or Potengi,

¹ "This bay," says Mr Gallenga, "is the very gate to a tropical paradise. There is nowhere so bold a coast, such a picturesque cluster of mountains, such a maze of inlets and outlets, such a burst of all-pervading vegetation. The city itself is like Lima or Buenos Ayres, a mere chess-board of shabby narrow streets. But the environs all round—the Botafogo Bay, the vale of Larangerias, the height of Tejuca, San Cristoval, Santa Teresa, and others . . . may well challenge comparison with any of the loveliest localities of either hemisphere. You are bidden drive out to the Botanic Gardens (at Botafogo), but the whole road inland or along the water is nothing but a continuous garden."

which gives its Portuguese name to a northern province of Brazil, rises in the Serra dos Cairiris-Novos, passes Natal, the capital of the province, and falls into the sea to the south of São Roque. (3) RIO GRANDE DO SUL, the outlet of the Lagoa dos Patos, wrongly supposed by the early explorers to be the mouth of a great river, gives its name to a city and province of Brazil (see below). (4) RIO GRANDE, a river of Western Africa, enters the sea opposite the Bissagos Archipelago (see SENEGAMBIA).

RIO GRANDE DO SUL, or in full SÃO PEDRO DO RIO GRANDE DO SUL, a city of Brazil, in the province of the same name, near the mouth of the estuary of Rio Grande. Including the suburbs it is a place of from 30,000 to 35,000 inhabitants (1880), with a considerable trade and various manufactures. The bar at the mouth of the "Rio" does not admit vessels of full 10-feet draught; but dredging operations undertaken by the Government in 1882 are considerably increasing the depth. In 1881–84 a railway was constructed from Rio Grande do Sul to Bage, 125 miles inland. The average annual value of the imports in the six official years ending June 30, 1882, was about £589,043, reckoning the milreis at 2s. In 1881 651 vessels (133,779 tons) crossed the bar inwards, and 555 (133,276) outwards. Among the foreign vessels the British are most numerous. The imports are very various, to supply the colonies of Germans, Italians, &c., settled throughout the province; the exports on the other hand are mainly hides, skins, bones, hair, tallow, &c.

Rio Grande do Sul was a long time the chief town of the captaincy of El Rei (which included both the present province of Rio Grande do Sul and that of Santa Catharina). It was first founded as an encampment of Portuguese troops in 1737 on the south side of the Rio Grande. The settlement was removed to its present site by Gomes Freire d'Andrade in 1745. The Spaniards occupied this part of the country from 1763 to 1776. In 1807 the two districts of São Pedro and Santa Catharina were united and erected into a province with São José de Porto Alegre for its chief town; and, though Rio Grande was declared a city in 1809, Porto Alegre retained its position even after the separation into two comarcas in 1812. The name of the province has been rendered familiar in Europe through the remarkable success which has attended the establishment of German and Italian agricultural colonies. In 1872 there were 36,458 foreigners in the province to 330,564 free-born Brazilians and 67,791 slaves; and by 1882 it was estimated that the German population alone amounted to 102,000, while the Italians, who began to immigrate in 1875, were rapidly approaching 50,000. The first German settlement was that of São Leopoldo on the Rio do Sino, founded by Dom Pedro I. in 1825. By 1880 the inhabitants numbered 5000, and in 1884 the town was made a municipality. Others of the same nationality are Novo Mundo (1850), Nova Petropolis (1858), Santa Maria da Soledade, Marato, São Benedito, São Salvador, Montenegro, Feliz, Teutonia (1858), Estrella (1856), Santa Cruz (1849), Mont Alverne, Germania, São Lorenzo (1858), Santa Clara, São Silvano, Domingos, &c. The principal Italian colonies are Caxias, Conde d'Eu, Donna Isabel, and Silveira Martins, which in 1884 had respectively 13,680, 6287, 9595, and 6000 inhabitants. The success of these colonies is one of the most important elements in the development of the Brazilian empire.

See works by Hörmeyer (Coblentz, 1854); Mulhall (London, 1873); Cantatt (Berlin, 1877); H. Lange (Leipzig, 1881); Richard Diltz (Berlin, 1882); for the Italian colonies, Breitenbach's paper in *Globus* (1885); and, for the Lagoa dos Patos, Ihering in *Deutsche geogr. Blätter* (Bremen, 1885).

RIOM, a town of France, with 9590 inhabitants, at the head of an arrondissement in the department of Puy-de-Dôme, 8 miles north of Clermont-Ferrand on the railway to Paris, occupies an eminence on the left bank of the Ambène (a left-hand tributary of the Allier) rising above the fertile plain of Limagne. It is surrounded with boulevards and has wide streets, but the houses, being built of black lava, have a rather sombre appearance. Some date from the 15th and 16th centuries, with turrets and ancient carved work. The church of St Amable goes back to the 12th century, but has suffered by repeated restorations. The old ducal palace (now occupied by the court of appeal, &c.) has a collection of portraits of Auvergne celebrities. A feature in the town is the fountains, of which some are

of the Renaissance period. Riom trades in the products of Limagne—grain, wine, hemp, preserved fruits, and especially a conserve of apricots—and has a tobacco manufactory.

Riom (*Ricomagus* or *Ricomum* of the Romans) was long the rival of Clermont. Along with Auvergne it was seized for the crown by Philip Augustus, and it was the capital of this province under the dukes of Berri and Bourbon. During the religious wars it long held with the League. Its courts of law, always famous, are associated with the memory of D'Aguesseau.

RIONERO IN VOLTURE, a city of Italy, in the province of Potenza, 4 miles from Atella, is pleasantly situated at the foot of Monte Volture, has the repute of being the best built and best kept of the towns of the Basilicata, and has long been distinguished by the industrious character of its inhabitants (11,383 in 1881). It does not seem to be older than the first half of the 17th century. In 1851 it suffered severely from the earthquake.

RIOT is "an unlawful assembly which has actually begun to execute the purpose for which it assembled by a breach of the peace and to the terror of the public. A lawful assembly may become a riot if the persons assembled form and proceed to execute an unlawful purpose to the terror of the people, although they had not that purpose when they assembled" (Stephen, *Digest of the Criminal Law*, art. 73). The above is the definition of a riot at common law in England. The offence is the most grave kind of breach of the peace known to the law, short of treason. In its previous stages it may be an affray, an unlawful assembly, or a riot, according to circumstances, and it may, if carried far enough, become treason. An affray is the fighting of two or more persons in the public street. An unlawful assembly is an assembly of three or more persons with intent to commit a crime by force or carry out a common purpose, lawful or unlawful, in such a way as to give reasonable grounds for fearing a breach of the peace. A rout is an unlawful assembly which has made a motion towards the execution of its common purpose. If the unlawful assembly should begin to demolish a particular inclosure, that would be a riot; if it should proceed to pull down all inclosures, that would be treason. It was considered as early as the 14th century that the common law gave an insufficient remedy against riot. In 1360 the statute of 34 Edw. III. c. 1 gave jurisdiction to justices to restrain, arrest, and imprison rioters. In 1393 the statute of 17 Ric. II. c. 8 conferred similar powers on the sheriff and *posse comitatus*. Numerous other Acts extending the common law were passed, especially in the Tudor reigns (see Stephen, *History of the Criminal Law*, vol. i. p. 202). The effect of existing legislation is to constitute certain statutory offences similar to riot at common law. The earliest Act now in force is one commonly called the Riot Act, 1 Geo. I. st. 2, c. 5. That Act makes it the duty of a justice, sheriff, mayor, or other authority, wherever twelve persons or more are unlawfully, riotously, and tumultuously assembled together to the disturbance of the public peace, to resort to the place of such assembly and read the following proclamation:—"Our Sovereign Lady the Queen chargeth and commandeth all persons being assembled immediately to disperse themselves, and peaceably to depart to their habitations or to their lawful business, upon the pains contained in the Act made in the first year of King George for preventing tumultuous and riotous assemblies. God save the Queen." It is a felony punishable with penal servitude for life to obstruct the reading of the proclamation or to remain or continue together unlawfully, riotously, and tumultuously for one hour after the proclamation was made or for one hour after it would have been made but for being hindered. The Act requires the justices to seize and apprehend all persons continuing after the hour, and indemnifies them

and those who act under their authority from liability for injuries caused thereby. Any prosecution for an offence against the Act must be commenced within twelve months after the offence.

By 24 & 25 Vict. c. 97, § 11, it is a felony punishable with penal servitude for life for persons riotously and tumultuously assembled together to the disturbance of the public peace to unlawfully and with force demolish or begin to demolish or pull down or destroy any building, public building, machinery, or mining plant. By § 12 it is a misdemeanour punishable with seven years' penal servitude to injure or damage such building, &c. A riotous assembly of three or more seamen unlawfully and with force preventing, hindering, or obstructing the loading or unloading or the sailing or navigation of any vessel, or unlawfully and with force boarding any vessel with intent to do so, constitutes a misdemeanour punishable with twelve months' hard labour, 33 Geo. III. c. 67. In addition to these Acts, there are others aimed at crimes of a somewhat similar nature, such as assembly for the purpose of smuggling, going armed in pursuit of game by night, forcible entry and detainer, political meetings in the city of Westminster, tumultuous petitioning, and unlawful drilling. For these offences see Stephen, *Digest of the Criminal Law*, art. 76-82.

It is the duty of a magistrate at the time of a riot to assemble subjects of the realm, whether civil or military, for the purpose of quelling a riot. In this duty he is aided by the common law, under which all subjects of the realm are bound to assist on reasonable warning, and by various enactments enabling the authorities to call out the auxiliary and reserve forces for the suppression of riot, and to close public houses where a riot is apprehended. It is his duty to keep the peace; if the peace be broken, honesty of intention will not avail him if he has been guilty of neglect of duty. The question is whether he did all that he knew was in his power and which could be expected from a man of ordinary prudence, firmness, and activity. The law as thus stated is gathered from the opinions of the judges on the trials of the lord mayor of London and the mayor of Bristol on indictments for neglect of duty at the time of the Gordon riots of 1780 and the Bristol riots in 1831.¹ In addition to his liability to an indictment at common law, a defaulting magistrate is subject under the provisions of 13 Hen. IV. c. 7 and 2 Hen. V. st. 1, c. 8, to a penalty of £100 for every default, the default to be inquired of by commission under the great seal. A matter of interest is the extent of the protection afforded by the Riot Act to soldiers acting under the commands of their officers. The soldier is at the same time a citizen, and the mere fact of his being a soldier is not sufficient to exonerate him from all responsibility. No case in which the question has called for decision seems to have arisen. It is the opinion of Mr Justice Stephen that a soldier would be protected by orders for which he might reasonably believe his superior officer to have good grounds (*History of the Criminal Law*, vol. i. 206). On the other hand, he would probably not be protected by an order plainly unnecessary, such as an order to fire into a crowd of women and children when no violence was observable.

The civil remedy given to those whose property has suffered by riot is of an exceptional character. The action is brought against the hundred in which the riot took place. This liability of the hundred is a survival of the pre-Conquest obligation of the hundred and tithing to pursue and do justice on the thief: the hundred is supposed to guarantee the orderly conduct of its inhabitants, and is liable to damages for its failure to preserve order. The liability of the hundred in case of robbery was enacted as early as the Statute of Winchester, 13 Edw. I. st. 2. That and subsequent Acts were repealed by 7 & 8 Geo. IV. c. 27, and their provisions were consolidated and amended by 7 & 8 Geo. IV. c. 31. The Act gives a remedy against the hundred in the case of any church, chapel, house, machinery, &c., being "feloniously demolished, pulled down, or destroyed, wholly or in part, by any persons riotously and tumultuously assembled together." A summary remedy is given for damage not exceeding £30. The remedy is extended to injury to threshing machines by 2 & 3 Will. IV. c. 72. It has been held that damage to a house will not entitle the owner to compensation from the hundred unless the intention of the rioters was to totally destroy the house.

The Riot Act does not extend to Ireland. But similar provisions are contained in the Act of the Irish Parliament of 27 Geo. III. c.

15, as amended by 5 & 6 Vict. c. 28. An offence peculiar to Ireland and punishable with penal servitude for life under the provisions of the Acts above mentioned is the sending of a notice, letter, or message exciting or tending to excite a riot. The Prevention of Crimes Act, 1882, enabled summary proceedings to be taken against rioters. The Act was temporary only, expiring with the session of Parliament 1885.

In Scotland a riot may be either rioting and mobbing or rioting and breach of the peace. The first is much the same as the riot of English law. "Mobbing consists in the assembling of a number of people and their combining against order and peace to the alarm of the lieges" (Macdonald, *Criminal Law*, 180). The second offence occurs where concourse or a common purpose are wanting. Numerous Acts against riot and unlawful convocation were passed by the Scottish parliament at different times, beginning as early as 1457. The Riot Act (1 Geo. I.) applies to Scotland. The liability of the county or burgh for destruction of property by riot is provided for by the Riot Act and by several Acts of Parliament of the reign of George III.

In the United States the law is based upon that of England. In some States there is a statutory proclamation for the dispersion of rioters in words almost identical with those of the British Riot Act. The city, town, or county, according to circumstances, is liable for the damage caused by rioters. In some cases a remedy over against the rioters is given by legislation. (J. Wt.)

RIPARIAN LAWS. By the law of England the property in the bed and water of a tidal river as high as the tide ebbs and flows at a medium spring tide is presumed to be in the crown or a grantee of the crown, generally the lord of a manor, and the bed and water of a non-tidal river are presumed to belong to the person through whose land it flows, or, if it divide two properties, to the riparian proprietors, the rights of each extending to mid-stream (*ad medium filum aquæ*). In order to give riparian rights, the river must flow in a defined channel, or at least above ground. The diminution of underground water collected by percolation does not give a cause of action to the owner of the land in which it collects, though he is entitled to have it unpolluted unless a right of pollution be gained against him by prescription. As a general rule a riparian proprietor, whether on a tidal or a non-tidal river, has full rights of user of his property. The most important limitations of these rights will be found under the headings **FISHERIES** and **NAVIGATION LAWS**. In both these cases the rights of the riparian proprietors are subject to the intervening rights of other persons. These rights vary according as the river is navigable or not, or tidal or not. For instance, all the riparian proprietors might combine to divert a non-navigable river, though one alone could not do so as against the others, but no combination of riparian proprietors could defeat the right of the public to have a navigable river maintained undiverted. It is proposed in this place to consider shortly the rights enjoyed by, and the limitations imposed upon, riparian proprietors, in addition to those falling under the head of fishery or navigation. In these matters English law is in substantial accordance with the law of other countries, most of the rules being deduced from Roman law. Perhaps the main difference is that running water is in Roman law a *res communis*, like the air and the sea. In England, owing to the greater value of river water for manufacturing and other purposes, it cannot be said to be common property, even though it may be used for navigation. The effect of this difference is that certain rights, public in Roman law, such as mooring and unloading cargo, bathing and towing, are only acquirable by prescription or custom in England. A hut might lawfully be built on the shore of a tidal river by Roman law; in England such a building would be a mere trespass.

The principal rights enjoyed by riparian owners as such are the right of increase of property by means of alluvion and the right of use of the water.

Alluvion is the gradual and imperceptible increase of land by deposit; a sudden and violent changing of the course of a stream by a flood does not change the property. The addition to property

¹ Reports of these trials will be found in Carrington and Payne's *Reports*, vol. v., p. 254.

by alluvion is occasionally of considerable practical importance. In the reign of Charles I. the estate of Lord Berkeley was increased by 300 acres left dry by the Severn. The land was claimed for the crown, but judgment was given in favour of Lord Berkeley. If an island be formed in the stream, it belongs to the proprietor to whose land it is nearest; if it be exactly in mid-stream, it belongs to the riparian proprietors equally. The right of use of the water of a natural stream cannot be better described than in the words of Lord Kingsdown:—"By the general law applicable to running streams, every riparian proprietor has a right to what may be called the ordinary use of water flowing past his land,—for instance, to the reasonable use of the water for domestic purposes and for his cattle, and this without regard to the effect which such use may have in case of a deficiency upon proprietors lower down the stream. But, further, he has a right to the use of it for any purpose, or what may be deemed the extraordinary use of it, provided he does not thereby interfere with the rights of other proprietors, either above or below him. Subject to this condition, he may dam up a stream for the purposes of a mill, or divert the water for the purpose of irrigation. But he has no right to intercept the regular flow of the stream, if he thereby interferes with the lawful use of the water by other proprietors, and inflicts upon them a sensible injury," (*Miner v. Gilmour*, 12 *Moore's Privy Council Cases*, 156). The rights of riparian proprietors where the flow of water is artificial rest on a different principle. As the artificial stream is made by a person for his own benefit, any right of another person as a riparian proprietor does not arise at common law, as in the case of a natural stream, but must be established by grant or prescription. The rights of a person not a riparian proprietor who uses land abutting on a river by the licence or grant of the riparian proprietor are not as full as though he were a riparian proprietor, for he cannot be imposed as a riparian proprietor upon the other proprietors without their consent. The effect of this appears to be that he is not entitled to sensibly affect their rights, even by the ordinary as distinguished from the extraordinary use of the water.

The limitations to which the right of the riparian proprietor is subject may be divided into those existing by common right, those imposed for public purposes, and those established against him by crown grant or by custom or prescription. Under the first head comes the public right of navigation, of anchorage and fishery from boats (in tidal waters), and of taking shell-fish (and probably other fish except royal fish) on the shore of tidal waters as far as any right of several fishery does not intervene. Under the second head would fall the right of eminent domain by which the state takes riparian rights for public purposes, compensating the proprietor, the restrictions upon the fishery rights of the proprietor, as by Acts forbidding the taking of fish in close time, and the restrictions on the ground of public health, as by the Rivers Pollution Act, 1876. The jurisdiction of the state over rivers in England may be exercised by officers of the crown, as by commissioners of sewers or by the Board of Trade under the Crown Lands Act, 1866. A bridge is erected and supported by the county authorities, and the riparian proprietor must bear any inconvenience resulting from it. An example of an adverse right by crown grant is a FERRY (*q.v.*) or a port. The crown, moreover, as the guardian of the realm, has jurisdiction to restrain the removal of the foreshore, the natural barrier of the sea, by its owner in case of apprehended danger to the coast. The rights established against a riparian proprietor by private persons must as a rule be based on prescription or custom, only on prescription where they are in the nature of profits *à prendre* (see *PREScription*). Among such rights are the right to bathe, to land, to discharge cargo, to tow, to dry nets, to beach boats, to take sand, shingle, or water, to have a sea-wall maintained, to pollute the water (subject to the Rivers Pollution Act). In some cases the validity of local riparian customs has been recognized by the legislature. The right to enter on lands adjoining tidal waters for the purpose of watching for and landing herrings, pilchards, and other sea-fish was confirmed to the fishermen of Somerset, Devon, and Cornwall by 1 Jac. I. c. 23. The digging of sand on the shore of tidal waters for use as manure on the land was granted to the inhabitants of Devon and Cornwall by 7 Jac. I. c. 18. The public right of taking or killing rabbits in the day-time on any sea bank or river bank in the county of Lincoln, so far as the tide extends, or within one furlong of such bank, was preserved by 24 & 25 Vict. c. 96, § 17. It should be noticed that rights of the public may be subject to private rights. Where the river is navigable, although the right of navigation is common to the subjects of the realm, it may be connected with a right to exclusive access to riparian land, the invasion of which may form the ground for legal proceedings by the riparian proprietor (see *Lyon v. The Fishmongers' Company*, *Law Reports—Appeal Cases*, vol. i., 662).

A freshwater lake appears to be governed by the same law as a non-tidal river. The preponderance of authority is in favour of the right of the riparian proprietors as against the crown.

Unlawful and malicious injury to sea and river banks, towing

paths, sluices, floodgates, milldams, &c., or poisoning fish is a crime under 24 & 25 Vict. c. 97.

Scotland.—The law of Scotland is in general accordance with that of England. One of the principal differences is that in Scotland, if a charter state that the sea is the boundary of a grant, the foreshore is included in the grant, subject to the burden of crown rights for public purposes. Persons engaged in the herring fishery off the coast of Scotland have, by 11 Geo. III. c. 31, the right to use the shore for 100 yards from high-water mark for landing and drying nets, erecting huts, and curing fish. Similar powers were given to those engaged in any white fish fishery by 29 Geo. II. c. 23; but the section of the Act giving these powers was repealed by the Sea Fisheries Act, 1868.

United States.—In the United States the common law of England was originally adopted, the State succeeding to the right of the crown. This was no doubt sufficient in the thirteen original States, where rivers of the largest size do not occur, but was not generally followed in later times when it had become obvious that English law was insufficient to meet the case of the vast rivers and lakes of North America. "In Pennsylvania, North Carolina, South Carolina, Iowa, Mississippi, and Alabama, it has been determined that the common law does not prevail, and that the ownership of the bed or soil of all rivers navigable for any useful purpose of trade or agriculture, whether tidal of fresh water, is in the State" (*Bouvier, Law Dict.*, s.v. "River"). The supreme court of the United States in 1857 declared constitutional an Act of Congress of 1845, extending the admiralty jurisdiction of the United States to all public navigable rivers and lakes where commerce is carried on between different States or with foreign nations (*The Propeller Genesee Chief v. Fitzhugh*, 12 *Howard's Reports*, 443). The right of eminent domain has been exercised to a much greater extent than in England in the acquisition of sites for mills under the powers of State legislation in encouragement of trade. Such a course has never been necessary in England (see *Angell, Law of Watercourses*, § 478). The law as to subterranean water seems to be still unsettled. Some State decisions have recognized a public right to moor vessels and place cargo on the shore. (J. W+.)

RIPH (רִיפּ), i.e., RABBENU YISHAK B. YA'AKOB HAKKOHEN¹ AL-PHASI OR AL-FEZI, after the death of his teachers the greatest rabbi of Africa, and subsequently of the Peninsula, in the 11th and 12th centuries, was born in 1013 at Kal'at-Ibn-Hammad near Fez, and died at Lucena in 1103. His teachers were the great rabbins Rabbenu Nissim and Rabbenu Hananeel, both of Kairawan (ob. 1055). What RASHI (*q.v.*) was to the Ashkenazic Riph was for the Sepharadic Jews,² not only a teacher of the deepest learning, but also one who made new paths altogether for the students of the Talmud. Otherwise these two great men differed widely from one another in their activity. Rashi left the Babylonian Talmud, corrections of the text excepted (which he, however, confined to his own commentary, and by which his own disciples and publishers corrected the Talmud text), in its old state. Al-phasi, however, first separated from it the Agadah, which he cast aside almost entirely, and then he sifted the Halakhah³ thoroughly, retaining only the practical part of it. Thus either title his book has received is correct, the *Little Talmud* or the *Decisions of Rab Al-phez*. Late in the 12th century and in the 13th a host of rabbins respectively attacked and defended Al-phasi (see *RABAD III.*, and *RAMBAN*), whilst others commented on him (see below). One of the commentaries accompanying the Riph is by Rashi. This commentary, however, which is now an integral part of the book, was not written for it by Rashi himself, who could scarcely have known of Riph's existence, and much less of his work. The fact is the enterprising publisher of the second edition (Venice, 1521–22, fol.), the famous Daniel Bombergi, had one of the three recensions which Rashi had made on the Talmud excerpted and applied to corresponding parts of the Riph which has the very wording of the Talmud, or something near it. Where no Rashi was to be found in the passages of the

¹ That Riph was a Kohen, or Aaronite, will be seen from the epitaph given in *Haggahoth Hariph* in the collection *Trumath Yesharim* (Venice, 1622, fol.).

² On these names see *MAHAR*, vol. xv. p. 293.

³ On these terms see *MIDRASH*, vol. xvi. p. 285, and *MISHNAH*, p. 503.

Talmud (see RASHI) RASHBAM (*q.v.*) was utilized. Riph was not only a great Talmudist, but also a man of the greatest magnanimity and highest morality, as may be seen from the following two facts. When R. Yishak Ibn Albalia, who had been his bitterest enemy, lay at the point of death, he recommended his son to Riph, who received him with the greatest kindness, and at once adopted him as son.¹ Again, when Riph himself was at the point of death he recommended to the congregation of Lucena for successor, not his own learned and virtuous son Ya'akov, but the yet more learned, though not more virtuous, R. Yoseph Ibn Migash,² who became the teacher of the teachers of MAIMONIDES (*q.v.*).

Although Riph's works which are known are only two, the editions of one of these and the commentaries thereon are very numerous; we can only mention a few of them.

I. *Hilekhot Rab Al-phez*. (1) With the *Novellæ* of Rabbenu Nissim b. Reuben, the *Decisions* of R. Mordekhai b. Hillel (see ROSH), the *Novellæ* of one of the disciples of Rabbenu Yonah, the commentaries of R. Yehonathan Hakkoheh of Lunel and R. Yoseph Habibo (Constantinople, 1509, fol.). (2) The second edition we have already mentioned. (3) With the *Strictures* by R. Zerayah Hallevi (author of the *Maor*) and Nachmanides's defence called *Milhamoth Adonai* (see RAMBAN), &c. (Venice, 1552, fol.). Each subsequent edition contains additional matter.

II. *Responsa*, originally some, if not all of them, written in Arabic (Leyhorn, 1781, and reprint, Vienna 1794, both in 4to).

For more literature by and on Riph see *Tenim De'im* in the collection *Tum-math Pesharim*. (S. M. S.-S.)

RIPLEY, a well-built market town of Derbyshire, situated near the river Derwent and the Cromford Canal, and on a branch line of the Midland Railway 10 miles north of Derby and 10 south of Chesterfield. The principal public building is the market-hall erected in 1880. In the neighbourhood there are extensive collieries, and coke is largely manufactured. Besides the large concern of the Butterley Iron Company, which includes foundries, blast furnaces, and boiler works, the town possesses silk and cotton mills. The charter for the market was granted by Henry III. The population of the urban sanitary district (area 1211 acres) in 1871 was 5639, and in 1881 it was 6087.

RIPLEY, GEORGE (1802–1880), critic and man of letters, was born at Greenfield, in western Massachusetts, on October 3, 1802. He was educated at local schools and at Harvard College, where he took his degree in 1823, ranking first in his class, and then studying theology was in 1826 ordained pastor of a Unitarian church in Boston. Here his success as a thoughtful preacher was marked; but in 1840 he resigned his charge, and he subsequently retired from the active ministry altogether.

It was during those years that there grew up in New England that form of thought or philosophy known as Transcendentalism—a name, as Emerson said, “given nobody knows by whom, or when it was applied.” Its growth was part of what Dr Holmes has termed the “intellectual or, if we may call it so, spiritual revival” which during the period from 1820 to 1840 was so strongly marked in the New England “churches, in politics, in philanthropy, in literature.” Ripley was prominent, if not the leader, in all practical manifestations of the movement; and it was by his earnestness and practical energy that certain of its more tangible results were directed. The first meeting of the Transcendental Club was held at his house in September 1836. He was a founder and a chief supporter of the famous magazine *The Dial*, which was the organ of the school from 1840 to 1844. Most important of all, however, he was the originator and conductor of an experiment which was the most interesting practical result of the thought and ten-

dencies of the time,—the foundation of “The Brook Farm Association for Education and Agriculture.” This project, in the words of its originator, was intended “to insure a more natural union between intellectual and manual labour than now exists; to combine the thinker and the worker, as far as possible, in the same individual; to guarantee the highest mental freedom by providing all with labour adapted to their tastes and talents, and securing to them the fruits of their industry; to do away with the necessity of menial services by opening the benefits of education and the profits of labour to all; and thus to prepare a society of liberal, intelligent, and cultivated persons whose relations with each other would permit a more simple and wholesome life than can be led amidst the pressure of our competitive institutions.” In short, its aim was to bring about the best conditions for an ideal civilization, reducing to a minimum the labour necessary for mere existence, and by this and by the simplicity of its social machinery saving the maximum of time for mental and spiritual education and development. At a time when Emerson could write to Carlyle, “We are all a little wild here with numberless projects of social reform; not a reading man but has a draft of a new community in his waistcoat pocket,”—the Brook Farm project certainly did not appear as impossible a scheme as many others that were in the air. At all events it enlisted the co-operation of men whose subsequent careers show them to have been something more than visionaries. The association bought a tract of land in West Roxbury, some ten miles from Boston, and with about twenty members actually began its enterprise in the summer of 1841.

For three years the undertaking went on quietly and simply, subject to few outward troubles other than financial difficulties, the number of associates increasing to seventy or eighty. Pictures of the life they led have been preserved by many hands. It was during this period that Hawthorne had his short experience of Brook Farm, of which so many suggestions appear in the *Blithedale Romance*, though his preface to later editions effectually disposed of the idea—which gave him great pain—that he had either drawn his characters from persons there, or had meant to give any actual description of the colony. Emerson, though he refused in a kind and characteristic letter to join in the undertaking, and though he afterwards wrote of Brook Farm with not uncharitable humour as “a perpetual picnic, a French Revolution in small, an age of reason in a patty-pan,” yet spoke of the design as “noble and generous,” and among its founders were many of his near friends.

In 1844 the growing need of a more scientific organization, and the influence which Fourier's doctrines had gained in the minds of Ripley and many of his associates, combined to change the whole plan of the community. It was transformed, with the strong approval of all its chief members and the consent of the rest, into a Fourierist “phalanx” in 1845. There was an accession of new members, a momentary increase of prosperity, a brilliant new undertaking in the publication of a journal, *The Harbinger*, in which Ripley, Charles A. Dana, Francis G. Shaw, and John Dwight were the chief writers, and to which Lowell, Whittier, George William Curtis, Parke Godwin, Story, Channing, Higginson, Horace Greeley, and many more now and then contributed. But the individuality of the old Brook Farm was gone. The association was not rescued even from financial troubles by the change. With increasing difficulty it kept on till the spring of 1846, when a fire which destroyed its building or “phalanstery” brought losses which caused, or certainly gave the final ostensible reason for, its dissolution. Its failure left Ripley poor and feeling keenly the defeat of

his project; but the event forced him at last to devote himself to that career of literary labour in which the real success of his life was achieved. He wrote for *The Harbinger* during the year of its continuance, but in 1849 he joined the staff of *The Tribune*, founded eight years before by Horace Greeley in New York, and in a short time became its literary editor. This position, which, through his steadiness, scholarly conservatism, and freedom from caprice as a critic, soon became one of great influence, he held until his death on July 4, 1880.

During the greater part of the time of his connexion with *The Tribune*, Ripley was also the adviser of a leading publishing house, an occasional contributor to the magazines, and a co-operator in several literary undertakings. The chief of these, and the most lasting work that bears his name, was the *American Cyclopædia*. Begun under the editorship of Ripley and Charles A. Dana in 1857, the first edition was finished in 1862, under the title of the *New American Cyclopædia*—distinguishing it from its only important American predecessor in the field, the small *Encyclopædia Americana* of many years before, which Dr Francis Lieber had edited, and which had been largely an adaptation of Brockhaus's *Conversations-Lexikon*. The new undertaking was upon a much larger scale, and enlisted a great number of well-known contributors. It proved exceedingly popular; and its commercial success led the publishers to undertake a complete revision of it ten years later—still under the same editors—the result of which, with the dropping of the word "new" from the title, was the *American Cyclopædia* now before the public.

Ripley's *Life*, written by the Rev. O. B. Frothingham, forms one of the volumes of the series *American Men of Letters*. (E. L. B.)

RIPON, a cathedral city and borough in the West Riding of Yorkshire, is situated at the confluence of the Ure with the Laver and the Skell, and on the Great Northern Railway, 22 miles north-west of York and 11 north of Harrogate. The Ure is crossed by a fine bridge of 9 arches. The streets are for the most part narrow and irregular, and, although most of the houses are comparatively modern, some of them still retain the picturesque gables characteristic of earlier times. In the spacious market-place there is a modern cross, erected in 1781. The cathedral, although not ranking among those of the first class, is celebrated for its fine proportions, and is of great interest from the various styles of architecture which it includes. Its entire length from east to west is 266 feet, the length of the transepts 130 feet, and the width of the nave and aisles 87 feet. Besides a large square central tower, there are two western towers. The cathedral was founded on the ruins of St Wilfrid's abbey about 680 A.D. in the reign of Egfrid, but of this Saxon building nothing now remains except the crypt, called St Wilfrid's Needle. The present building was begun by Archbishop Roger (1154–81), and to this Transition period belong the transepts and portions of the choir. The western front and towers, fine specimens of Early English, were probably the work of Archbishop Gray (1215–55), and about the close of the century the eastern portion of the choir was rebuilt in the Decorated style. The nave and portions of the central tower were rebuilt towards the close of the 15th century in the Perpendicular style. The whole building underwent renovation under the direction of Sir G. G. Scott from 1862 to 1876 at a cost of £40,000. There are a number of monuments of historical and antiquarian interest. The bishop's palace, a modern building in the Tudor style, is situated in extensive grounds about a mile from the town. The principal secular buildings are the town-hall, the public rooms, and the mechanics' institution. There are several old charities, including the hospital of St John the Baptist founded by the archbishop of York in 1109, the hospital of St Mary Magdalene for women founded by the archbishop of York in 1341, and the hospital of St Anne founded about the time of Edward IV. by an unknown benefactor. From an early period till the 16th century Ripon was celebrated for its manufactures of woollen cloth. After this industry declined the town

became so well known for its spurs that "as true steel as Ripon rowels" became a current phrase; and both Ben Jonson and Davenant refer to Ripon spurs in their verses. This manufacture, with those of buttons and various kinds of hardware, continued to prosper till the beginning of the present century, when the rise of the mechanical industries in the large towns caused it to decline. The population of the borough (area 1580 acres) in 1871 was 6806, and in 1881 it was 7390.

The city is first mentioned under the name of *Inhyrpyum* in connexion with the establishment of a monastery in 660 by Abbot Eata of Melrose. A few years after it was bestowed on St Wilfrid, who was elevated to the see of Northumbria. After the division of the bishopric in 678, a see was erected at Ripon. The city suffered severely in connexion with the incursions of the Danes and the invasion of William the Conqueror, and was burnt by Robert Bruce in 1319 and 1323. During the Civil War it was for a time occupied by the Parliamentary forces, but it was retaken by the Royalists in 1643. It was first represented in parliament in the reign of Edward I. It lost one of its two members in 1868, and ceased to be separately represented in 1885. Surrounding the town is an extensive district called the liberty of Ripon, over which the archbishop of York at one time exercised special jurisdiction, not yet altogether annulled. The present bishopric dates from 1836.

RIPPERDA, JOHN WILLIAM, BARON (1680–1737), a political adventurer, was born of noble parents in the province of Groningen in the Netherlands, in 1680, and was educated in the college of the Jesuits at Cologne. Shortly after leaving the college he married a Protestant, and assumed the Protestant creed. In 1715 he was sent by the states on an embassy to Spain. Having gained the favour of Philip V., he resigned the office of Dutch ambassador, became a penitent convert to the Catholic faith, and took up his permanent residence in Madrid. He made use of every influence to advance himself to the first position at court, and if possible to supplant Alberoni, who, provoked by his intrigues, deprived him of his pension and estate. After the fall of Alberoni he succeeded in ingratiating himself with the queen, Elizabeth of Parma. Returning from an embassy to Vienna in 1725, he pretended to the queen that he had effected her favourite scheme of betrothing her son Don Carlos to the eldest archduchess. His immediate elevation to a dukedom and to the office of prime minister compelled him to persist in this imposture. Lie was backed up by lie; the nation was impoverished to furnish him with hush-money; and he continued to try every bungling shift until, in May 1726, he was deprived of his offices, and sent a prisoner to Segovia. Making his escape after two years' imprisonment, he went to England. His hopes of influence there having been overthrown by the treaty of Seville in 1729, he finally collected his property and set sail for Holland, arriving at The Hague in November 1731. Thence he sailed to Morocco, where he was welcomed by the emperor Muley Abdallah, and, becoming a Moham-medan, was placed at the head of the administration of the country. But his royal patron was soon driven from the throne, and he himself was glad to escape with his head to Tetuan, where he could find no better employment for his restless spirit than that of asserting himself to be the last and greatest of the prophets. He died at Tetuan towards the end of 1737.

RIPUARIAN LAW. See **SALIC LAW**.

RIST, JOHANN (1607–1667), German hymn-writer, was born at Ottensen in Holstein on March 8, 1607, and educated at Hamburg, Bremen, Leyden, Utrecht, and Leipsic. In 1635 he became a preacher at Wedel on the Elbe, and there he died on 31st August 1667 (see **HYMNS**, vol. xii. pp. 586–7).

RITSCHL, FRIEDRICH WILHELM (1806-1876), an eminent German scholar, was born in 1806 in Thuringia. His family, in which culture and poverty were hereditary, were Protestants who had immigrated several generations earlier from Bohemia. Ritschl was fortunate in his school training, at a time when the great reform in the higher schools of Prussia had not yet been thoroughly carried out. His chief teacher, Spitzner, a pupil of Gottfried Hermann, divined the boy's genius and allowed it free growth, applying only so much either of stimulus or of restraint as was absolutely needful. After a wasted year at the university of Leipsic, where Hermann stood at the zenith of his fame, Ritschl passed in 1826 to Halle. Here he came under the powerful influence of Reisig, a young "Hermannianer" with exceptional talent, a fascinating personality, and a rare gift for instilling into his pupils his own ardour for classical study. The great controversy between the "Realists" and the "Verbalists" was then at its height, and Ritschl naturally sided with Hermann against Boeckh. The early death of Reisig in 1828 did not sever Ritschl from Halle, where he brilliantly attained the doctorate, and in 1829 became privat-docent, in 1832 an extraordinary professor. He began his professorial career with a great reputation and brilliant success, but soon hearers fell away, and the pinch of poverty compelled his removal to Breslau, where he reached the rank of "ordinary" professor in 1834, and held other offices. The great event of Ritschl's life was a sojourn of nearly a year in Italy (1836-37), spent in libraries and museums, and more particularly in the laborious examination of the Ambrosian palimpsest of Plautus at Milan. From this journey Ritschl's whole temperament and intellect received a new and richer colouring, and the remainder of his life was largely occupied in working out the material then gathered and the ideas then conceived. Bonn, whither he removed on his marriage in 1839, and where he remained for twenty-six years, was the great scene of his activity both as scholar and as teacher. The philological seminary which he controlled, although nominally only joint director with Welcker, became a veritable *officina litterarum*, a kind of Isocratean school of classical study; in it were trained many of the foremost scholars of the last forty years. The names of Georg Curtius, Ihne, Schleicher, Bernays, Ribbeck, Lorenz, Vahlen, Hübner, Bücheler, Helbig, Benndorf, Riese, Windisch, Brugmann, who were his pupils either at Bonn or at Leipsic, attest his fame and power as a teacher. In 1854 Otto Jahn took the place of the venerable Welcker at Bonn, and after a time succeeded in dividing with Ritschl the empire over the philological school there. The two had been friends, but after gradual estrangement a violent dispute arose between them in 1865, which for many months divided into two hostile forces the universities and the press of Germany. Both sides were steeped in fault, but Ritschl undoubtedly received harsh treatment from the Prussian Government, and pressed his resignation. He renounced not only Bonn but Prussia, though strongly attached to his country, which he had often refused to leave when plied with advantageous offers. He accepted a call to Leipsic, where he died in harness in 1876.

Ritschl's character was strongly marked. The spirited element in him was powerful, and to some at times he seemed overbearing, but his nature was noble at the core; and, though intolerant of inefficiency and stupidity, he never asserted his personal claims in any mean or petty way. He was warmly attached to family and friends, and yearned continually after sympathy, yet he established real intimacy with only a few. Both at Breslau and at Bonn he complained of isolation, which (though he was himself unconscious of the fact) was in part the natural fruit of his own superiority. The interests of his pupils were at all times dear, perhaps even too dear, in his eyes. He was far from being a dreamy scholar; his talent for practical affairs would have secured him eminence in

almost any walk of life, and he was credited with diplomatic finesse. That Ritschl had a great faculty for organization is shown by his administration of the university library at Bonn, and by the eight years of labour which carried to success a work of infinite complexity, the famous *Priscæ Latinitatis Monumenta Epigraphica* (Bonn, 1862). This volume presents in admirable facsimile, with prefatory notices and indexes, the Latin inscriptions from the earliest times to the end of the republic. It forms an introductory volume to the Berlin *Corpus Inscriptionum Latinarum*, the excellence of which is largely due to the precept and example of Ritschl, though he had no hand in the later volumes.

In all that he did Ritschl exhibited rare genius combined with a precision unsurpassed. But to bring out to the full his great powers the zest of discovery was indispensable. When he was on the track of a new idea, he worked with a fiery energy which triumphed over his almost life-long physical weakness, and left him no peace till every difficulty was cleared away. But the toil of carrying his discoveries to their consequences he was only too apt to leave to feeble hands than his own. He was fertile in great projects, and struck out the main ideas which should guide them, but one only did he pursue to absolute completion, the *Priscæ Latinitatis Monumenta*,—precisely because, from the nature of this work, he was buoyed up from first to last by the occurrence or the expectation of novelty. The results of Ritschl's life are mainly gathered up in a long series of monographs, for the most part of the highest finish, and rich in ideas which have leavened the scholarship of the time.

As a scholar, Ritschl was of the lineage of Bentley, to whom he looked up, like Hermann, with fervent admiration. His best efforts were spent in studying the languages and literatures of Greece and Rome, rather than the life of the Greeks and Romans. He was sometimes, but most unjustly, charged with taking a narrow view of "Philologie." That he keenly appreciated the importance of ancient institutions and ancient art both his published papers and the records of his lectures amply testify. He had in reality no prejudice against any department of learning. He was ever anxious to discern precisely the work for which each pupil was fitted, and he despatched many explorers into fields where he could not labour himself. Ritschl for the most part devoted himself to the study of ancient poetry, and in particular of the early Latin drama. This formed the centre from which his investigations radiated. Starting from this he ranged over the whole remains of pre-Ciceronian Latin, and not only analysed but augmented the sources from which our knowledge of it must come. Before Ritschl the acquaintance of scholars with early Latin was so dim and restricted that it would perhaps be hardly an exaggeration to call him its real discoverer.

To the world in general Ritschl was best known as a student of Plautus. When he began his studies, the text of that author was like some ancient picture, defaced alike by time and by much repainting. He cleared away the accretions of ages, and by efforts of that real genius which goes hand in hand with labour, brought to light many of the true features of the original. It is infinitely to be regretted that Ritschl's results were never combined to form that monumental edition of Plautus of which he dreamed in his earlier life. For one such palace from the master builder's hand we could well have sacrificed some of the abundant material which he left for punier architects to handle. Ritschl's examination of the Plautine MSS. was both laborious and brilliant, and greatly extended the knowledge of Plautus and of the ancient Latin drama. Of this two striking examples may be cited. By the aid of the Ambrosian palimpsest he recovered the name T. Maccius Plautus, for the vulgate M. Accius, and proved it correct by strong extraneous arguments. On the margin of the Palatine MSS. the marks C and DV continually recur, and had been variously explained. Ritschl proved that they meant "Canticum" and "Diverbium," and hence showed that in the Roman comedy only the conversations in iambic senarii were not intended for the singing voice. Thus was brought into strong relief a fact without which there can be no true appreciation of Plautus, viz., that his plays were comic operas rather than comic dramas.

In conjectural criticism Ritschl was inferior not only to his great predecessors but to some of his contemporaries. His emendations do not often present that perfect wedding of art and fortune which we see in the best work of Madvig or Cobet. His imagination was in this field (but in this field only) hampered by erudition, and his judgment was unconsciously warped by the desire to find in his text illustrations of his discoveries. His remedies were often needlessly violent. But still a fair proportion of his textual labours has stood the test of time, and he forged the weapons which are destined to conquer for us the true text of Plautus, so far as an envious fate permits. Ritschl rendered immense service by his study of Plautine metres, a field in which little advance had been made since the time of Bentley. In this matter Ritschl was aided by an accomplishment rare (as he himself lamented) in Germany—the art of writing Latin verse.

In spite of the incompleteness, on many sides, of his work.

Ritschl must be assigned a place in the history of learning among a very select few. His studies are presented principally in his *Opuscula* collected partly before and partly since his death. The *Trinummus* (twice edited) was the only specimen of his contemplated edition of Plautus which he completed. The edition has been continued by some of his pupils—Goetz, Loewe, and others—and is still (1885) in progress.

The facts of Ritschl's life may be best learned from the elaborate biography by Otto Ribbeck (Leipsic, 1879). An interesting and discriminating estimate of Ritschl's work is that by Lucian Mueller (Berlin, 1877). (J. S. R.)

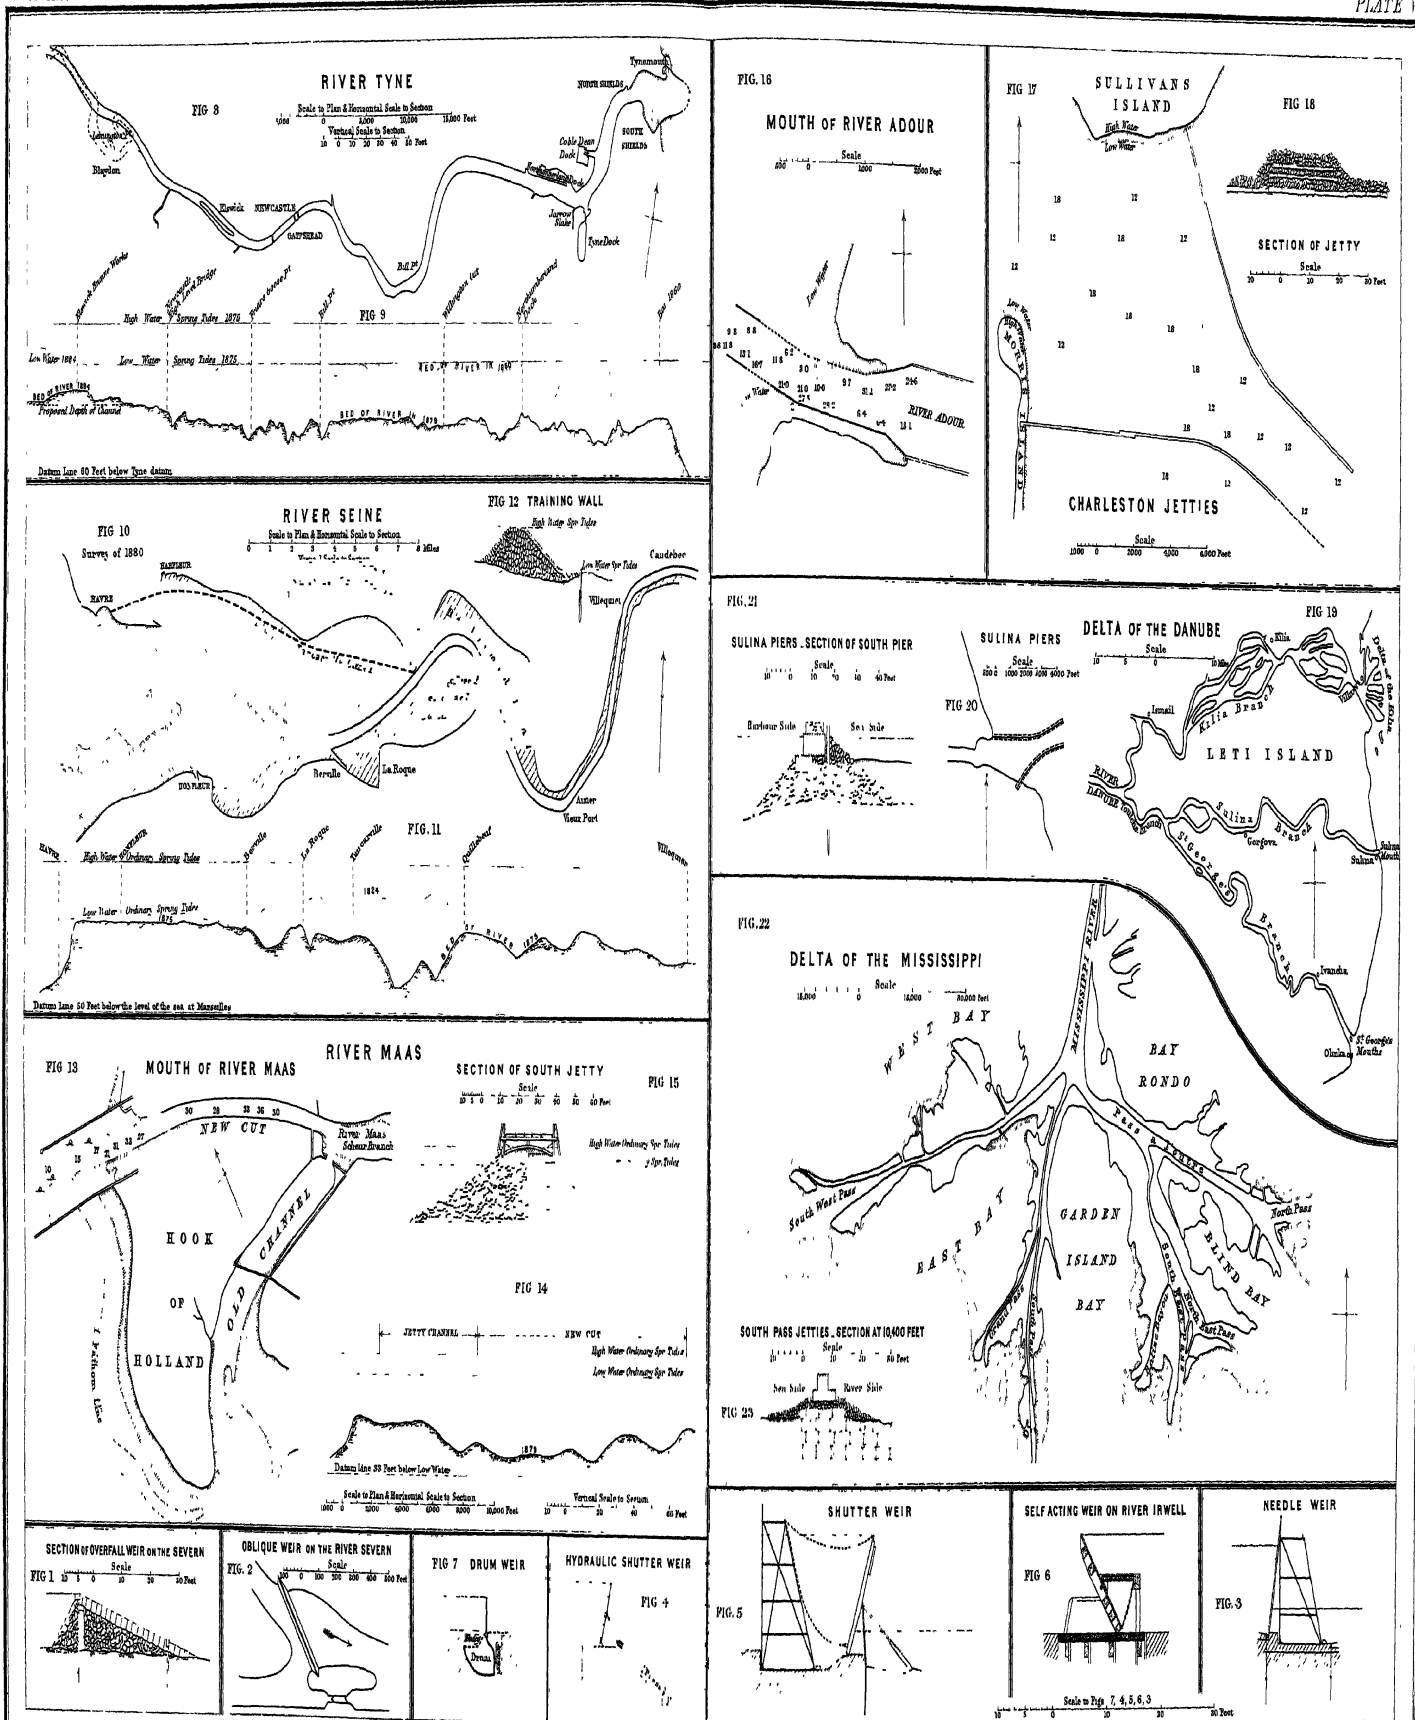

RITSON, JOSEPH (1752–1803), was the most militant and ill-tempered, and at the same time one of the most learned and accurate, of the antiquaries of the 18th century. Born at Stockton-on-Tees, of a Westmoreland yeoman family, in 1752, he was bred to the law, and settled in London as a conveyancer at the age of twenty-two. Already he had shown eccentricity of temper, had become a fierce apostle of vegetarianism, and a zealous student of antiquities. His first notable publication was in 1782, an attack on Warton's *History of English Poetry*. The fierce and insulting tone of his *Observations*, in which Warton was treated as a showy pretender, and charged with cheating and lying to cover his ignorance, made a great sensation in literary circles. In nearly all the small points with which he dealt Ritson was in the right, and his corrections have since been adopted, but the unjustly bitter language of his criticisms roused great anger at the time, much, it would appear, to Ritson's delight. In the following year Johnson and Steevens were assailed in the same uncere-monious fashion for their text of Shakespeare. Bishop Percy was next subjected to a furious onslaught in the preface to a collection of *Ancient Songs* (printed 1787, dated 1790, published 1792). The only thing that can be said in extenuation of Ritson's unmatched acrimony is that he spared no pains himself to ensure accuracy in the texts of old songs, ballads, and metrical romances that he edited. His collection of the Robin Hood ballads is perhaps his greatest single achievement. Scott, who admired his industry and accuracy in spite of his temper, was almost the only man who could get on with him. On one occasion, when he called in Scott's absence, he spoke so rudely to Mrs Scott that Leyden, who was present, threatened to "thraw his neck" and throw him out of the window. Spelling was one of his eccentricities, his own name being an example: Ritson is short pronunciation for Richardson. He died in 1803.

RITTENHOUSE, DAVID (1732–1796), astronomer, was born at Germantown, Pennsylvania, on April 8, 1732. First a watchmaker, he afterwards became treasurer of Pennsylvania and (from 1792) master of the United States mint; he was largely occupied in settling the boundaries of several of the States. As an astronomer, Rittenhouse's principal merit is that he introduced the use of spider lines in the focus of a transit instrument. His priority with regard to this useful invention was acknowledged by Troughton, who brought spider lines into universal use in astronomical instruments (see Von Zach's *Monatliche Correspondenz*, vol. ii. p. 215), but Felice Fontana (1730–1805) had already anticipated the invention, though no doubt this fact was unknown to Rittenhouse. He died on 26th June 1796.

RITTER, CARL (1779–1859), the greatest geographer of modern times, was born at Quedlinburg on August 7th, 1779, and died in Berlin, September 29th, 1859. His father, a physician of some local eminence, having died, leaving his family in somewhat straitened circumstances, Carl, along with an elder brother and a young man, Johann Gutsmuths, who had been his private tutor, was received into the Schnepfenthal institution then just founded by Salzmann for the purpose of putting his educational theories to the test of experience. Gutsmuths, who had continued to teach his pupils without remuneration after

their father's death, remained their special guardian and instructor at Schnepfenthal, and in his letters to their mother every little detail of their mental development is affectionately recorded. The Salzmann system was practically that of Rousseau: conformity to natural law and enlightenment were its watchwords; great attention was given to practical life; and the modern languages were carefully taught to the complete exclusion of Latin and Greek. In 1787 Gutsmuths reports about Carl that, "while not much of a hand at making money [trading with counters for coin was a regular branch of the Schnepfenthal education], he draws better maps than the biggest boys, and is making great strides towards becoming a professor of geography." When his school days were drawing to a close his future course was determined in a curious way by an introduction to Bethmann Hollweg, a banker in Frankfort. It was arranged that Ritter should become tutor to Hollweg's children, but that in the meantime he should attend the university at his patron's expense. In October 1796 he accordingly bade adieu to Schnepfenthal, and his next two winters were spent at Halle, where he resided in the house of Professor Niemayer, then at the height of his fame, and attended the lectures of Rüdiger on statistics and science, Sprengel on European history, Meinert on scientific agriculture, &c. His duties as tutor in the Hollweg family began at Frankfort in 1798 and continued for the next fifteen years. In one matter he went directly counter to the Salzmann theory: he gave a large place to the study of the ancient classics, of which he had grown passionately fond. The years 1814–1819, which he spent at Göttingen in order still to watch over the welfare of his pupils, were those in which he began to devote himself exclusively to geographical inquiries. In accordance with a promise exacted by Pestalozzi (with whom he had become acquainted at Yverdon on one of his many tutorial tours) he had several years previously drawn up a manual of physical geography in which many features of his later work are to be traced, but the book was not published. He now brought out his first masterpiece, *Die Erdkunde im Verhältniss zur Natur und zur Geschichte des Menschen* (Berlin, 2 vols., 1817–1818). In 1820 he was called to be professor extraordinarius of history at Berlin, where shortly afterwards he began also to lecture on statistics at the military college. He remained in this position till his death.

The service rendered to geography by Ritter was mainly three-fold. His personal influence, due largely to the moral character of the man and partly to the skill of the teacher, was unusually potent on those who came within its range during the long years that he acted as a professor. Had he done nothing more than use this influence in disseminating the geographical ideas of his time he would have stood high with his own generation. But, secondly, his investigations and teaching were informed by a fresh conception of his subject which imparted life to what had been its dry bones and dust. Geography was, to use his own expression, a kind of physiology and comparative anatomy of the earth: rivers, mountains, glaciers, &c., were so many distinct kinds of organs, each with its own appropriate functions; and, as his physical frame is the basis of the man, determinative to a large extent of his life, so the structure of each country is a leading element in the historic progress of the nation. This naturally led him to attach great importance to the vertical as distinguished from the horizontal development of the earth's surface, and also to give perhaps quite as much attention to the history of civilization and of the individual animals and plants by which civilization has been affected as to questions of purely physical geography. And, thirdly, he was a scientific compiler of the first rank. Such portions of his universal geography as he completed remain each the standard thesaurus for its territory. This is especially the case with the sections devoted to Palestine and to Central Asia. Among Ritter's minor works may be mentioned *Vorhalle europäischer Völkergeschichten vor Herodot* (Berlin, 1820); *Die Stupas . . . an der indobaktrischen Königsstrasse u. d. Kolosse von Bamiyan* (1838); *Einleitung zur allgemeinen vergleichenden Geographie* (Berlin, 1852); "Bemerkungen über Veranschaulichungsmittel räumlicher Verhältnisse bei graphischen Darstellungen durch Form u. Zahl," in the *Trans.* of the Berlin Academy, 1828. After his death Daniel published selec-

tions from his lectures under the titles *Geschichte der Erdkunde* (1851), *Allgemeine Erdkunde* (1862), and *Europa* (1863). Several of his works (e.g., the "Palestine" volumes of his *Erdkunde*) have been translated into English.

See Kramer, *Carl Ritter, ein Lebensbild* (1864 and 1870, 2d ed. 1875); Gage, *The Life of Carl Ritter* (Edinburgh, 1867); Guyot, *Carl Ritter, an address to the American Geogr. and Stat. Soc.* (Princeton, 1860); F. Marthe, "Was bedeutet Carl Ritter für die Geographie," in *Zeitsch. der Ges. f. Erdk.*, Berlin, 1879.

RIVAROL, ANTOINE DE (1753-1801), was born at Bagnols in Languedoc on the 26th June 1753, and died at Berlin on the 13th April 1801. It seems to be undisputed that his father was an innkeeper, but no researches have thrown any certain light on the question of his origin; later he assumed the title of Comte de Rivarol, and attributed himself to a noble family of Italian origin. His enemies declared that the family name was really Riverot, and that, whether Italian or not, it had nothing whatever to do with countship. It is certain that he bore several names, and that when he was among the foremost defenders of aristocracy his claim to share in it was by no means allowed by his associates. He was well educated, and is said to have been admitted by the bishop of Uzès to a theological seminary, then to have held a tutorship at Lyons under the name of Longchamps, then to have appeared in Paris under the further travesty of Chevalier de Parcieux with no better reason than that his mother was related to a man of science of that name. All this, however, is of very little consequence; it is sufficient that he appeared in Paris in 1780 (just when the operation of liberal ideas was throwing society most freely open to men of letters), with youth, good address, fair knowledge, and a very unusual stock of wit and literary ability. After competing for and sometimes winning several of the academic prizes then in greatest vogue, Rivarol distinguished himself in the year 1784 by a treatise *Sur l'universalité de la langue Française* (which shows, if not much learning, the utmost critical acumen and a very happy faculty of expression), and by a translation of the *Inferno*, very free but of no small merit. The year before the Revolution broke out he, with some assistance from a man of similar but lesser talent, Champcenetz, compiled a lampoon entitled *Petit Almanach de nos grands Hommes pour 1788*, in which some writers of actual or future talent and a great many nobodies were ridiculed in the most pitiless manner. It made him many enemies, but scarcely more than his speeches in society had made. When the Revolution developed the importance of the press, Rivarol at once took up arms on the royalist side. The *Journal Politique* of Sabatier de Castres and the *Actes des Apôtres* of Peltier were the chief papers in which he wrote. But he emigrated early in June 1792, and established himself at Brussels, whence he removed successively to London, Hamburg, and Berlin. For ten years he occupied himself not too strenuously with political pamphlets and literary projects, receiving pensions for his services to the royalist cause. He had married an Englishwoman, but had quarrelled with her, and during his later years had for his companion a pretty but totally uneducated girl named Manette, to whom he addressed certain often-quoted verses which are nearly poetry. Rivarol's genius, however, was essentially a genius of prose, though not a prosaic genius. No single work of his of any length has very great merit, and he is accordingly only known to posterity by volumes of "beauties" and selections, composed of epigrammatic remarks, short passages of criticism, and the like. Rivarol could not tell an anecdote with quite the point of his contemporary and rival Chamfort; but he has had no rival in France except Piron, and none in England except Sydney Smith, in sharp isolated conversational sayings. These were mostly ill-natured, and in some cases the full appreciation of them demands a more considerable acquaintance with the facts and men of the time than most readers possess. The brilliancy of Rivarol's

phrase, however, can escape no one. Burke was hyperbolic, and not altogether happily hyperbolic, in calling him the Tacitus of the Revolution, because the description suggests a power of historical portrait painting which Rivarol did not possess. But the expression no doubt really referred to the detached phrases which are so striking in Tacitus, and which Rivarol did in truth sometimes equal.

The works of Rivarol were published in five volumes by his friend Chénédollé (who has reported much remarkable conversation of his in his last days) and Fayolle (Paris, 1805); but their perusal as a whole can only be recommended to the student of literature. Selections are frequent: that published by De la Hays (Paris, 1858), with introductory matter by Sainte-Beuve and others, and that edited in 1862 by M. de Lescure, may be specified. The last-named editor published, in 1883, a study on *Rivarol et la Société Française*, which is the fullest treatment of the subject.

RIVE DE GIER, a town of France, in the department of Loire, situated 13 miles to the east-north-east of St Étienne, on the Lyons Railway at the head of the canal of Givors on the Gier. The town, which is constantly enveloped in a dense cloud of smoke, and presents a dirty and unattractive appearance, is principally dependent on the coal industry, there being fifty pits in the basin of the Gier, with an annual output of over 19,000,000 bushels. There are twenty-two coke and lamp black furnaces, and five glass works, the products of which—coloured glass and so-called Nuremberg mirrors—are celebrated, on account of the fineness and purity of the sand found on the banks of the Rhone and the Saône. Mining machinery, railway plant, and coarse ironmongery are also manufactured, and there are iron and steel works. A large number of persons are also employed in winding and spinning silk and in tape-weaving. The population in 1881 was 15,760.

Rive de Gier is a place of some antiquity, as appears from remains of Gallo-Roman buildings, and mosaics and coins found at various times. In the 11th century the canons of Lyons were its superiors. At a later period the town was surrounded by a wall and protected by a fortress, of which, however, but few traces are visible. In the time of Henry IV. the working of the mines had already given to the locality a measure of importance which has steadily increased. At one time it was feared that the coal basin, which was considered distinct from that of St Étienne, would soon be exhausted, but it has now been proved that the two are in reality one, and that they have a long future before them.

RIVER. See GEOLOGY, vol. x. p. 272-278.

RIVER ENGINEERING. The improvement of rivers Plate V. may be considered under two aspects, for rivers form the natural channels for conveying the surplus rainfall from the districts through which they pass to the sea, and they can also be utilized for the purposes of inland navigation. If a river, owing to the small section of its channel, or the slight inclination of its bed, is incapable of discharging the whole volume of water which drains into it in rainy seasons, the lands along its banks become flooded, frequently to the great detriment of the crops, and sometimes with disastrous results to life and property. If, on the other hand, a river is impeded by rapids, by shoals, or by a bar at its mouth, it is prevented from serving as a natural highway for the traffic of the district through which it flows. Accordingly the mitigation of floods and the regulation of rivers are the problems which have to be grappled with in the engineering of rivers. The first aims at remedying an existing evil, and the second deals with the development of the resources and trade of a country by the improvement of its water communications.

Floods.—Floods are of two kinds, according to the nature of the country traversed by the rivers producing them. Two kinds of floods. Tor-
rential rivers, flowing over impermeable strata and having a rapid fall, rise rapidly after a heavy rainfall, and produce a high flood which quickly subsides. Gently flowing rivers on the contrary rise slowly, and do not attain the same height as torrential rivers; but their floods subside slowly, and consequently, though less high, remain longer.

on the land than torrential floods. The valleys, moreover, of torrential rivers are steeper and less fertile than the alluvial plains of gently flowing rivers; and, consequently, the high short floods of the former are less injurious than the long continuing lower floods of the latter. The long duration of a flood is also the more prejudicial, as sometimes a flood remains long enough on the land for a second flood to come down before the first has subsided, thereby producing an increased rise.

Winter and summer floods. Floods are generally largest in the winter months, for, owing to the absence of evaporation, a much larger proportion of rainfall finds its way into the rivers at that period; and the greatest floods occur when rain falls on melting snow. High floods, however, sometimes occur in the summer after an exceptionally heavy rainfall; and they are necessarily far more injurious at that time of the year, devastating the crops on the land which they inundate.

Causes of floods. Floods are due to the inadequacy of the river channel to carry off the water poured into it within a given period. The bed of a river, being formed and maintained by its stream, is merely adequate to carry the ordinary discharge. Large floods occur at too distant intervals to scour a sufficient channel for their passage, and consequently they overflow the banks and inundate the adjacent districts. Other causes, moreover, tend to aggravate this evil.

A river carries down a large amount of solid matter which has been either ground from the mountain rocks by glaciers, washed from the land by the inflowing streams, or thrown into it as refuse from towns and manufactories. This material tends to settle in the channel wherever the current is checked, and consequently raises its bed and impedes the flow of the stream. Moreover, a river flowing through a plain gradually increases its serpentine course, thereby diminishing its fall and reducing its velocity. Accordingly the tendency of rivers is to deteriorate when left to themselves; and the discharging capacity of their channels becomes less, whilst the extension of subsoil drainage causes the rain to flow more rapidly and completely into the river upon whose basin it falls.

The available fall of the river is frequently diminished by the erection of fixed weirs across the channel, at various places, for the purpose of forming a head of water for mills, or of providing still-water navigation. These weirs are generally constructed with high sills, and of inadequate width; and where flood openings closed by draw-doors are adopted the doors are frequently not fully raised till a flood has actually arrived. These weirs consequently not merely reduce the discharging capacity of the channel by diminishing the available fall of the water surface, but also actually restrict the section of the channel. The result is that floods occur more frequently, rise higher, and remain on the land for a longer period.

Extent of prevention. *Prevention of Floods.*—The entire prevention of floods would entail a larger expenditure than the results would justify. In most cases, the prevention of summer floods and the mitigation of winter floods would suffice; for, whilst summer floods are always very injurious, winter floods prove sometimes beneficial in depositing the mud which they bring down, provided they do not remain very long upon the land. Occasionally, however, where large tracts of low-lying country are exposed to inundation, and especially where portions of towns are below the flood level, it is necessary to extend the protection so as to ensure entire immunity from floods.

Methods of prevention. There are three methods by which floods may be prevented or mitigated, namely,—(1) improvement of channel; (2) embankment of channel; (3) pumping.

(1) *Improvement of Channel.*—The discharging capacity

of a river may be increased by enlarging the section of its channel; by the formation of straight cuts, which reduce its length, and consequently increase its fall; by dredging away shoals, and thus rendering the fall of its bed more uniform; and by removing obstacles to its flow at weirs.

The channels of the English Fen rivers have been enlarged and straightened, and additional straight drains have been excavated for the more effectual drainage of the low-lying Fen country. Catchwater drains have also been formed to collect the rainfall of the higher lands and convey it into the river lower down, thus gaining a better fall than could be obtained if the upland waters were allowed to flow down to the low lands, besides relieving the low lands of this additional discharge.

Straight cuts are very useful when the fall is slight and the velocity of flow is consequently small; but they are not so suitable for more rapid streams, and, besides modifying the flow, and thus tending to produce shoals below, their straight course is liable to be altered by the irregularities of the current, especially if joining a sharp bend above. The banks in such cases need protection against erosion, which adds considerably to the cost of the works. The improvement of the upper Mississippi by cut-offs has not proved satisfactory; and it has been found preferable to train the river by brushwood mattresses and dykes.

Solid weirs across a river form serious impediments to its flow; and draw-door or movable weirs should be provided with adequate waterways, and sills level with the bed of the river. Old bridges, also, with wide piers and narrow arches retard the discharge of a river, and their rebuilding with wide openings would afford considerable relief. All obstacles in the river bed, such as weeds, fallen trees, and refuse, should be periodically removed; and fish-traps at weirs should be discarded, as they collect floating leaves and rubbish in their meshes and thus soon become entirely blocked up.

(2) *Embankment of Channel.*—When it is essential that the lands bordering a river should be absolutely protected from inundation, the enlargement of a river bed to an adequate extent for discharging the greatest floods would be too costly, especially when the fall is small; and it becomes necessary to resort to the expedient of increasing the channel, above the surface of the ground, by forming embankments along each side. By making the banks with material excavated from the channel, the earthwork serves the double purpose of enlarging the river bed and forming a bank. A flood channel of considerable dimensions can be readily obtained by placing the embankments some distance back from the margin of the river, thus greatly enlarging the section when the waters rise above the level of the land, whilst leaving the natural river bed unaltered for the ordinary flow. In some cases merely low embankments are constructed, which retain small floods but are submerged when large floods come down. Embankments, however, formed to secure the surrounding country from inundation must be high enough to exceed the highest flood level of the river, strong enough to resist the pressure of the water at that level, and perfectly watertight. If water can percolate through the bank, a breach is readily formed; and if a high bank is overtopped by the river, the rush of the stream over it soon destroys a portion of the embankment and produces a disastrous inundation from the large volume of water suddenly liberated. The Fens of Lincolnshire, a large portion of Holland, the valley of the Po, and large tracts of low-lying land bordering the Mississippi are protected by embankments.

The defects in the system of embanking rivers are—that weak points in the banks are liable to be breached; that the banks are liable to be overtopped by unusually high floods; and that the muddy waters of the river in flood

deposit their sediment in the bed of the river, instead of spreading it over the adjacent land, and thus gradually raise the river bed and consequently the height of the floods. The remedies for these defects are strong high banks made of the best materials, and a periodical cleansing of the river bed. Neglect of these precautions has led to serious disasters. Large tracts in the Fens have been occasionally flooded by the bursting or overtopping of badly constructed banks. Numerous breaches have occurred in the embankments of the Po, resulting in the devastation of its valley; and the flood level of the Po has been so much raised that it has been decided not to heighten the embankments for fear of occasioning still greater disasters. The gradual silting up of the river Theiss, near Szegedin, produced a rise in its flood level which led to the overtopping of the protecting embankment in 1879, and the formation of a breach; and the water thus set free destroyed a portion of Szegedin, and inundated a tract of 200 square miles. The rise of the bed of some rivers in Japan, from the deposit of silt, has been followed up by the gradual raising of the embankments; and this system has been carried out to such a degree, and the accumulated deposit is so great, that some of these embanked rivers have their beds as much as forty feet above the level of the plains over which they flow. These high embankments necessarily require constant attention; and any failure is attended with serious inundations. They serve as a warning against the extensive raising of embankments to counteract the silting up of a river.

(3) *Pumping*.—When lands are very flat and low, lying sometimes actually below the general drainage level of the district and the waterlevel of the streams, it is impossible for rivers to perform their ordinary function of draining the land by gravitation. It is necessary in such cases to create an artificial fall by pumping the drainage waters up so as to be discharged into the adjacent streams. This method has the advantage of ensuring the effectual drainage of the lands, provided adequate pumping power is supplied; but it forms an additional tax on the land, as steam has to be applied to do what is under ordinary conditions effected by nature, and the land has also to be surrounded by banks.

This system has been adopted for the drainage of the Haarlem Meer reclamation, and also for the lands reclaimed from Lake Y in the construction of the Amsterdam ship canal. The drainage of the Fens is, in several instances, supplemented by pumping; and a portion of the Witham basin has been secured against floods by this means.

The formation of large reservoirs in river valleys has been proposed for storing the surplus waters till a flood has subsided. A reservoir has indeed been formed, by constructing a high masonry dam across a narrow gorge of the Furens valley, which both supplies the town of St Étienne with water and preserves it from inundation. It is also proposed to prevent the floods of the river Chagres from interfering with the Panama Canal, by impounding its flood waters in an extensive reservoir to be formed by building a high dam across a suitable point of its valley. In these cases, however, the deep valleys with their narrow gorges are peculiarly well adapted for the formation of reservoirs having a considerable capacity, whereas most river valleys are unsuitable for reservoirs, and the construction of the long lengths of the banks that would be required would entail a very large expenditure, so that this system could only have a very restricted application.

tion of a
river.

Improvements of the Upper Portions of Rivers.—Most rivers are not suitable by nature for navigation in their non-tidal portion, or, in the case of tideless rivers, at

a considerable distance from their mouths, as the fall of their bed increases towards their source, and they generally present irregularities in depth and flow, with occasional sharp bends. Even where the depth is adequate, an irregular or rapid flow offers a great obstacle to up-stream traffic. Moreover, the fall of the waterlevel in dry seasons would often make a river too shallow for navigation. Accordingly, whilst improving the worst bends and removing shoals, it is frequently necessary to retain the water, when the flow is small, so as to maintain a sufficient depth. This is accomplished by dividing the river into a series of sections or reaches, and pounding up the water at the end of each reach by means of a dam or weir.

Formerly rivers used to be penned in by a series of Stanches. stanches near shoal places, which held up the water, and, when several boats were collected in the pool above a stanch, it was suddenly opened, and the sudden rush of water floated the boats over the shallows below. This primitive method of navigation, termed flashing, was formerly practised on the Thames and the Severn, and also on some of the rapidly flowing rivers in France, such as the Yonne. The stanches on the Severn were removed in 1842; but a few still exist across the Thames above Oxford, where the barge navigation follows a lateral canal. These stanches, consisting of beams swung across the river and supporting a series of spars and paddles, were easily removed in flood time or for the passage of boats. The stanches on the Yonne, which were more recently erected, were of a more elaborate description, known as needle weirs, and are still retained as weirs for holding up the water, though the process of flashing has been discontinued.

As the demands of navigation increased, these primitive methods proved inadequate, and, moreover, they were quite unsuited for up-stream traffic. Accordingly weirs were substituted for stanches, to hold up the water in each reach; and locks were constructed, in suitable side channels, for enabling vessels to be passed from one reach to the next with little loss of water, and with equal facility either up or down. Rivers have been thus converted into still-water navigations, with level reaches forming a series of steps, having a fall at each lock, in place of the natural inclination of the river bed; so that the up-river traffic is in a great measure relieved from the serious hindrance of an opposing current. In order that the water held back by the weir may be retained within the channel, it is necessary to raise the banks on each side for some distance above the weir; and, as the gradual rise in the river bed towards the upper end of the reach reduces the depth, it is necessary to deepen the river along the upper portion of the reach to secure a uniform draught of water. A river is thus practically converted into a canal, with this sole difference that it has still to discharge the drainage waters of its basin. This primary object of rivers, to which indeed they owe their existence, was in many instances somewhat overlooked when rivers were utilized for navigation; and weirs appear to have been often regarded merely as dams for retaining the water, rather than as regulators of its flow.

Weirs.—Locks have been already considered in the article on CANALS (*q.v.*); so that it will suffice here to describe briefly the different forms of weirs, which are essentially river works.

Weirs have been divided into three classes, namely, overfall weirs, draw-door weirs, and movable weirs.¹

Overfall Weirs.—An overfall weir is a solid barrier placed across a stream for the purpose of raising the waterlevel (Plate V. fig. 1²), and only affords an outlet for the discharge of the river when the water rises above its crest. The waterlevel of the river is thus permanently raised, not merely in dry seasons, but also in flood time,

¹ L. F. Vernon-Harcourt, *Rivers and Canals*, p. 112.

Introduc-
tion of
locks and
weirs.

and its fall is correspondingly reduced. Accordingly, the discharging capacity of a river is materially diminished by the erection of overfall weirs; and this is only partially remedied by the deepening of the channel for navigation, especially as deposit more readily accumulates in the lower part of a reach, owing to the reduction in velocity of the current by the conversion of the river into level reaches. Endeavours have been made to alleviate this defect by placing the weir in a wide place on the river, and at an angle to the cross section of the channel, thereby increasing the length of its sill, and consequently the discharge over it for any definite height of the river (fig. 2). The gain in length of an oblique weir is somewhat neutralized by the weir not being at right angles to the direction of the current; and, even if the cross section of the channel above the sill of the weir is as large as the average section of the river bed, the change in shape, and the small hydraulic radius of the section over the weir, check the discharge of the stream.

Draw-door weirs.—In order to afford a freer flow than is attainable with the best-designed overfall weir, draw-door weirs are sometimes adopted, which serve equally well to retain the water above during dry weather, and provide a large opening for the discharge of the stream in floods. Draw-door weirs consist of a row of doors, or sluice gates, sliding vertically in grooves formed at the sides of frames, piles, or piers, which are shut down when the flow is small, but are raised to admit the passage of flood waters. These weirs generally serve to supplement an ordinary overfall weir; and, whilst the overfall weir regulates the flow in dry weather, the draw-door weir provides for its more rapid discharge in flood time. The relief, however, afforded by draw-door weirs depends entirely on the opening they furnish; they are rarely, if ever, made equal in section to the river channel, and their sills are usually raised some feet above the bed of the river; but, nevertheless, they are much superior to overfall weirs in respect of drainage, especially when the river has a small fall and low banks.

Teddington weir. A large oblique overfall and draw-door weir has been erected across the Thames, by Mr Leach, at the limit of its tidal flow at Teddington, having a total length of 480 feet. This weir is divided into four bays, the two side bays being overfalls, whilst the two central bays, 172½ feet and 69½ feet wide respectively, are closed by large iron draw-doors sliding in grooves at the sides of strong iron frames supporting a foot bridge from which the doors are raised. The frames rest upon piles, and on the top of a rubble mound raised about a foot above low-tide level.¹

Free rollers to draw-doors. The friction of large draw-doors against the grooves, in being lifted, is considerable when there is a head of water on one side; but this has been much reduced by Mr F. Stoney, in a large weir in Brazil, by making the doors, 20 feet in width, bear on each side against a row of free rollers suspended in the grooves.²

Movable weirs.—Although draw-door weirs afford a much freer discharge for a river than overfall weirs, the vertical frames or piers in which the doors slide offer more or less impediment to the flow. This defect is avoided by movable weirs, which, whilst equally efficient in retaining the water when raised, can be entirely lowered or removed so as to leave the channel quite open in flood-time.

There are three types of movable weirs which have been regularly adopted abroad, whilst other forms have been occasionally tried. The two types most extensively used are the frame or needle weir and the shutter weir, whereas the drum weir has been only erected on the Marne.

Frame weir. The frame weir consists of a series of movable iron frames, placed at intervals across the channel of a river end on to the current, carrying a foot bridge at the top, and supporting a wooden watertight barrier which forms the actual weir. Till recently the barrier was always composed of a series of long square wooden spars, or needles, placed close together and nearly vertical, resting against a sill at the bottom and against a horizontal bar connecting the frames near the top (fig. 3). This type of weir has, accordingly, been very commonly called a needle weir (*barrage à aiguilles*); but this term would not now include every form of the frame weir. The first needle weir was erected across the Yonne in 1834; and till 1881 all the weirs on the Seine below Paris were of this form. The needle weir is opened by lifting each needle successively from the foot bridge; one of the end frames is then disconnected from the rest by unfastening and withdrawing the connecting bars, the corresponding portion of the foot bridge is taken up, and the frame, which is hinged at the bottom, is lowered by chains on to the apron of the weir, and the whole of the frames are similarly lowered in succession, leaving the passage quite clear. The weir is closed again by a precisely reverse series of operations.

As the weight of the needle, which should be readily lifted by one man, imposes a limit to the height of the weir, the large frame weir recently erected at Port-Villez near Vernon, having a height

of 18 feet, has been closed by a sort of wooden hinged shutter which spans the interval of 3½ feet between each frame, and can be rolled up from the bottom and removed when the weir is to be opened.

A series of similar hinged shutters are designed to close double intervals between the frames, about 7 feet wide, of the frame weir in progress at Poses, the next weir above Martot weir which is at the boundary of the tidal Seine above Rouen. Poses weir has a form quite distinct from all frame weirs hitherto constructed, for its vertical frames are suspended from an overhead girder, and rest against a sill at the bottom when down, but can be raised entirely out of water into a horizontal position when the weir is open. The girders carry a foot bridge, from which the frames and hinged shutters are raised and lowered, and rest on masonry piers dividing the river into seven bays, the two navigable passes being 106½ feet and the five shallower passes 99 feet wide. The girders spanning the two navigable passes leave a clear headway of 17½ feet above the navigable high water, whilst the rest of the girders are merely placed above flood level. The fall at the weir is 13 feet. The system is costly, with its girders and piers, but it secures all the movable parts of the weir from injury in flood, and enables the weir to be worked with perfect ease and safety.

Sliding panels have been adopted for closing the frame weir across the Rhone at Mulatière, near Lyons, erected in 1882; and a comparison is being made of the relative durability of sliding panels and hinged shutters by placing the two systems side by side at Suresnes weir just below Paris.

The earliest form of *shutter weir* consisted of a gate, or shutter, Shutter turning on a horizontal axis at the bottom, supported by a prop weir. when raised against the stream, and falling flat on the apron of the weir when the prop was withdrawn. As considerable force would be required to raise such a shutter against a strong stream, a second up-stream gate is usually provided, which, rising with the stream and being retained by chains, relieves the pressure on the down-stream gate, and enables it to be readily raised and propped up. The waterlevel is then equalized on both sides of the upper gate, which is then lowered; and the lower gate forms the actual weir, which can be opened by merely releasing the prop. In India, where this form of shutter weir has been adopted on a large scale, the strain on the retaining chains was so great, when the upper shutter was raised in a strong current to shut off the river from the irrigation canals, that hydraulic brakes have been substituted, by Mr Fouracres, for controlling the motion of the up-stream shutters. A closed cylinder full of water is fixed on the apron of the weir above the upper shutter, in which a piston, attached to the upper side of the shutter, is fitted. Directly the current tends to lift the shutter, the piston is drawn against the cushion of water in the cylinder, which controls its motion. The pressure of the piston forces the water gradually out of some small orifices along the side of the cylinder, so that the piston is enabled to travel slowly along the cylinder. In its progress, however, it passes by some of the orifices, whereby the rate of efflux of the remaining water is reduced, and a greater resistance offered to the motion of the piston. Whilst therefore the shutter in rising presents a greater surface to the stream, and consequently exerts a greater pull upon the piston, the retarding force is similarly increased, and the shutter is thus gradually raised without any jar.

At Brulée Island weir, on the Yonne, the up-stream shutter has been dispensed with; and the shutter forming the weir is raised against the stream by a piston working in a hydraulic press (fig. 4), the water pressure being supplied from an accumulator which is charged by means of a turbine worked by the fall of water at the weir. The weir is closed by seven shutters, 11½ feet long and 6 feet high, which can be raised in five minutes; and the power for damming up the stream is actually obtained from the stream itself.

The form of shutter weir most commonly adopted in France is shown in fig. 5, representing a section of the largest and most recent weir of this type, erected at Port-à-l'Anglais weir on the Seine, two or three miles above Paris; and weirs on the same system have been erected across the Great Kanawha river in the United States. The shutter revolves upon a horizontal axis placed just above the centre of pressure on the down-stream side of the shutter. The axis is fastened on an iron tressel hinged to the apron of the weir; and the shutter and tressel are supported in position by a wrought-iron prop resting against a cast-iron shoe fixed on the apron. When the weir is closed, the shutter butts against a sill at the bottom, as is shown on fig. 5. The weir can be more or less opened, from the foot bridge, by means of chains fastened to the top and bottom of the shutter; and it can be completely lowered in flood time by releasing the prop from its shoe, when the prop, tressel, and shutter fall flat upon the apron, their fall being regulated by aid of the chains; the frames also supporting the foot bridge, being hinged to the apron, can be lowered as in the ordinary frame weir. The weir is raised by first reinstating the foot bridge, and then raising the shutters, with the connected tressels and props, by means of the chains. Each

¹ L. F. Vernon-Harcourt, *op. cit.*, plate iv. figs. 9 and 10.

² *Minutes of Proceedings Inst. C. E.*, vol. ix. p. 88.

shutter of the navigable pass at Port-à-l'Anglais is $3\frac{1}{2}$ feet wide, and rises $12\frac{1}{2}$ feet above the sill of the weir. Smaller shutter weirs, of a similar form, are placed on the top of overfalls to regulate the discharge, being so adjusted that the shutters dip when the water attains a certain height above them. Sometimes the regulation of the flow is effected through the large shutters by means of small shutters fixed in their upper panels, called butterfly valves, which open spontaneously when the water rises above the required height. The smaller shutters on the overfalls are entirely lowered in flood-time, like the large shutters, but, being unprovided with a foot-bridge, they are raised by aid of boats on the approach of the dry season. The earlier shutters erected across the navigable passes were similarly raised; but, though a foot bridge adds considerably to the cost of a shutter weir, it greatly facilitates its working.

The navigable passes in French rivers, which are always closed either by frame or shutter weirs, serve for the passage of vessels during floods when the locks are submerged.

With the exception of the primitive movable stanches, there is only one example of a movable weir in England. This self-acting shutter weir has been erected across the Irwell at Thostlenest near Manchester; and a section of it is given in fig. 6. The weir consists of a series of shutters turning on a central horizontal axis. When the weir is closed, each shutter is inclined at an angle of 85° to the vertical, as shown in fig. 6, and revolves to a horizontal position for opening the weir. It resembles in fact the French shutter weirs, except that the shutters and their supports are not removed from the channel, so that the waterway at Thostlenest is not so unimpeded as in the French system. The shutters are so adjusted that they open when the river rises $2\frac{1}{2}$ feet above its ordinary level; but, lest the rush of water, which would result from their sudden opening, should injure the river bed, an arrangement has been made for opening any of the shutters by means of a set of chains worked by crabs from each bank, so as to release the pent-up waters more gradually.¹ This weir, designed by Mr Wiswall, consists of fourteen shutters, each 10 feet wide above the axis and 9 feet below, and 12 feet long. The actual height of the weir above the floor is only 10 feet, owing to the inclination of the shutters, so that it presents a surface of 1400 square feet to the stream when closed, which is reduced to 293 feet when open.

Drum weir.

The *drum weir*, which has been adopted in several instances on the river Marne, consists of an upper and an under iron paddle capable of making a quarter of a revolution round a horizontal central axis. The upper paddle forms the weir, and the under one revolves in a closed recess, shaped like the quadrant of a cylinder, laid below the sill of the weir, from which the term *drum* is derived (fig. 7). The under paddle and the drum are so formed that a space is left between the upper face of the paddle and the top of the drum when the paddles are horizontal; and a similar space exists between the down-stream face of the paddle and the vertical wall of the drum when the paddles are vertical, as represented in fig. 7. These spaces serve as sluiceways by which water can be admitted into the series of drums on the upper or under side of the under paddles. The weir is closed by placing the upper sluiceway in communication with the upper pool, when the pressure of water on the upper faces of the under paddles overcomes the pressure of the stream upon the upper paddles, causing them to rise, and closing the weir against the stream. The weir is readily opened by shutting off communication between the upper pool and the upper sluiceway, and opening communication with the lower pool; the stream then depresses the upper paddles, or the action can be quickened by opening communication between the upper pool and lower sluiceway. The pressure on either side of the under paddles can be easily adjusted with the utmost precision, enabling the paddles to be placed at any angle, so that the most absolute control is obtained over the discharge at the weir. The largest example of this type of weir is at Joinville, on the Marne, only a few miles above Paris. The weir is formed by forty-two paddles, $3\frac{1}{2}$ feet high and $4\frac{1}{2}$ feet wide, which are worked with great ease by means of sluice gates on the left bank, being opened or closed in three or four minutes by one man. This type of weir has the defect of not being suited for navigable passes, owing to the depth of the foundations for the drum below the floor of the weir having to exceed the height of the actual weir.

Warnings of floods.

Movable weirs possess the great merit over other forms of weirs of offering little or no impediment to the passage of floods; and this advantage is still further enhanced by the system of warnings, organized for the Seine, the Loire, and other French rivers, whereby timely information of the approach of a flood is telegraphed to the various weir keepers, so that they may fully open the weirs before its arrival, and thus aid in facilitating its descent. By telegraphic intimation of the rise in the upper tributaries, and of the rainfall in the basin, it is possible to predict with remarkable accuracy the probable rise of the river at places lower down, and to afford valuable warning of a coming flood to the riparian proprietors.

¹ *The Engineer*, Sept. 1, 1882.

Tidal and Tideless Rivers.

Rivers may be broadly divided into two classes in respect of the lower portion of their course, for the tide is propagated up some rivers to a considerable distance from their mouth, commingling with the fresh water and producing an ebb and flow far into the interior; whilst rivers flowing into tideless seas descend with an unimpeded current to their outlet. Tidal and tideless rivers, possessing very distinct physical characteristics, necessarily present different features and require different methods of improvement, and will be therefore separately considered. Tidal rivers are the more numerous, owing to the greater extent of tidal seas. The great differences also in the tidal rise introduce numerous variations in the tidal influence on rivers, and the rise of the river bed determines the distance to which the tidal flow extends. Accordingly, tidal rivers exhibit a greater diversity in their natural condition than tideless rivers, which are only affected by the volume of their fresh-water discharge, the amount of sediment carried in suspension, and the inclination of their bed. These latter conditions affect also the state of tidal rivers, but their influence is greatly modified by the ebb and flow of a large volume of tidal waters. The effect of the tidal ebb and flow is most readily perceived in contrasting the mouths of tidal and tideless rivers. The mouths of the Mississippi, the Nile, the Danube, and the Rhone present very marked differences to the outlets of the St Lawrence, the Seine, the Thames, and the Severn. Tideless rivers divide into a number of mouths, whereas tidal rivers are confined to a single outlet; and the effect of tidal influence on this difference is still further confirmed by the instance of the Maas, which, with a very slight tidal range, exhibits a tendency to deteriorate into the dispersion of mouths of a tideless river. The value of tidal flow in maintaining a river is fully manifested by comparing the navigable condition of the Thames or of the muddy Humber with the delta of the Nile or the Rhone, though the latter rivers possess a much larger fresh-water discharge. The tidal rise also frequently allows of the access of vessels to a river whose entrance is barred at low water.

The general improvements of the upper portions of both tidal and tideless rivers may be carried out on similar principles, though on approaching their mouths they need a totally different treatment. To give a river a uniform depth, its channel and flow require regulation. Hard shoals may be permanently removed by dredging; but silty shoals, even when dredged away, will re-form unless the channel is contracted. Formerly rivers were regulated by building out jetties at intervals at right angles to the banks, especially in wide shoal places, in order to contract the channel and concentrate the stream, so as to scour a deeper central channel. These cross jetties, however, whilst effecting a deepening in front of their extremities, caused irregularities in the flow of the current in the intervals between them, thus producing differences in depth. Continuous longitudinal jetties, or training banks, though more costly, are much more efficient in regulating a river, and are now generally adopted for procuring a uniform width, and, consequently, a regular depth. Where the fall alters, a corresponding variation must be made in the section of the channel; and, in the case of tidal rivers, the section should gradually increase as it approaches the sea, so as to admit the increasing volume of sea water which enters but does not pass far up the estuary whose upper portion has been filled by the earlier flow.

Most rivers, whether tidal or tideless, are more or less impeded for navigation by a bar at their mouth. A bar is a ridge or shoal extending across the navigable channel,

Regulation of rivers.

Causes of bars.

over which there is a less depth than either above or below it. The lowering of such a bar forms one of the main objects of river improvement, as upon the depth that can be obtained over the bar depend the class of vessels that can enter the river, and, in tidal rivers, the period of time during which the entrance can be navigated. A bar may result from the action of the sea, which tends to form a continuous beach across any inlet, and would obliterate the mouths of rivers if the channels were not maintained by the ebb and flow of the tide and the fresh-water discharge; or it may be formed by the conflict of the sea and river water, which checks the current at the mouth and causes the river to deposit the sediment which it held in suspension. The bars at the mouths of the Mersey, the Liffey, and the Adour are due to the first cause; whilst the bars at the mouths of tideless rivers, such as the Mississippi, the Danube, and the Rhone, are mainly due to the second.

Improvement of Tidal Rivers.

Tidal
condi-
tions of
rivers.

Tidal rivers differ greatly in their natural characteristics, owing to the variety in the different conditions which affect them. Thus the Mersey, with an extreme tidal rise of 30 feet at its mouth, is only tidal for 46 miles, whilst the Seine, with a rise of 22 feet, is tidal for 91 miles, and the Scheldt, with a rise of only 13½ feet, is tidal up to Ghent, a distance of 105 miles. These differences are mainly due to the different falls of the riverbeds, but they are also affected by the facility of entry afforded to the flood tide, and the form of the channel up which it flows. The tidal capacity of a river depends on the rise of the tide and the configuration of the banks. The tidal flow into the Mersey amounts to 710,000,000 cubic yards at a high spring tide, whilst the flow into the Scheldt at Flushing, with less than half the tidal rise, reaches 475,000,000 cubic yards. The tidal capacity of the Seine, together with its estuary, formerly exceeded that of the Mersey, but it has been greatly reduced by the training works which have been carried out on it since 1848.

Influence
of tides.

The tidal ebb and flow passing and returning through the entrance channels of a river twice a day exercise a very important influence on its maintenance. The effect of tidal scour is manifested in the history of the harbours of Calais and Ostend,¹ which in old times possessed deep outlet channels, but were injured by reclamation, and in the deterioration of the outfalls of the Fen rivers as soon as the tidal flow was curtailed by the erection of sluices. The power of the tidal scour necessarily varies with the volume of water producing it, and therefore one of the first principles of tidal river improvement is that the tide should be admitted as far up a river as possible, and all obstructions to its flow removed. If, however, the maintenance of an estuary depended solely upon the tidal ebb and flow, the estuary would gradually silt up, for the flood tide brings in matter in suspension which it washes from the adjacent shores and sandbanks, especially during rough weather, when the waves stir up the sand and silt. The impetus of the tide running up the rising bed of an estuary is gradually checked, till at last slack water occurs, and the silt begins to deposit, which the ebb tide, enfeebled by the friction of the tidal water in its passage up and down the estuary, would of itself be unable completely to remove. The erection of any obstructions to the tidal flow, such as sluices and weirs, increases the period of slack tide, and consequently not only reduces the volume of ebb and flow but also promotes the deposit of silt, to the further detriment of the estuary. The maintenance of estuaries is secured by the aid of their fresh-

water discharge, which, being penned up during the flood tide, reinforces the ebb and preserves an equilibrium.

The fresh-water discharge of a river, depending upon the area of the basin and the available rainfall, naturally varies greatly in different rivers—being, for instance, greater in the Tyne and the Clyde than in the Mersey, though these rivers have little more than one-thirteenth of the tidal capacity of the Mersey. The Seine, with a drainage area of 30,500 square miles, nearly six times the size of the Thames basin, has a discharge of 28,000,000 cubic yards, on the average, each tide (about twenty-eight times that of the Mersey), though this volume sinks into insignificance when compared with the flow of the Danube with a basin of ten times the size, or still more of the Mississippi with a basin forty times as large. A large fresh-water discharge is of great value to the maintenance of an estuary, especially when, as in the case of the Seine, it carries little silt in suspension; whilst a small discharge in proportion to the size of an estuary, of which the Mersey is a notable instance, renders the state of the estuary very delicate, and necessitates great vigilance in maintaining its tidal capacity, to which its existence is almost wholly due.

The silt brought down by tidal rivers, instead of being carried to their mouths and there deposited, is met by the incoming tide at points varying daily with the states of the tides; and, moreover, except during slack tide, it is maintained in constant motion up and down the estuary, till at length it gets to the sea. Accordingly, though the sediment of tidal rivers is more or less deposited wherever the velocity of the current is checked, it does not tend to accumulate in one particular part, as in the case of tideless rivers, and therefore the formation of a bar at the mouth is mainly due to the drift by waves along the beach. A flood also, though more largely charged with silt, by giving additional power to the ebb, scours the channel and lowers the bar. The Humber, whose waters are densely burdened with mud which is readily deposited in still water, is nevertheless free from a bar.

The best form of estuary for a tidal river is when it enlarges gradually as it approaches the sea, thus affording an increasing capacity for the admission of the tide, and promoting a regular flow. The estuaries approximating to such a form are generally free from bars—as, for instance, the Thames, the Severn, and the Scheldt. When, however, a river expands abruptly into a wide estuary on a sandy coast, it winds through the enlarged estuary in an unstable shallow channel, owing to the reduced velocity of the ebb in expanding out, and the checking of the flood tide on reaching the head of the wide estuary. Thus the Seine, with a deep stable channel from Rouen to La Mailleraye, had formerly a shallow shifting dangerous channel from thence to the sea; the Ribble, with a good depth at Preston, has a shoal irregular channel towards its mouth; and the Dee, with a moderate channel at Chester, is almost barred to vessels, except at high tide, below Connah's Quay. These estuaries do not possess a well-defined bar, but their long shallow winding channels offer a still more serious impediment to navigation. The worst form is a very irregular estuary with abrupt expansions and contractions, of which the Mersey is a prominent example, for, in spite of its large rise of tide, it possesses a shallow, irregular, and shifting channel above Liverpool, and is encumbered by a wide bar below.

There are three obstructions to which tidal rivers are subject, namely, a bar, a shifting channel, and inadequacy of depth; and there are three general methods which may be resorted to for their improvement, namely, jetties, training walls, and dredging, in addition to the regulation of their upper portion by longitudinal jetties, or banks, as previously mentioned.

¹ L. F. Vernon-Harcourt, *Harbours and Docks*, pp. 149 and 155.

Jetties.

Jetties.—A bar being caused by the littoral drift, and by the impotence of the expanded current to scour the channel over it to the same depth as elsewhere, it is necessary either to arrest the drift or to concentrate the current across the bar. The drift, which comes from the direction of the prevalent winds, might be temporarily arrested by projecting a groyne, or jetty, from the shore on the windward side of the outlet. The material, however, carried along the coast would accumulate against the jetty, and eventually form a bar beyond, or, sweeping round the end of the jetty, deposit in the channel under its shelter. Accordingly a second jetty is added, on the opposite side of the outlet, to direct and concentrate the current over the bar, and thus increase the depth of the channel, and also to drive into deep water any material that may be carried round the windward jetty, or convey it within the influence of any littoral current farther out. The jetties are either made parallel, or slightly diverging, so as to form a sort of continuation of the banks of the river across the beach, or they are commenced far apart and made to converge towards their extremities, so as to admit a larger volume of tidal water and concentrate the flow into a narrow channel over the bar. The parallel jetty system has been adopted for the new outlet of the Maas (fig. 13), the mouth of the Adour near Bayonne (fig. 16), and the mouths of the Wear at Sunderland, the Yare at Yarmouth, and the Ouse at Newhaven; whilst the converging jetty system has been carried out at Charleston (figs. 17 and 18) and Aberdeen, and at the mouths of the Liffey, the Tyne (fig. 8), and the Tees.

Forms of jetties.

The ordinary form of jetty is a timber pier resting upon a base of rubble stone, like the jetties of the North Sea jetty harbours of Calais, Dunkirk, and Ostend, so that the solid lower portion may concentrate the ebb, whilst the open upper portion permits the passage of the littoral currents in order that a rapid advance of the foreshore may be prevented. Such structures, however, simply delay, and do not stop, the advance of the foreshore, as manifested at Newhaven and Dunkirk, where the accumulation of shingle in the one case and of sand in the other brought low-water mark out to the extremities of their western jetties. The solid northern jetties of the Wear and the Yare have naturally produced a similar advance of their northern beaches, both being exposed to a north-easterly drift.

A special form of jetty has been constructed at the mouth of the Adour to combine the advantages of open and closed jetties. These jetties consist of a row of cylindrical columns placed at intervals and carrying iron girders on the top. Grooves are formed at the sides of the columns, down which panels can be lowered from the roadway above to confine the issuing current, whilst when the panels are open the spaces between the columns admit the flood tide and the passage of the currents. Nevertheless there are indications of an advance of the foreshore; the sand passing through the spaces in the northern jetty has encroached upon the channel, and the depths are reduced beyond the end of the jetties (fig. 16).

The most important examples of training jetties, including converging jetties, have been made solid, though sometimes they have not been raised to high-water level at their outer ends, in order to provide for the freer admission of the flood tide. The converging jetties, or walls, at the mouth of the Liffey consist of mounds of rubble stone, and the outer portion of the northern jetty is only raised to half-tide level. The jetties at the mouth of the Maas (figs. 13 and 15) are formed of fascine mattresses; and the Charleston jetties (figs. 17 and 18) are similar in construction; in both these cases the outer portions have not been raised above half-tide level. The converging jetties or piers at Aberdeen, the Tyne (fig. 8), and the

Tees are in reality breakwaters,¹ though they serve the same purpose of protecting the entrance channels from the littoral drift, and promoting scour over the bar, as the less solid structures at Dublin and Charleston. The Tees breakwaters are random mounds of slag; the Aberdeen breakwaters at the mouth of the Dee are upright walls of concrete; and the Tynemouth piers are masonry and concrete-block walls upon a rubble foundation. The breakwaters afford a much better shelter for vessels and for dredging operations, but the lower fascine-work jetties at the mouth of the Maas are equally effective in directing the current.

Training Walls.—The wandering shallow channel of a river through a wide sandy estuary may be improved by training the channel, in a suitable direction, by means of training walls. These walls fix the channel and prevent the current eroding the sandbanks and thus changing its course. Moreover, by guiding the channel into a more direct line, making the ebb and flow follow the same course, and concentrating the current, the scouring capacity of the stream is increased and the channel is deepened. The flood tide ascends the trained channel more readily, and therefore is able to extend its influence farther up; whilst the ebb tide flows out of the improved and deepened channel earlier, and thus lowers the low-water line and increases the tidal capacity in the channel.

The trained channel must be gradually widened out and carried into deep water, otherwise the abrupt expansion which occurs beyond the ends of the training walls would so enfeeble the ebbing current that a shallow shifting channel would be formed only a short distance below. Training walls which stop in the middle of a wide sandy estuary, like the walls carried out on the Seine (fig. 10) and the Ribble, can be only regarded as incomplete works, which sooner or later will have to be extended if the full benefit of a trained channel is to be realized. When the channel is to follow close along one shore of the estuary, a single training wall on the outer side is sufficient; and a single wall is sometimes adequate for maintaining a channel in the middle of an estuary, when placed along the concave side of a bend.

The proper width between the training walls depends upon the fall, the tidal range, and the fresh-water discharge, and should gradually increase down stream so as to admit as much tidal water as possible with a steady flow. As the scour of the fresh-water discharge is greater with a contracted channel, the tendency is to place the training walls too close together, which, though improving the depth in the channel between the walls, reduces the volume of tidal water that can get up the channel and thus compromises the maintenance of the outlet beyond the walls. The training walls on the Seine and on the Ribble, whilst improving the trained channels, have been prejudicial to the channels beyond; and an extension of the works has been authorized on the Ribble. The widths also adopted between these walls are not compatible with an adequate widening out towards their outlet for the free admission of the flood tide, so that these estuaries will eventually be deficient in tidal capacity.

The training of a wandering channel is always beneficial to the maintenance and depth of the channel. The wanderings, however, of the channel, which are thus arrested, though very prejudicial to navigation, are advantageous in preventing the silting up of an estuary by the constant erosion and stirring up of the sandbanks which they effect in shifting their position, and which they carry by gradual stages throughout the whole of the

¹ L. F. Vernon Harcourt, *Harbours and Docks*, pp. 200, 317, 341.

estuary. The scouring current predominates at one time in one part and at another time elsewhere, so that slack water is never permanent in any part of the estuary, and accretion cannot progress for a long period without disturbance. When, however, a channel is permanently fixed by training walls, the condition of the estuary is completely transformed. The flood tide, indeed, comes in with its burden of silt as before, rising sooner up the improved channel, and therefore dispersing with a somewhat gentler flow over the rest of the estuary. The ebb tide, however, is mainly concentrated along the trained channel, especially when it attains its maximum scouring efficiency towards low water. Accordingly, whilst the flow in the trained channel is increased, stagnation occurs more or less over the rest of the estuary, and silting-up inevitably occurs, resulting eventually in a large reduction of tidal capacity. The accretion, moreover, is not confined to the portion of the estuary behind the training walls, but gradually creeps down, on each side of the estuary, for a considerable distance beyond the ends of the walls. Low training walls hardly rising above the adjacent sandbanks have been tried with the object of preventing this accretion, but the improved flow in the trained channel and the reduced velocity elsewhere still promote accretion behind the low walls, and the deposit, rising first along the shores of the estuary, gradually attains high-water level over a great portion of the area at the back of the training walls, and from thence slopes down to the top of the walls on each side of the channel. Though the process of accretion is less rapid with low training walls, the ultimate result is only delayed and not prevented, as clearly manifested by observations on the Seine and other rivers, so that the view formerly entertained by some engineers, that if training walls were kept down to the level of the existing sandbanks no accretion would take place, has been proved to be erroneous by the results of experience; and it may be accepted as a general law that training walls, whether high or low, inevitably lead to accretion if the flood tide is charged with silt.

Remarks
on training
walls.

The most careful consideration should be given to all the conditions of an estuary before training works are commenced, for when once begun they must be eventually carried out to deep water; and, if ports exist along the shores of the estuary, they are liable to be injured by the accretion resulting from the works unless the trained channel can be led close along them. The training works of the Seine estuary, though very advantageous to the inland port of Rouen, are compromising the approach channels to Honfleur and Havre, and have silted up the port of Harfleur, so that the extension of the training walls to Honfleur has been urged in the interests of that port, whilst large works have been executed to preserve its entrance, and a new direct channel into the sea is being proposed for Havre. Though the training works on the Dee have not been carried out hitherto in a judicious direction, having been formed mainly with a view to land reclamation, it would be advantageous for the ports of Chester and Connah's Quay to extend these works towards the sea, as there are no ports below the present limits of the training walls to be injured by the effects of their prolongation, and the navigable channel would be much improved, provided the works were carried out to deep water. The training walls in the Ribble estuary must eventually be extended, even beyond the limits at present authorized, if a good navigable channel is to be secured to Preston, but these works will produce an entire transformation in the estuary, of which large portions have been already reclaimed as a consequence of the works already accomplished. The Mersey estuary would need a very comprehensive scheme for its improvement, owing to

the very defective natural condition of the estuary, and the situation of the ports along its banks. The mere training of the channel in the upper estuary, for the benefit of the up-river ports, would result in the reclamation of the wide estuary between Runcorn and Liverpool, and thus deprive the channels between Liverpool and the sea of their natural scouring reservoir of tidal water; whilst the training of a channel below Liverpool out to the bar would necessitate very extensive works in deep water and in an exposed situation.

Dredging.—The improvements effected within recent Dredging years in the ordinary dredging machinery, and the introduction of the sand-pump dredger, have facilitated and cheapened dredging operations to such an extent that some of the most remarkable river improvements have been effected by dredging. The great increase in depth realized on the Tyne and the Clyde has been effected by means of steam bucket-dredgers aided by hopper barges, whilst the maintenance of the entrance channel to St Nazaire on the Loire, and the deepening of the approaches to Dunkirk and Calais, have been accomplished by sand pumps, which have the advantage of being able to work when exposed to moderate waves. Dredging merely consists in removing material from the river bed and thus enlarging and deepening it; and the extent to which this method of improvement may be carried simply depends upon the economical consideration as to how far the improvement of the traffic on the river by an increase of depth will afford an adequate return for the outlay. Dredging, however, furnishes a cheap method of excavation owing to the small cost of carriage by water. Dredging, being a purely artificial means of improvement, generally necessitates regular maintenance; whereas the improvement from scour effected by jetties and training walls is permanent, being realized by natural means. Frequently, however, training walls and jetties are supplemented by dredging, for the walls and jetties render the deepening by dredging easier and more permanent; whilst, on the other hand, dredging enables a greater depth to be attained, and even maintained, than could have been effected by scour alone.

The improvements on the Tyne and on the Clyde have mainly resulted from very extensive dredging operations, but they have been aided by training walls on the Clyde, and by the Tynemouth piers on the Tyne, which protect the entrance channel from drift and the dredgers from waves, and concentrate the scour over the bar. The three methods of improvement described above have been resorted to on the Tees: for training walls have been formed through the wide estuary below Middlesborough for fixing the channel; converging jetties are being constructed for sheltering the channel from wave-borne sand, and for directing the scour over the bar; and dredging is being employed for deepening the trained and sheltered channel. On the Maas also, and at Charleston, dredging is being used for attaining a depth for navigation which the jetties alone were unable to produce.

River Tyne Improvement Works.

The Tyne has a drainage area of 1053 square miles; its tidal Plate V. flow extends 18 miles from its mouth, and the range of spring tides at its outlet is 14½ feet. Being by nature a small winding irregular river, with little tidal capacity and no estuary, its depth was small and variable, and a bar existed at its mouth, which opens directly on to the sea-coast. The first improvement works, commenced in 1843, consisted in training the river by cross jetties, subsequently connected by low training walls, so as to regulate the width and consequently the depth of the river. As, however, the volume of water in the river was small, the scour was not adequate to effect a great improvement in the depth; the bed of the river between Newcastle and the sea, in 1860, was in many places above low-water level; and the depth on the bar at low tide was only 6 feet (fig. 9). The piers at the mouth were commenced in 1856,

for the purpose of facilitating the removal of the bar and for sheltering vessels entering the river, and were originally designed to terminate in a depth of 13 feet at low water; but eventually a larger scheme was adopted for forming a refuge harbour in combination with the improvement of the river, and the piers, which are still in progress, are to extend into a depth of 30 feet. In 1861 extensive dredging operations were commenced for improving the depth of the river, and a maximum of 3,515,000 cubic yards was removed in 1866; the work has been regularly continued, and the total amount dredged since the commencement, in 1838, reached 49,668,000 cubic yards in 1884, being an average of nearly 2,000,000 cubic yards annually since 1861, when systematic dredging operations were begun. The improvement in depth that was effected between 1860 and 1884 is shown on the longitudinal section of the river (fig. 9); and the deepening of the river between Newcastle and Hedwin Streams, a distance of 8½ miles, is in progress, being carried on by six dredgers. The river has also been regulated by making a straight cut across Lemington Point, and widening the channel from 150 feet to 400 feet opposite Blaydon; the obstruction offered to the Tyne by the old Newcastle Bridge has been removed by rebuilding the bridge with larger openings; and a sharp bend in the river has been eased by removing the high projecting rock at Bill Point (fig. 8). The tidal capacity of the river has been increased by 14,000,000 cubic yards; the bar has been lowered 14 feet since 1860; and the least depth at low water up to Newcastle is 20 feet, and 18 feet for 3 miles above. The deepening of the channel has produced a very beneficial lowering of the flood line in the river, thereby preserving the adjacent lands from inundation.¹ The improvement of the river has led to a great increase in the tonnage of the vessels frequenting it, and a large development of its trade. The average tonnage of the vessels, which was 163 tons in 1863, had risen to 396 tons in 1883; and the total tonnage of the vessels entering and clearing the Tyne ports rose from 4,382,000 tons in 1863 to 13,043,000 tons in 1883.

River Clyde Improvement Works.

The Clyde is a small river, with a drainage area of only 945 square miles, and a tidal flow of about 20 miles; it opens, however, into a deep well-sheltered estuary, or arm of the sea, called the Firth of Clyde, and is free from a bar. The rise of spring tides at its mouth is about 10 feet. The Clyde was by nature an insignificant stream, with numerous hard gravel shoals, and a ford 12 miles below Glasgow which could be crossed on foot. The regulation of the river by cross jetties, and the removal of hard shoals, was commenced in 1773. Early in the present century the jetties were made more uniform, others were added, and their ends were eventually connected by low training walls which were gradually raised as deposits formed behind. The river had to be subsequently widened to accommodate the increasing trade and a larger size of vessels. As scour alone could only produce a very moderate depth, systematic dredging operations were commenced in 1844, and reached a total of 28,648,000 cubic yards by the middle of 1884, the maximum accomplished in a single year (1878-79) reaching 1,502,000 cubic yards. Dredging is still being continued with six dredgers in order to maintain as well as deepen the river; for the channel up to Glasgow has been deepened so far beyond its natural limit that any matter in suspension which enters the river is readily deposited. Of the 1,041,000 cubic yards dredged in 1883-84, as much as 703,000 cubic yards consisted of deposit, or more than two-thirds of the whole quantity removed. The river has a depth of 24 feet at high water from Glasgow to Port Glasgow, and from 13 to 15 feet at low water. The tide falls 8 feet lower at Glasgow than it did before any works were begun, which not merely adds to the tidal capacity of the river, but also prevents the fresh-water floods which formerly inundated the low-lying portions of Glasgow. The improved depth has caused the average tonnage of the vessels frequenting the port of Glasgow to rise from 199 tons in 1863 to 315 tons in 1883; whilst the total tonnage entered and cleared has increased from 1,757,000 tons in 1863 to 5,544,000 tons in 1883.

River Tees Improvement Works.

The Tees was formerly a very irregular winding river between Stockton and Middlesborough, and after passing that town it opens out into a wide sandy estuary about 6 miles long and 3 miles across at its widest part. It is tidal for about 17 miles, and the rise of spring tides at its mouth is 15 feet. The improvement of the river between Stockton and the estuary was commenced in 1810 by making a straight cut near Stockton; another cut was made in 1830, and the river was also regulated by cross jetties. These works provided a more direct channel, and increased the depth by about from 2 to 5 feet. The channel, however, between the jetties was irregular in depth; and the navigable channel through the estuary was shallow and variable, with a rocky shoal across it, and a bar at the mouth of the river. Accordingly, in 1853 training walls were commenced, both for connecting the ends of the cross

jetties, and also for guiding the channel through the estuary. Dredging was commenced in 1854 for removing shoals and deepening the channel; and the ridge of rock across the estuary channel has been removed by blasting. The total amount dredged up to Oct. 31, 1884, reached 13,145,000 cubic yards, and a maximum of 1,220,000 cubic yards was dredged in 1883-84. Vessels of 8000 tons, drawing 21 feet of water, can leave Middlesborough fully laden; the average tonnage of vessels frequenting the Tees has risen from 169 tons in 1873 to 303 tons in 1883; and the total tonnage entered and cleared has increased from 1,212,000 tons in 1873 to 2,528,000 tons in 1883. It is proposed at present to deepen the channel by dredging, so as to obtain a depth at low water of 12 feet up to Middlesborough, and 10 feet from thence up to Stockton; and it is hoped that eventually 2 feet additional depth may be attained by the same means. Two breakwaters have been designed, starting from opposite sides of the estuary and converging over the bar, in order to protect the entrance, to facilitate dredging, and to keep out drifting sand. The southern breakwater has been completed, and the northern breakwater is in progress. The breakwaters and the training walls are constructed of slag obtained free of charge from the neighbouring iron-works.

Training Walls on the Tidal Seine.

The Seine has a very winding course between Rouen and the sea, Plate V. as well as in its upper portion, but it possesses a good natural figs. 10, depth between Rouen and La Mailleye, a distance of about 37 11, 12. miles. Below this point, however, the natural condition of the river was very unsatisfactory, for the channel through the estuary was constantly shifting, and high shoals existed at Aizier and Villequier with a depth over them of only 10 feet at spring tides, so that vessels of from 100 to 200 tons found the passage difficult, and even dangerous at times. Training walls, formed of mounds of chalk obtained from the neighbouring cliffs, were commenced in 1848, and were gradually extended along both sides of the channel, as shown in fig. 10, and were terminated at Berville in 1869, a further extension of the northern wall for 1½ miles having been refused in 1870 for fear of endangering Havre. These works have effected a remarkable increase in depth in the channel between the walls, as shown by a comparison of the longitudinal sections of the river in 1824 and 1875 (fig. 11); for dredging has only been used for deepening the worst shoals. The improvement, however, ceases beyond the termination of the works; and the channel between Berville and the sea is still changeable and shallow. High walls were for the most part adopted down to Tancarville on the right bank and to La Roque on the left bank. These walls, however, produced such rapid accretion behind them that low walls, raised only from 3 to 5 feet above low water of spring tides, were adopted below these points. This precaution, however, has not arrested the accretion in the estuary, which is still proceeding, though sixteen years have elapsed since the works were stopped. The accretion resulting from the training works had reduced the tidal capacity of the estuary by 274,000,000 cubic yards in 1875; and a survey in 1880 showed that a still further loss of over 40,000,000 cubic yards had occurred between 1875 and 1880. More than 28,000 acres of land have been reclaimed in the upper part of the estuary, as shown by cross lines on the plan; whilst large tracts have been raised to high-water level, as indicated by dotted lines, extending as much as 8½ miles below the ends of the training walls. The walls were originally merely rubble chalk mounds; but the bore and the currents injured the mounds, so that the walls are being strengthened by pitching or concrete on the river slope, with an apron of concrete, and piling at the toe (fig. 12). The regulation of the river, by bringing deep water about 25 miles nearer the sea, enables vessels of about 2000 tons, and drawing about 20 feet, to pass the shallow estuary between the sea and Berville at high tide and thus reach Rouen. The prolongation of the training walls has been frequently urged; but the fear of injuring Havre, and the difficulty of devising a suitable channel which would effectually serve both Honfleur and Havre on opposite sides of the estuary, have hitherto prevented the continuation of the work. The Tancarville Canal is in progress for connecting Havre with the Seine at Tancarville (fig. 10), so as to enable river craft to avoid the dangers of the lower estuary; and the canal is being made so as to be capable of being readily converted into a ship-canal if the growing accretions should impede access between Berville and the sea.

Works at the Mouth of the Maas.

The Scheur branch of the Maas, which forms the most direct Plate V. channel to Rotterdam, gradually silted up at its outlet, so that figs. 18, vessels had to seek more southern and circuitous channels. The 14, 15. length of the deepest channel was shortened in 1829 by the construction of the Voorne Canal, but even this course became inadequate for the increasing draught of vessels. Accordingly, in 1862 works were commenced for providing a new direct outlet for the Scheur branch of the river by a straight cut across the Hook of Holland, with fascine-work jetties for training and maintaining

¹ P. J. Messent, C.E., *River Tyne Improvement*, 1882.

the channel across the sandy beach into deep water (fig. 13). The cut, three miles long, was only partially excavated, its completion being effected by damming up the old channel and directing the fresh-water discharge and tidal current through the new cut. The scour soon deepened the narrow cut; but some of the sand washed from the cut settled in the wider channel formed by the jetties. The cut also, being scoured deeper than the adjacent channel above and below, was not adequately widened, and consequently impedes the entry of the flood tide up the river (figs. 13 and 14). The desired depth of 23 feet at high water not having been attained as anticipated from the works, dredging has been resorted to for deepening the outlet; and the widening out of the cut to the proper full width would improve the tidal influx. The jetties consist of fascine mattresses secured by piles and stakes and weighted with stone (fig. 15); and their outer portions have been kept down to half-tide level to promote the freer admission of the flood tide, whilst serving equally to concentrate the latter part of the ebb.

Charleston Jetties.

Plate V. The largest jetty works in the world for lowering a bar in front of a tidal estuary are being constructed at the entrance to Charleston harbour (fig. 17). The jetties are being formed after the type of the Maas jetties, with log and fascine mattresses weighted with rubble stone (fig. 18). They start from the shore about $2\frac{1}{2}$ miles apart and converge to a width of about 2000 feet over the bar, which stretches across the entrance to the harbour at $1\frac{1}{2}$ miles from the shore. The object of the works is to concentrate the tidal and fresh-water current from the land-locked estuary, having an area of 15 square miles, into which the Ashley and Cooper rivers flow, and whose mouth forms the entrance to Charleston harbour. The northern jetty, which was commenced in 1878, attained the present length of 14,860 feet in 1881; and the southern jetty had been carried out 14,130 feet towards the end of 1883. The outer portions, lying in the direction of the flood current, are to be raised; but the inner portions are to be kept low, in order to interfere as little as possible with the littoral drift and thus avoid an advance of the foreshore, and also in order to admit freely the flood tide. Though scour has already commenced, it will be necessary to aid it by dredging in order to attain a depth of 21 feet in place of the former depth of $11\frac{1}{2}$ feet.

Improvement of Tideless Rivers.

Deltas. Tideless rivers on entering the sea have their velocity checked, and consequently deposit the silt which they previously carried in suspension. In process of time this accumulated deposit forms a tract of low-lying land protruding into the sea, through which the river flows in several shallow channels to the sea owing to the impediments offered to its flow by the sediment which it deposits. The form which these diverging channels assume has led to the term delta being applied to the mouths of tideless rivers and the tract of land which they create (figs. 19 and 22). These deltas are always advancing, and consequently reducing the very small fall of the channels through them by prolonging their course. The rate of advance varies with the amount of sediment brought down, the depth of the sea in front, and the extent to which the delta spreads out. The Rhone delta has at present a yearly average progression of 140 feet; the Kilian mouths of the Danube delta have been estimated to advance 200 feet annually; whilst the Mississippi delta, extending 220 miles into the Gulf of Mexico, is supposed to have taken four thousand four hundred years in forming, which would be equivalent to an average annual advance of 264 feet, the present advance being about 207 feet in a year.

Jetties. The only method of improving the outlet of a tideless river is to concentrate the current flowing through one of the channels, and to prolong the banks of the regulated channel into deep water by means of parallel jetties.

Lateral canal. The only other way of remedying the impediments to navigation at the mouths of tideless rivers is by avoiding the delta channels altogether, and constructing a canal connecting the deep river above the delta with the sea at some suitable place beyond the influence of the river alluvium. This expedient has been resorted to for the trade of the Rhone; for, though the discharge of the river was concentrated into a single outlet by forming embankments on each side, between 1852 and 1857, which shut

off the other three outlets and extended into the sea at its mouth, the increased discharge brought down the whole sediment of the river, and a bar formed again farther out. Accordingly the St Louis Canal was formed, between 1863 and 1873, going from the head of the delta into the Bay of Foz beyond the limits of the delta. A similar plan was proposed for the Mississippi, but was abandoned in favour of the jetty system. The canal constructed by the emperor Claudius for connecting the Tiber with the harbour of Ostia proved a failure, as its outlet at Ostia was not sufficiently removed from the delta, so that it gradually silted up and is now 2 miles from the coast.

The success of the jetty system depends upon the existence of a littoral current to carry away the sediment in the stream conveyed by aid of the jetties into deep water, or upon the gradual prolongation of the jetties to keep pace with the progression of the delta. The outlets of the Danube and the Mississippi have both been improved by training one of their minor delta channels into deep water; and hitherto the depth over the bars has been maintained. In the case of the Danube, the southerly current sweeping across the outlet carries away a portion of the issuing sediment. The Mississippi jetties direct the discharge into such deep water, and with so much velocity, that it may be premature to decide to what extent the maintenance of the depth may be due to a westerly current in the gulf; but hitherto from one cause or the other, or probably from both combined, the bar has not formed again in front of the jetties.

Sulina Piers of the Danube Delta.

The delta of the Danube commences about 45 miles from the Black Sea, and has an area of 1000 square miles. The river divides into three main branches; the northern or Kilian branch conveys more than three-fifths of the discharge, but it forms an independent delta near its outlet and is consequently unsuitable for improvement (fig. 19). The southern or St George branch is the next largest, and possesses the best channel, but it divides near its outlet into two channels, which are both barred. The central or Sulina branch, though narrower and less good than the St George branch, and conveying less than one-thirteenth of the total discharge, possessed the only navigable outlet in 1858, and was therefore selected for the provisional improvement works begun in that year. The works designed by Sir Charles Hartley consist of piers, starting on each side of the Sulina outlet, which converge till the width between them is 600 feet, and are then carried parallel across the bar (fig. 20). The piers were at first constructed of rubble mounds with piles carrying a platform strengthened at intervals by timber cribs; but subsequently they were consolidated with concrete blocks (fig. 21). These piers serve to concentrate the discharge across the bar, and increased the least depth at the outlet from 9 feet in 1857 to 20 feet in 1872, a year after the final completion of the works; and this depth has been since maintained. The sediment-bearing current, moreover, is carried within the influence of the southern littoral current, which, diverting a portion of the deposit, has reduced the rate of advance of the Sulina delta from 94 feet to 44 feet in a year. This progression, however, will eventually necessitate the extension of the piers.

The Mississippi Jetties.

Though the Gulf of Mexico is in communication with the Atlantic Ocean, it is almost tideless, for the average rise of tide in front of the Mississippi delta is only 14 inches, and there is only one tide in a day. The Mississippi, accordingly, is a tideless river, and forms a delta which has an area of 12,300 square miles, and has three main channels, or passes, leading the discharge of the river into the gulf (fig. 22). The general features of the delta have been already described, and the various schemes for improving the outlet referred to (see MISSISSIPPI). In flood time the river brings down in suspension 2800 cubic feet of solid matter per second; and before the jetties were commenced the annual advance of the bars at the mouths of the passes was 300 feet at the South-West Pass, 260 feet at Pass à l'Outre, and 110 feet at the South Pass.

In 1874 Mr Eads offered to make and maintain a channel 28 feet deep across the bar of the South-West Pass, which had only 13 feet of water over it. The South Pass is narrower, having a width of from 600 to 800 feet; it conveys only about a tenth of the total discharge of the river; it was impeded by a shoal at the head of the pass with a depth of only 15 feet over it; and the depth on the bar at its mouth, where it expanded to 2 miles in width, was only 8

feet. The South Pass, however, was selected by Congress for improvement, partly on account of the smaller cost of the works required, and partly because it was the pass which had been preferred by a previous commission. The depth of the South Pass through the delta, a distance of about 13 miles, was 30 feet; so that the obstructions to be removed were restricted to the head and mouth of the pass. Dredging had been tried for deepening the outlet of the South-West Pass, and had necessarily failed in producing any permanent improvement, for sediment soon filled up again the portion of the channel which had been enlarged beyond its natural limits of maintenance. The object aimed at in the South Pass was to contract the width of the channel at the head and outlet, so that the current might be forced to regain its required section of channel by scouring out in depth what it lost in width. At the mouth of the South Pass this result could be effected by concentrating the current over the bar with parallel jetties, thus prolonging the banks of the pass artificially into deep water, and contracting the current sufficiently to ensure the requisite depth. At the head, however, of the South Pass, the conditions were more complicated; for, as soon as the entrance channel there was contracted, a portion of the discharge tended to desert the impeded pass for the other more open passes, and the head works by themselves would therefore have deprived the South Pass of a portion of its natural flow, which would have necessarily led to a reduction of the channel below the head. Accordingly the entrances to the other passes had to be correspondingly reduced, so as not to absorb more than their former proportion of the discharge and thus leave the discharge through the South Pass undiminished.

The works consist mainly of willow mattresses, which are specially suitable where osiers are abundant, and where settlement on the soft alluvial bottom is inevitable. The funnel-shaped entrance at the head of the South Pass was contracted across the shoal into a uniform channel, 800 feet wide, by means of mattress dykes; and mattress sills, 30 to 40 feet wide, 60 to 70 feet long, and 2 feet thick, were laid right across the entrances to the other two passes to restrict the volume of their discharge to its normal amount.

The parallel jetties on each side of the mouth of the South Pass consist of tiers of willow mattresses, 100 feet long, from 20 to 50 feet wide, and about 2 feet thick, consolidated with rubble stone, and capped at the outer ends with concrete blocks to secure them against waves (fig. 23). They have been raised to flood-tide level to within 1000 feet of their extremities. The east jetty is $2\frac{1}{2}$ miles long, and the west jetty $1\frac{1}{2}$ miles; they terminate at the same distance out, in a depth of thirty feet. They are placed about 1000 feet apart, and are curved slightly towards their extremities, so as to bring the channel at right angles to the westerly littoral current in the gulf. The jetty channel has been contracted to a width of 700 feet by mattress spurs, in order to promote the scour in the central channel, which was lessened at first by leakage through the mattresses owing to their want of consolidation from difficulties in the supply of stone.

The works were commenced in 1875, and completed in 1879. The channel was to be made, according to the terms of the contract, 26 feet deep and 200 feet wide, with a central depth of 30 feet. According to a survey made in May 1884, the least central depth through the jetty channel is 33 feet, and the width of the 26-foot channel is 290 feet; and beyond the jetties the least central depth is 31.8 feet, and the least width of the 30-foot channel is 70 feet. At the head of the South Pass there now exists a straight channel with a minimum central depth of 35 feet; and the 30-foot channel has a minimum width of 275 feet. There is now a depth of 30 feet right through the South Pass.

The latest surveys indicate only a slight shoaling beyond the outlet, showing that hitherto the accelerated current, being protruded into deep water and aided by the littoral current, has not created a fresh bar by the deposit of its sediment. As the littoral current cannot be expected to convey away more than a portion of the sediment brought down, the material must be accumulating beyond the outlet, and after having filled up the deep places in front, will gradually rise beyond the ends of the jetties, where the dispersed river current will be unable to carry it away. This shoaling, however, may be delayed for a considerable time by the distance to which the velocity of the trained current carries the sediment, and the depth in which the sediment is deposited; and when it becomes prejudicial to navigation, it can be readily removed by an extension of the jetties.

Conclud- The method of lowering a bar at the mouths of rivers
ing re- by means of jetties has been applied, as indicated above,
marks. to both tidal and tideless rivers; but the systems employed
for each type of river are based on different principles
which must not be confounded together. A tideless river
is maintained solely by its discharge, and therefore the
more its channel is contracted the greater is the depth

attained. As, however, a tidal river depends largely for its maintenance on its tidal flow, a contraction at its mouth checks the entrance of the flood tide and reduces the tidal flow. The contracted width between the Adour jetties (fig. 16) has reduced the tidal rise at Bayonne in spite of the openings formed in them for the admission of the tide; and the narrow width of the cut at the Maas outlet (figs. 13 and 14), whilst affording an improved depth in the cut, is prejudicial to the depth elsewhere. A parallel channel with high jetties is suitable for tideless river mouths; but a slightly diverging channel, with the outer ends of the jetties below high-water level, is expedient for tidal rivers. Converging jetties, like those of Dublin and Charleston (fig. 17), would be perfectly useless at tideless outlets; but these jetties, by not being unduly contracted at their extremities, and by being kept low towards their ends, freely admit the tidal flow, whilst the increased capacity obtained by their enlarged form increases the tidal scour at the outlet. The comparatively small improvement in depth over Charleston bar, as compared with the magnitude of the works, may be due to the want of concentration of tidal scour, owing to the small elevation of the inner portions of the jetties, which allows of the dispersion of part of the ebb.

The greatest difficulty in training tidal rivers is so to adjust the width of channel that the free admission of the flood tide may be secured whilst affording adequate scouring power for the current. If the influx of the tide is checked by a sufficient reduction of width to ensure improvement in depth by scour, the capacity of the estuary is eventually reduced, and a portion of the scouring power is lost, as in the case of the Seine. It is better, therefore, to regulate the width so as to ensure a free admission of the tide, and to provide for any deficiency in scour and depth by dredging. Deepening by dredging can be easily and economically effected to any desired extent, as shown by the Tyne and Clyde improvements; whereas tidal capacity in an estuary, when once lost, can never be regained.

Messent; "The River Clyde," by James Deas, *Proc. Inst. C. E.*, vol. xxxvi.; "The Delta of the Danube," by Sir Charles Hartley, *Proc. Inst. C. E.*, vols. xxi. and xxxvi.; *A History of the Jetties at the Mouth of the Mississippi River*, by E. L. Corthell. (L. F. V.-H.)

RIVIERA OF GENOA. See ITALY, vol. xiii. p. 437. It is customary to speak of the Eastern and Western Riviera (Riviera di Levante and Riviera di Ponente), which meet at Genoa.

RIXDORF, a large village to the south-east of Berlin, and practically an outlying suburb of that city, with which it is connected by tramway, is chiefly interesting as a foundation of Moravian Brethren from Bohemia, who settled here in 1737, under the protection of King Frederick William I. German Rixdorf, which is now united with Bohemian Rixdorf, was a much more ancient place, and appears as Richardsdorf in 1630 and as Riegenstorp in 1435. The inhabitants of the united community (who numbered 18,729 in 1880, though only 3421 in 1852) are engaged chiefly in weaving, in the manufacture of india-rubber goods, and in the various industries of the neighbouring capital.

RIZZIO, DAVID, a servant of Mary, queen of Scots, was, according to Buchanan, a native of Turin, and came to Scotland in 1561 in the train of the Piedmontese ambassador. He entered the queen's service as a musician in 1564, and was also employed by her as private foreign secretary. He was murdered in 1566, as has been related in the article MARY (vol. xv. p. 596).

RJEV. See RZHEFF.

ROACH (*Leuciscus rutilus*), a fish of the family of Carps (*Cyprinidae*) and of the genus *Leuciscus*, which comprises also the Rudd, Chub, and Dace. It is one of the most common freshwater fishes of Europe north of the Alps, and extends northwards as far as Lapland. Its pharyngeal teeth are in a single series, five or six on each side. The body is generally rather deep, its greatest depth being about one-third of the total length, the caudal fin not included. The scales are large, from forty-two to forty-four along the lateral line, seven or eight series being above it, and three between the lateral line and ventral fin. The first dorsal rays are inserted vertically above, but not in advance of the root of the ventral fin. The anal fin is supported by from twelve to fourteen rays. The general colour is silvery, in adult fishes with a red tinge about the lower fins. Roach spawn from April to May, and frequently produce hybrids with other allied fishes, such as the rudd and the bream. They never attain to a large size, a roach of 1½ lb being considered an unusually large fish. As a food-fish this species is not held in esteem; but by the pleasure it affords to a large class of humble anglers it rivals any of the freshwater fishes which give more pretentious sport, and has properly been made the subject of a special work, *The Book of the Roach*, by Greville Fennell (London, 1870).

Roman
roads.

ROADS AND STREETS. The earliest roads about which anything definite is known are those of ancient Rome, one of the oldest of which and the most celebrated for the grandeur of its works—the Appian Way—was commenced in 312 B.C. Roman roads are remarkable for preserving a straight course from point to point regardless of obstacles which might have been easily avoided. They appear to have been often laid out in a line with some prominent landmark, and their general straightness is perhaps due to convenience in setting them out. In solidity of construction they have never been excelled, and many of them still remain, often forming the foundation of a more modern road, and in some instances constituting the road surface now used. It is consequently possible, with the help of allusions of ancient writers, to follow the mode of construction. Two parallel trenches were first cut to mark the breadth of the road; loose earth was removed until a solid foundation was reached; and it was replaced by proper material consolidated by ramming, or other means were taken to form a solid foundation for the body of the road. This appears as a rule to have been composed of four layers, generally of local materials, though sometimes they were brought from considerable distances. The lowest layer consisted of two or three courses of flat stones, or, when these were not obtainable, of other stones, generally laid in mortar; the second layer was composed of rubble masonry of smaller stones, or a coarse concrete; the third of a finer concrete, on which was laid a pavement of polygonal blocks of hard stone jointed with the greatest nicety. The four layers are found to be often 3 feet or more in thickness, but the two lowest were dispensed with on rock. The paved part of a great road appears to have been about 16 feet wide, and on either side, and separated from it by raised stone causeways, were unpaved side-ways, each of half the width of the paved road. Where, as on many roads, the surface was not paved, it was made of hard concrete, or pebbles or flints set in mortar. Sometimes clay and marl were used instead of mortar, and it would seem that where inferior materials were used the road was made higher above the ground and rounder in cross section. Streets were paved with large polygonal blocks laid as above described and footways with rectangular slabs. Specimens are still to be seen in Rome and Pompeii. There are no traces of Roman influence in the later roads in England, but in France the Roman method appears to

have been followed to some extent when new roads were constructed about the beginning of the 18th century. A foundation of stones on the flat was laid, and over that two layers of considerable thickness, of larger and smaller stones, bordered by large stones on edge, which appeared on the surface of the road. In 1764 Tresaguet set the foundation-stones on edge and reduced the thickness of the upper layers, and his method was generally followed until the influence of Macadam began to be felt. A French chaussée with accotements still retains some resemblance to the old Roman roads.

The almost incredibly bad state of the roads in England towards the latter part of the 17th century appears from the accounts cited by Macaulay (*Hist.*, c. iii.). It was due chiefly to the state of the law, which compelled each parish to maintain its own roads by statute labour, but the establishment of turnpike trusts and the maintenance of roads by tolls do not appear to have effected any great improvement. At the time of Arthur Young's six months' tour in 1770 the roads would seem to have been almost as bad as ever, and it is doubtful if there was much improvement up to the beginning of the present century. The turnpike roads were generally managed by ignorant and incompetent men until Telford and Macadam brought scientific principles and regular system to their construction and repair. The name of Telford is associated with a pitched foundation, which he did not always use, but which closely resembled that which had been long in use in France, and the name of Macadam often characterizes roads on which all his precepts are disregarded. Both insisted on thorough drainage and on the use of carefully prepared materials, and adopted a uniform cross section of moderate curvature instead of the exaggerated roundness given before; but, while Telford paid particular attention to a foundation for the broken stone, Macadam disregarded it, contending that the subsoil, however bad, would carry any weight if made dry by drainage and kept dry by an impervious covering. Macadam was engaged more with the repair of old roads than with the construction of new ones, and, though it is not possible to agree with all his doctrines, the improvement which he effected in road management and maintenance was great and lasting.

Construction of Roads.—A road should be as short as possible between two points to be connected, but straightness must often be sacrificed to avoid difficulties and expense and to secure good gradients. The latter should be as easy as practicable, having regard to the country to be traversed, and it is desirable that there should be a ruling gradient than which none should be steeper. On a level macadamized road in ordinary repair the force which the horse has to put forth to draw a load may be taken as one-thirtieth of the load. But in going uphill the horse has also to lift the load, and the additional force to be put forth on this account is very nearly equal to the load drawn divided by the rate of gradient. Thus on a gradient of 1 in 30 the force spent in lifting is one-thirtieth of the load, and in ascending a horse has to exert twice the force required to draw the load on a level. In descending, on the other hand, on such a gradient, the vehicle, when once started, would just move of itself without pressing on the horse. A horse can without difficulty exert twice his usual force for a time, and can therefore ascend gradients of 1 in 30 on a macadamized surface without sensible diminution of speed, and can trot freely down them. These considerations have led to 1 in 30 being generally considered as the ruling gradient to be aimed at on first-class roads, though 1 in 40 has been advocated. Telford adopted 1 in 30 as the ruling gradient on the Holyhead road through North Wales, and there are only two gradients steeper, in places where they were unavoidable. All unnecessary rises and falls should be avoided, but a dead level is unfavourable for drainage, and on this account 1 in 100 to 1 in 150 is the flattest gradient that is desirable. Such slight rises and falls are probably rather favourable than otherwise to ease of draught by horses.

In transverse section, roads in the United Kingdom generally comprise the carriage-way, a space on each side, on one or both of which there may be a footpath, then the fences, and outside all the ditches. The width of the carriage-way may be from 15 feet, which allows of the easy passage of two vehicles, to 30 or 50 feet

for roads of importance near towns. The side spaces may be from 4 or 5 to 8 or 10 feet wide; wide sides give the sun and air access to the road, and tend to keep it dry, and also afford space for the deposit of road materials and scrapings. In cuttings or on embankments the transverse section has of course to be modified. The road surface should have just enough convexity to throw the wet off freely, and a very moderate amount is sufficient when a good surface is maintained. On a too convex road the traffic keeps to the middle, and wears ruts which retain the water, so that the surface is not so dry as with a flatter section which allows the traffic to distribute itself over the whole width. Telford used a cross section differing slightly from an arc of a circle in being more convex in the middle than at the sides. Walker recommended two straight lines joined in the middle of the road by a curve, and inclined about 1 in 24 towards the sides, the objection to which is that the flat sides are liable to wear hollow. An arc of a circle is often used, and is a good form, but on the whole a curve more convex at the centre than towards the sides is the best. The rise in the curve from the sides to the centre need not exceed one-fortieth of the width, and one-sixtieth is generally enough on well-kept roads, and if seven-eighths of the total rise are given at one-fourth the distance from the centre to the sides and five-eighths at half that distance a curve of suitable form will be obtained. It is generally best to obtain the requisite convexity by rounding the formation surface or seat of the road and giving a uniform thickness to the coating of stone. When there is not a kerb there should be a "shouldering" of sods and earth on each side to keep the road materials in place, and to form with the finished surface the water tables or side channels in which the surface drainage is collected, to be conveyed by outlets at frequent intervals to the side ditches. The outlets are open cuts through the sides or drains beneath the footpaths. The side ditches should be deep enough to thoroughly drain the foundation of the road, and cross or mitre drains under the road communicating with the side ditches may be required in wet soil. A thorough drainage of the subsoil is of the greatest importance, and it is economical in the end to go to considerable expense to secure it. In a cutting, or where there are no side ditches, the surface water may be taken off by gratings and under drains beneath the side channels.

Thick-
ness.

The thickness to be given to a road made altogether of broken stone will depend on the traffic it is intended for. On a good well-drained soil a thickness of 6 inches will make an excellent road for ordinary traffic, and Macadam's opinion that 10 inches of well-consolidated material was sufficient to carry the heaviest traffic on any substratum if properly drained has proved to be generally correct. In a new road the less of thickness during consolidation must be allowed for, and the materials should be laid about one-half thicker than the coating is intended to be. When the materials are not rolled, a thickness of 3 to 6 inches should be laid first, and when that has partly consolidated under the traffic other coats may be added to make up the full thickness. There is great wear and waste of the materials in consolidating if they are laid too thickly at once. Inferior material is sometimes used in the lower part of the road coating, especially when the surface is to be of granite or other hard expensive stone. Thus flints or gravel may be used for the lower 5 or 6 inches of a road to be coated with 3 or 4 inches of granite.

Binding.

Telford covered the broken stone of new roads with $\frac{1}{2}$ inches of gravel to act as a binding material. Macadam absolutely interdicted the use of any binding material, leaving the broken stone to work in and unite by its own angles under the traffic. An unsound road may be made by the improper use of a binding material, but there is no doubt that broken stone consolidates more quickly, and without losing its angular form, when binding is moderately used. About one half the volume of broken stone is void space, and, as the results of examinations into the composition of the coatings of roads when thoroughly consolidated prove that a very large proportion must necessarily be small stones and detritus, it is much better to give some portion of this at first rather than to obtain it by the crushing and grinding of the materials by the traffic. The binding material—fine gravel, sand, or road scrapings—should be spread over the surface after the broken stone is laid and not be mixed with it. Uniform consolidation is much aided by raking.

Rolling.

Whenever it is possible a new road should be finished with a roller. The materials are consolidated with less waste, and wear and tear of vehicles and horses is saved. Horse-rollers, if heavy enough to be efficient, require a number of horses to draw them and are cumbersome to use. A ton or a ton and a half weight per foot of width is desirable, and to obtain it a roller 4 feet wide must be loaded to 5 or 6 tons, and will require as many horses to draw it. In Great Britain horse-rollers have to a great extent been superseded by steam road rollers in consequence of the superiority and economy in the work done. A 15-ton roller, 7 feet wide, giving upwards of 2 tons weight per foot, can thoroughly consolidate 1000 to 2000 square yards of newly-laid materials per day. The materials should be formed to the proper section, and not more than 4 or 5 inches in thickness; if a greater thickness is required

it is better to roll two coats separately. After several passages of the roller any hollows must be filled up with small materials, and the rolling must be continued until it causes no motion among the stones. When this result has been attained the binding material may be added. It should be spread dry and uniformly in moderate quantities and should be rolled into the interstices with the aid of watering and sweeping. Provided that all the interstices in the upper stratum of stones are filled after the stones are thoroughly consolidated, the less binding that is used the better. By using binding in larger quantity, and before the stone is thoroughly consolidated, the amount of rolling required is lessened, but at the expense of durability in the road. Watering is necessary from the commencement of the rolling unless the weather is wet, but excessive watering, especially in the earlier stages, tends to soften the foundation.

A pitched foundation like that used by Telford is always desirable for a road that is subject to heavy traffic. It consists of flat stones carefully set on edge in courses across the road with the broadest edges downwards. The upper edges should not exceed 4 inches in breadth, to hold the broken stone well. All inequalities must be knocked off, and small stones and chips must be firmly pinned into the interstices with a hammer, so as to form a regular convex surface, with every stone firmly fixed in place. The thickness of the pitching is generally 6 or 7 inches; it should not be less than 4, and it may generally be thicker without any sensible increase of cost. At least 4 inches of broken stone are required over the pitched foundation, and, when consolidated, 6 are always sufficient. A foundation of cement concrete 6 inches thick was used by Sir J. Macneill on the Highgate Archway (London) road on a bad clay bottom, and common lime concrete was subsequently used elsewhere. A bed of lias lime concrete 12 inches thick was laid as a foundation in Southwark Street and on the Thames Embankment, but it is too expensive for a macadamized road under ordinary circumstances. Burned clay, gravel, or even sand may be usefully employed as a foundation on a clay bottom, to cut off the road material from the clay.

The qualities required in a good road stone are hardness, toughness, and ability to resist the action of the weather, and these are not always found together in the same stone. Limestones possess another quality, that of furnishing a mortar-like detritus which binds the stone together, and enables it to wear better than a harder material that does not bind. For heavy traffic the best materials are traps, basalts, greenstones, and syenite; quartzose grits and cherty sandstones are also excellent materials. For moderate traffic the harder limestones are sufficiently durable and make the smoothest and pleasantest roads. Coefficients of quality for various road materials have been obtained by the engineers of the French "Administration des Ponts et Chaussées." The quality was assumed to be in inverse proportion to the quantity consumed on a length of road with the same traffic, and measurements of traffic and wear were systematically made to arrive at correct results. These processes requiring great care and considerable time, direct experiments on resistance to crushing and to rubbing and collision have also been made on 673 samples of road materials of all kinds. The coefficients obtained by these experiments, which were found to agree fairly well with those arrived at by actual wear in the roads, are summarized in the following table. The coefficient 20 is equivalent to "excellent," 10 to "sufficiently good," and 5 to "bad."

Materials.	Coefficient of Wear.	Coefficient of Crushing.
Basalt	12.5 to 24.2	12.1 to 16
Porphyry	14.1 " 22.9	8.3 " 16.3
Gneiss	10.3 " 19	13.4 " 14.8
Granite	7.3 " 18	7.7 " 15.8
Syenite	11.6 " 12.7	12.4 " 13
Slag	14.5 " 15.3	7.2 " 11.1
Quartzite	13.8 " 30	12.3 " 21.6
Quartzose sandstone	14.3 " 26.2	9.9 " 16.6
Quartz	12.9 " 17.8	12.3 " 13.2
Silex	9.8 " 21.3	14.2 " 17.6
Chalk flints	3.5 " 16.8	17.8 " 25.5
Limestone	6.6 " 15.7	6.5 " 18.5

Stone for a new road should be evenly broken to a size that will pass every way through a ring 2½ inches in diameter. For repairs, especially when the material is tough, a gauge of 2½ or 2 inches may be used with advantage, as the stone covers a larger surface, consolidates sooner, and makes a smoother surface. Stone is best broken by hand, but stone-breaking machines have been introduced which supersede hand-breaking to some extent, especially where large quantities of hard stone are to be broken. There is always a certain amount of crushing in breaking by a machine, from which softer stones suffer more, and machine-broken stone is never nearly so cubical, uniform in size, or durable as stone well broken by hand. Broken road material contains about 55 per cent. of solid stone to 45 of void space. In a well-consolidated road the void is filled up by small fragments, detritus, and mud, the result of wear, and specimens of good road surfaces weigh from 93 to 95 per cent. of the weight of the solid stone of which they are made. In the

coating of a well-maintained road the proportion of stones of various sizes varies, but generally from one-third to one-half is found to consist of detritus under three-eighths of an inch in diameter, and there is a very constant proportion of about one-fifth of mud and detritus under one-thirtieth of an inch in diameter. This appears to be the amount necessary to fill the voids between the fragments of stone when compacted together. In an ill-kept road, from which the mud is not removed, the proportion of detritus is much higher, and mud may constitute nearly one-half of the coating. In proportion as the detritus and mud are kept down to the minimum by constant removal from the surface, so will the road be able to resist the action of wet and frost and the wear of the traffic.

Wear.

The wear of materials, resulting in their gradual reduction to detritus, is due to the joint action of the traffic and the weather, which cause surface wear, wear arising from cross breaking, and from rubbing of the stones together. When there is no movement in the body of the road, and the wear is confined to the crushing and grinding at the surface, it is the least possible; but, when a road is weak from insufficient thickness or solidity on a yielding foundation, bending and cross breaking of the coating take place under passing loads in addition to the surface wear, and the effects are aggravated by the softening action of water finding its way into the road through cracks formed in the surface and by the disintegrating action of frost. The wear and waste are thus far larger than on roads of sufficient strength, properly maintained. The destructive effect of wheels is greater as the diameter is less, and to a much greater degree as the tire is narrower. On hard and strong roads no greater width of wheel than 4½ inches is useful, as a wider tire does not bear evenly, but on yielding roads a greater width is of some advantage, though it does not prevent damage from bending and cross breaking of the whole coating under excessive loads. A good deal of attention has been given by French engineers to the measurement of traffic, wear, and the consumption of road materials. Without a knowledge of the amount of traffic accurate comparisons of wear are impossible, and an account of the traffic on the roads of France is taken periodically in "collars" or horses drawing loads, and in the weight drawn. Traffic as measured by weight drawn has of late been observed in some of the streets of London and Liverpool, and has been reduced for comparison to the weight per foot or yard of width of the carriage-way. Wear may be measured by loss of thickness in the coating; but the loss of stone in proportion to detritus must also be ascertained before all the effects of wear can be determined. The accurate measurement of wear as practised by the French engineers is a complicated process, and it must suffice here to state that measured by thickness the wear is seldom found to exceed half an inch, or on the most frequented roads of France one inch, of consolidated surface per year, and that about 100 cubic yards of good materials per mile per year are considered as the average consumption under 100 collars of traffic per day. Observations in the United Kingdom on roads well and systematically maintained have confirmed these results.

Maintenance.

The new materials may be added to the road either in thin coats and small patches year by year or in a thick coat consolidated by rolling. The first method, by which the wear is replaced annually and the traffic is depended on to work the materials into the road, can be followed with excellent results, and at no great inconvenience to the public under proper management when the traffic is not excessive. Considerable care in the use of materials is required that none may be unnecessarily applied. The annual employment of one-fifth or one-sixth the quantity which it would take to cover the whole surface one stone in thickness is often sufficient to replace wear, and it will then take five or six years to coat every part of the road if it is covered regularly. It is therefore important to apply the new materials only where they are needed, and not to use them where the road is already sufficiently thick. The irregularity of wear and of thickness enables a good roadman to judge where new materials must be applied, and he will apply them in small quantities wherever weak places appear. To facilitate this the materials should be placed in heaps by the roadside in the summer, and they should be carefully spread in the autumn and attended to afterwards to ensure consolidation without waste. By good management a large quantity of materials may be incorporated in a road before the middle of the winter without harassing the traffic, and the strength may not only be maintained but increased. On a hard strong road consolidation may be aided by loosening the surface with a pick; generally only the margin of a patch need be picked up. But if the road is soft or weak it is better not to disturb the surface at all. Binding may sometimes be used to aid consolidation, but it is seldom necessary if the materials are properly laid and attended to, as the coating already contains detritus enough. In the second method a coating of materials is laid on at once sufficient to endure the wear of several years with such slight repairs as may be necessary to keep a good surface, and, when the wear has gone as far as it can be safely allowed to go, the process is repeated. Unless the wear is very considerable there is no economy in this method, though the convenience to the public, especially in towns, is undeniable. Consolidation by rolling (after the manner

already described) is essential, and it is generally desirable to loosen the old surface to ensure the incorporation of the new coating with it. Scraping and attention are required between one coating and another and also slight repairs to the surface, as, however well the materials may be laid and rolled, the wear of the ordinary traffic will search out places which have escaped the full pressure of the roller and produce inequalities.

Besides a regular application of new materials to replace wear, there must be in road maintenance on proper principles a systematic removal of the detritus by scraping or sweeping, which must be regarded as keeping the whole coating in proper condition, and not as mere surface cleansing. The wear should also be reduced as far as possible by providing sufficient thickness to carry the traffic, by keeping an even surface on which water can never stand and soak, and by good drainage both of surface and subsoil. An adequate amount of skilled manual labour is necessary for economy of maintenance, and this and the constant attention which is required to keep a road in good order are best secured by putting a man in permanent charge of a defined length. In the autumn and winter, when more labour is wanted, extra men should work under the directions of the permanent road labourer, whose knowledge of his length of road will enable him to employ them to the best advantage.

Concrete macadam, formed by grouting with lime or cement Concrete mortar a coat of broken stone laid over a bed of stone previously and tar well rolled, has been tried as an improvement on an ordinary macadamized surface, but not hitherto with much success. When adam. cleanliness is of importance, and great durability is not required, tar macadam or bituminous concrete may be usefully employed. It is sometimes made by first spreading a coating of broken stone and consolidating it by a roller, and then pouring over it a mixture of coal-tar, pitch, and creosote oil, upon which a layer of smaller stone is spread and rolled in, and the surface finished with stone chippings rolled in. More usually the broken stone and bituminous mixture are well incorporated together before they are spread, the stone sometimes being previously heated. The lower layer, about 4 inches thick, may be of stone broken to 2½ inches gauge, and the next layer, about 2 inches thick, may be of smaller stone. Each layer must be well rolled, and when perfectly solid a thin coating of fine stone or granite chippings is spread over the surface and rolled in. Hard limestone is found to be more suitable than silicious or igneous rocks for this material. A road surface well made in this manner will last several years under light traffic without any repairs, and it can easily be patched when necessary.

Stone Pavements.—Early pitched roadways consisted of pebbles STONE or rounded boulders, bedded in the natural surface or in sand or PAVE-gravel. The next step in advance was to employ roughly-squared MENTS. blocks; but the wide and irregular joints admitted the water to the subsoil, and the mud worked up and the stones sank irregularly under the traffic. Telford, who was called upon to report on the street pavements of the parish of Hanover Square in 1824, saw the necessity of cutting off all connexion between the subsoil and the paving stones. He recommended a bed of about 6 inches of Founda-clean river ballast, rendered compact by being travelled upon for tion. some time before the paving was laid, but he subsequently considered that nothing short of 12 inches of broken stone, put on in layers 4 inches thick and completely consolidated by carriages passing over them, would answer the purpose. He recommended paving stones of considerable depth and of from 4½ to 6 or 7½ inches in breadth for the greatest thoroughfares, and he pointed out the importance of working the stones flat on the face and square on all sides, so as to joint close and preserve the bed or base as nearly as possible of the same size as the face, and of carefully placing together in the same course stones of equal breadth. Many pavements thus laid with stones of considerable breadth still remain, but experience proved that it was a mistake to suppose that broad stones having a larger base would support better the weight and shocks of heavy traffic; on the contrary, a wide stone has a tendency to rock on its bed, and also to wear round on the top and become slippery. To obtain an even surface and a better foothold for the horses the stones were reduced in width, and in 1840 a granite pavement was laid by Walker on Blackfriars Bridge, which may be considered the first of modern set pavements. The stones were 3 inches broad and 9 deep; they were laid on a bed of concrete 1 foot thick and were jointed with mortar. The reduction of breadth to about 3 inches was generally followed, but it is only of late years that a concrete foundation has been employed to any great extent, the frequent breaking up to which streets are subject having prevented it. In London a foundation of broken stone has been continued in the chief thoroughfares, the sets being evenly bedded in gravel upon it and rammed with a heavy wooden rammer. Hard core—a mixture of broken stone, clinker, brick rubbish, and old building materials—has also been largely used to form a foundation. In the northern towns of England cinders have been employed, and where the traffic is exceptionally heavy a pitched foundation of stones on edge has been laid when the sets were not paved upon an old macadamized surface. The concrete for a foundation to a paved street should be made with the

best Portland cement, thoroughly mixed in proper proportions with the sand and gravel or other materials used, water being added as sparingly as possible. A thickness of 6 inches of well-made cement concrete is sufficient for the heaviest traffic, and it can be cut out in slabs for pipe-laying or repairs and can be relaid and cemented in its place. To obtain the best result a new foundation should not be paved upon for a week. A foundation of bituminous concrete is sometimes used where only a thin bed can be laid, in consequence of there being an old foundation which it is undesirable to disturb. It is made by pouring a composition of coal-tar, pitch, and creasote oil while hot over broken stone levelled and rolled to the proper form, and then spreading a thin layer of smaller broken stone over the surface and rolling it in. It has the advantage that it can be paved upon a few hours after it has been laid.

Materials. The best materials for pavement sets are the hard igneous and metamorphic rocks, though millstone grit and other hard sedimentary rocks of the same nature are used when the traffic is comparatively light. Excessively hard stone which wears smooth and slippery is objectionable in spite of its durability. Penmaen-Mawr stone, which is much used in many of the large Lancashire towns, is of this character, and its use was discontinued in London in consequence of its slipperiness and noise. Guernsey granite (syenite) and Mount Sorrel granite (syenite) have the same nature in a less degree, and in London Aberdeen blue granite is preferred, as, though it wears faster, it keeps a rough surface. Walker's observations on the wear of tram stones showed that Aberdeen granite wore three and a quarter times as fast as Guernsey granite, and in the set pavement of Blackfriars Bridge it was found that after thirteen and a half years' wear the Aberdeen stone had worn $1\frac{1}{2}$ inches, while the Guernsey granite had only worn one-fourth of an inch (equal to .11 and .019 inch per year respectively), or that the former had worn six times as fast as the latter. Observations made by Mr Haywood showed the general rate of wear of Aberdeen granite under heavy traffic in the City of London pavements to have been from .14 to .23 inch per year. The rate of wear of Penmaen-Mawr and Carnarvonshire sets in Liverpool under the greatest traffic is stated to be seldom more than .02 inch per year. A certain proportion between the depth and the length and breadth of sets is required for stability. A shallow stone is more easily tilted up by a heavy weight coming on one edge, and a narrow stone has a tendency to turn over sideways. The length, measured across the street, must be sufficient to break joint properly, as two or more joints nearly in a line lead to the formation of grooves. For the softer stones a breadth of 4 or 5 inches may be adopted, but for sets of granite or other hard material, with which the joints must be depended on for foothold, the breadth should not much exceed 3 inches. The depth should not be less than twice the breadth, and, as deeper sets weigh more and cost more than shallower ones and the loss by wear is but slight, there is some reason for not exceeding the minimum depth. Where, however, the speedy relaying of a street pavement is of more importance than a saving in first cost, deeper sets are used, and when they have become so worn as to be uneven the street is relaid with new sets and the old ones are removed to be redressed for use in other streets, the sets being used again and again in less important streets as their depth is reduced. In London sets 3 inches wide, 10 to 15 long, and originally 9 deep are so used. In Liverpool sets of a width to average with the joints, 4 in 14 inches, 5 to 7 inches long, and 6 to $7\frac{1}{2}$ deep according to the traffic are used. In Manchester the sets are 3 to $3\frac{1}{2}$ inches wide, 5 to 7 long, and 5 to 6 deep, or 7 in exceptional situations. Sets should be well squared and not taper from the face downwards; both joints and face should be free from irregular projections. On a concrete foundation sets are generally bedded on a thin layer of sand or fine gravel; sometimes they are laid in a bed of fine cement concrete, enough of which is spread over the concrete foundation to be covered while fresh by the sets, which are put in place and smartly tapped, and the joints are grouted at once with cement grout. To allow the cement to become thoroughly set it is desirable that traffic over the pavement should not be allowed for a fortnight, if that can be arranged. The courses of sets are laid square across the street, no advantage arising from a slanting direction, which makes the wear more irregular. At junctions of streets the courses are laid meeting at an angle at the centre line of the narrower street, so that the courses may not run in the direction of the traffic. On steep inclines the sets are sometimes slightly tilted on their beds, forming a serrated surface to give foothold, and slate has been inserted in the joints for the same purpose. The water channels are formed by two or three courses of sets laid parallel to the kerb.

Jointing. Joints simply filled in with gravel are of course pervious to water, and a grout of lime or cement does not make a permanently watertight joint, as it becomes disintegrated under the vibration of the traffic. Grouted joints, however, make a good pavement when there is a foundation of concrete or broken stone or hard core. Where there is not a regular foundation imperviousness in the joints is of great importance. In some of the Lancashire towns

the joints have for many years past been made by first filling them with clean gravel, well shaken in by ramming, and then pouring in a composition of coal-tar, pitch, and creasote oil. The Manchester pavements are good examples of this system of trusting to impervious jointing to prevent unequal settlement. The foundation, where there is not already an old road surface, is a bed of cinders about 1 foot thick, over which are laid 3 inches of gravel, which are thoroughly consolidated by allowing the traffic to pass over them. The sets are evenly bedded and well rammed after the joints have been filled with clean gravel, ramming and graveling being repeated till the joints are full of gravel. The mixture of coal-tar, pitch, and creasote oil, well boiled, is then poured over the surface and allowed to percolate and fill up all interstices in the joints, and the pavement is finished by covering it with small gravel. Joints so formed are impervious to wet and have a certain amount of elasticity; the foundation is kept dry; and the pavement keeps its form well for many years. The objection is made that in hot weather the composition runs from the joints and makes the streets unpleasant for foot-passengers. This sort of jointing is used in Liverpool and some other large towns, where the sets are laid on a concrete foundation. The elasticity diminishes vibration and noise, and pavements so jointed are said to wear better than others.

A curve like that before described, flattening gradually towards Cross the sides, and having a rise equal to one-sixtieth of the width of section, the carriage-way, is a common cross section for a paved street. Sometimes the rise is even less.

A pavement consisting of broad, smooth, well-jointed blocks of Granite for the wheel tracks, and pitching between for the horse tramway. track, was laid by Walker in Commercial Road (London) for the heavy traffic to the West India Docks in 1825, and similar pavements have been successfully used elsewhere, principally for heavy traffic, in streets only wide enough for one vehicle. In Milan, Turin, and other towns of northern Italy tramways of the same sort are extensively used for the ordinary street traffic. The tractive force required is small, while the foothold on the horse track is good; but the tram-stones are slippery for horses to pass over. The rigidity of the roadway renders it more suitable for slow heavy traffic than for light quick vehicles, and the improvement in other pavements has limited the application of this one in ordinary streets.

Wood Paving.—Wood pavements were introduced in England in 1839. Hexagonal blocks of fir, 6 to 8 inches across and 4 to 6 deep, were bedded in gravel laid on a foundation previously levelled and beaten. The blocks were either bevelled off at the edges or grooved across the face to afford foothold. Other wood pavements were tried in London about the same time, but they soon got out of order from unequal settlement of the blocks, and most of them lasted but a few years. The best of them was Carey's, which consisted of blocks $6\frac{1}{2}$ to $7\frac{1}{2}$ inches wide, 13 to 15 long, and 8 or 9 deep, the sides and ends having projecting and re-entering angles locking the blocks together with the view of preventing unequal settlement. Pavements on this system were laid in Mincing Lane in 1841 and in Gracechurch Street in 1842. In the latter street the blocks appear to have been relaid every three or four years and to have been entirely removed about every eleven years, until the pavement was removed in 1871, to be superseded by asphalt. Experience led to a reduction in the width of the blocks to 4 inches and in the depth to 5 or 6, and the salient and re-entering angles disappeared from the sides. With these modifications Carey's pavement remained in use from 1841 until after the introduction of more modern systems in recent years. The "improved wood pavement" was first used in London in 1871. After the foundation was formed to the proper cross section a bed of sand 4 inches deep was laid, upon which came two layers of inch deal boards saturated with boiling tar, one layer across the other. The wooden blocks were 3 inches wide, 5 deep, and 9 long; they were dipped in tar and laid on the boards with the ends close together, but transversely the courses were spaced by fillets of wood three-fourths of an inch wide nailed to the floor and to the blocks. The joints were filled up with clean pebbles rammed in and were run with a composition of pitch and tar, the surface being dressed with boiling tar and strewed with small sharp gravel and sand. In this pavement a somewhat elastic foundation was provided in the boards, which were also intended to prevent unequal settlement of the blocks; but the solidity of the pavement depended upon its water-tightness, for, when the surface water reached the sand, as it did sooner or later, settlement and dislocation of the blocks under the traffic arose. Pavements on this system were laid between 1872 and 1876, and were kept in repair and relaid from time to time, but about 1877 the plank foundation was abandoned for a foundation of cement concrete.

A concrete foundation for a wood pavement appears to have been first employed in a pavement laid in 1872 in Gracechurch Street by the Ligno-Mineral Company. The concrete was of blue lias lime 4 inches thick formed to the curve of the road. The blocks were of beech, mineralized by a special process, $3\frac{1}{2}$ inches wide, $4\frac{1}{2}$ deep, and $7\frac{1}{2}$ long, with the ends cut to an angle of 60° , so that each block might derive support from the next one. They were laid with the

ends inclining in opposite directions in alternate courses. The upper edges of the blocks were chamfered, and there was a chamfered groove near the bottom. In a few years this form of block was abandoned for rectangular blocks, and mineralized fir was substituted for beech. The blocks were bedded in Portland cement and laid with joints one-fourth of an inch wide, partly filled with asphalt and then grouted with mortar. The adoption of a bed of concrete as the weight-bearing foundation of the road marks a new departure, and in all the more recent systems of wood pavement a substantial foundation of concrete is an essential feature. In Norwich, however, a large quantity of wood pavement has been laid on the old street foundation, the blocks being bedded in gravel and sand and rammed, and the joints grouted with lime and sand. The experience of from four to seven years has proved the pavements to be successful, but the foundation is exceptionally dry and hard and the traffic not very heavy. With a concrete foundation there is no reason for complicated shapes and contrivances for locking the blocks together; and wood pavements in their modern form consist of rectangular blocks (obtained by cutting off the end of a deal plank), bedded on the concrete with the fibres of the wood vertical, thus constituting a slightly elastic wearing surface on a rigid foundation, by which the weight of the traffic is borne. There is, however, considerable variation in the method of bedding and jointing the blocks. The Asphaltic Wood Pavement Company laid half an inch of asphalt upon the concrete, and formed the lower part of the joint of asphalt and the upper part of a grout of Portland cement and gravel, the advantage claimed being a slightly elastic bed for the blocks and water-tight joints. The blocks have been laid in unset cement over the concrete and rammed to an even surface; but the ramming is liable to split the blocks, and the indentations formed in the cement surface of the foundation have to be removed when the time comes for renewing the blocks. It is now more usual to bed the blocks directly on the concrete, a smooth surface being formed either with the concrete itself or by a floating of cement, and to fill the joints with a grout of cement and gravel. A cement joint adheres to the blocks, resists wet, and does not wear down too much below the surface of the wood, and so form a receptacle for mud. In Henson's system, which has been largely used, the blocks are bedded and jointed with ordinary roofing felt, a strip of which, cut to a width equal to the depth of the blocks, is placed between every two courses. The joint is made as close as possible by driving up the blocks as every eight or ten courses are laid with heavy mallets, a plank being laid along the face of the work. A perfectly close and slightly elastic joint is thus formed. A continuous layer of felt is likewise laid over the concrete foundation to give a slightly elastic bed to the blocks. A V-shaped groove along the centre of every fourth block was at first considered necessary for foothold, but its use has been discontinued except on gradients steeper than 1 in 30. The surface of the pavement is dressed over with a hot bituminous compound, and covered with fine clean grit. This method of laying a wood pavement, although somewhat more expensive, is probably the best that has hitherto been devised for smoothness and durability. The blocks are laid in courses across the streets, any change in the direction of the latter being accommodated by shorter courses ending with wedge-shaped blocks. At street junctions the courses are laid diagonally, or meeting at right angles. Two or three courses are laid parallel with the kerb to form a water channel. The blocks may be laid close end to end across the street if some allowance be made for expansion by wet, without which the kerbstones and footways will be displaced, or the courses will be bent in reversed curves. To afford relief the joints of the courses parallel to the kerb may be left open, or the course next the kerb may be left out until expansion has ceased, the space being temporarily filled in with sand. In the direction of the traffic joints more or less wide are generally thought necessary for foothold. A wide joint allows the fibres of the wood to spread and give way at the upper corner of the blocks for want of lateral support, and it also forms a receptacle for mud and wet. Experience has shown that the space of three-fourths of an inch or one inch, once thought necessary for foothold, may safely be reduced to one-fourth or three-eighths of an inch. For spacing the courses to form the joints strips of wood of the proper thickness may be laid in and removed before the joints are filled, or they may be nailed to the lower part of the blocks. Two fillets have been nailed on, or three cast-iron studs fixed in the sides of each block to keep them steady in place until the joints are filled and thoroughly set. The latter method secures more uniformity in the width of the joints.

Materials. There is some difference of opinion as to the best material for a wood pavement. Pitch pine and the harder red and yellow deals are the most durable, but they are less elastic than the softer woods, and are apt to wear slippery. Soft white woods have been recommended for the sake of a more elastic surface; but on the whole either Memel or Swedish yellow deal is generally considered the best material. Whatever wood is used, it should be sound, close-grained, even in quality, free from knots and sap, and from the blue tinge which is a sign of incipient decay. After the blocks are cut, all

those that are unsound, knotty, or badly shaped should be carefully rejected, as defective blocks soon cause holes in the surface and must be replaced, or the adjoining blocks will suffer undue wear and the surface become irregular. The breadth of the blocks never now exceeds 4 inches, and it is generally 3, the length being determined by the breadth of the deal or batten from which they are cut. The depth is usually 5 or 6 inches; 5 inches are considered by many to be enough to give sufficient depth for as long as the pavement will retain a sufficiently good surface without renewing the wood, and blocks of that depth have been laid in many London streets. It is doubtful if any advantage is derived from creasoting or from dipping the blocks in creasote oil or coal tar. Dipping affords a cover for the use of defective or inferior wood, and thorough creasoting, though it preserves the wood from decay, has little or no influence on the wear, which in almost all cases determines the life of the blocks.

With a curved cross section like that already described a rise Cross from the mean level of the channels to the crown of the road equal section to one-sixtieth or one-seventieth of the width of the carriage-way is enough. The necessary profile must be accurately given to the concrete foundation when wet. Wooden moulds or templates are fixed across the street 10 or 12 feet apart, over which a straight batten is worked to give the concrete the required form and a smooth surface. The moulds are removed when the concrete is partially set and the spaces are made good with cement mortar. In a level street provision should be made in the foundation for a Foundation fall in the side channels towards the gullies of not less than 1 in 150, and the necessary modifications of cross section at the intersection of streets must also be provided for. Every care should be taken to ensure a good homogeneous concrete for the foundation, as upon that the strength of the road depends. With a well-made Portland cement concrete a thickness of 6 inches is sufficient. It should be allowed to set thoroughly before the blocks are laid, and traffic should not be allowed to pass over it for a week. The finished pavement should be covered with a thin layer of sharp grit, which is forced into the wood by the traffic and forms a hard face. Several applications of grit are desirable at first, and from time to time afterwards, both as a protection to the wood and to prevent slipperiness. Systematic cleansing is required to prevent slipperiness and foul smells, and to preserve the pavement. Cleansing may be aided by washing, and when it is thoroughly carried out but little watering is required to keep down the dust. A wood pavement is the quietest for the residents, pleasant to travel over, and favourable to the wear of vehicles. Traction on it is easy and foothold good, so that it may be laid on gradients as steep as 1 in 20.

The wear of wood pavements in London is stated by Mr Stayton to be from '065 inch per year in Sloane Street, with a traffic of 279 tons per yard of width per day, to '456 inch per year in Fleet Street, with a traffic of 1360 tons per yard of width per day. Reduced to a standard of traffic of 750 tons per yard per day, the comparative annual wear becomes '175 in the former and '251 in the latter street. In Parliament Street, Westminster, blocks removed after four years in places where patching was required had lost $1\frac{1}{2}$ to $1\frac{1}{4}$ inches in thickness, equal to one-third of an inch per year under traffic stated to be 1106 tons per yard of width per day. From information afforded by Mr Haywood it appears that in the City of London under traffic of from 800 to 660 vehicles per yard of width per day of 12 hours the wear is from '2 to '3 inch per year, and that in King William Street, London Bridge, under a traffic of about 1200 vehicles per yard of width in 12 hours the wear was found to be $2\frac{1}{4}$ inches in $3\frac{1}{4}$ years in the middle of the road, or '81 inch per year. This is the heaviest traffic to which wood pavement has been subjected. The wear is generally considered to be as much due to the horses' feet as to the wheels, and the action of the former is more destructive on steep gradients. Towards the end of the life of the blocks the wear is more rapid than at first. Few wood pavements retain a sufficiently good surface after about six years' wear without extensive repairs, and it is probably not advantageous to lay blocks of a greater depth than will provide for a duration of seven years; 5 inches are almost always sufficient for this.

Wood pavements of plain blocks on a cement concrete bed are Cost. now (1885) laid at from 10s. 6d. to 12s. 6d. per square yard, a considerable reduction on the prices paid for patented systems a few years ago. Of the above prices 2s. 3d. to 8s. 9d. is the cost of the foundation, which does not require renewal like the blocks. Assuming the average life of the latter to be seven years, Mr Stayton estimates the annual cost of wood paving in Chelsea with a traffic of 500 to 750 tons per yard of width per day to be 1s. 9d. per square yard, which includes the cost of original construction, repairs and renewals, and interest, spread over fifteen years. Cleansing and sanding are estimated to cost 5d. per square yard in addition.

Asphalt Paving.—Asphalt was first used for street paving in ASHPHALT Paris in 1854. It was introduced in London in 1869, when Thread-needle Street was paved by the Val de Travers Asphalt Company, and since then it has been extensively used for paving both streets and footways. The material is a hard limestone impregnated with bitumen in the proportion of from 6 to 8 per cent. in the Seyssel

rock, and from 10 to 12 in that from Val de Travers. Asphalts containing less than the former proportion have not sufficient coherence for street pavements, and those containing more than the latter proportion soften from heat in the summer. Asphalt is employed either as a mastic or compressed. The mastic is previously prepared in cakes and is melted for use in caldrons with a small quantity of bitumen, and for a street pavement is thoroughly mixed with sand or grit. It is spread in one thickness on a concrete foundation, covered with sand, and beaten to an even surface. This material has not proved so successful for street surfaces as compressed asphalt. To produce this the rock asphalt, previously reduced to a fine powder by mechanical means, is heated in revolving ovens to from 220° to 250°, spread while still hot, and compressed into a solid mass by hot disk-shaped rammers, and afterwards smoothed with irons heated to a dull redness. The original rock is thus as it were reconstructed by taking advantage of the power of coherence of the molecules under pressure when hot. In heating the powder the moisture combined in the limestone must be driven off without reducing the proportion of the bitumen more than is unavoidable. The powder cools very slowly and may be conveyed long distances from the ovens; it may even be kept till the next day before use. When laid it should still retain a temperature of from 150° to 200°. It is spread evenly with a rake by skilled workmen for the whole width of the street to a thickness about two-fifths greater than the finished coating is intended to be. Ramming is commenced with light blows to ensure equality of compression throughout and is continued with increased force until the whole is solidified. The ramming follows up the spreading, so that a joint is required only when the work is interrupted at the end of a day, or from some other cause. In a few hours after it has been laid an asphalt pavement may be used for traffic. When finished, its thickness may be from 1½ to 2½ inches, according to the traffic; a greater thickness than the latter cannot be evenly compressed with certainty. The asphalt loses thickness by compression under the traffic for a long time and to the extent, it is said, of one-fifth or one-fourth, but the wear appears to be very small. A pavement in Paris which had lost more than one-fourth of its thickness was found to have lost only 5 per cent. of its weight after sixteen years' wear. The pavement in Cheapside, after fourteen years under exceptionally heavy traffic, has been reduced, where not repaired, from its original thickness of 2½ to about 1½ inches. The wear-resisting power of the asphalt is due to its elasticity; tracks are made by the wheels at first, but when thoroughly compressed by the traffic the surface retains little or no trace of the heaviest loads. Repairs are easily and quickly made by cutting out defective places and ramming in fresh heated powder, which can be done in the early morning without stopping the traffic. An unyielding foundation is indispensable; it should be of the best Portland cement concrete, 6 inches in thickness, which must be well set and perfectly dry throughout before the asphalt is laid, or the steam generated on the application of the hot powder will prevent coherence and lead to cracks and holes in the asphalt, which quickly enlarge under the traffic. For the same reason the asphalt should be laid in dry weather. The concrete foundation must be carefully formed to the proper profile, with an inclination towards the sides of not more than 1 in 50, which is sufficient with so smooth a surface. About 1 in 50 is the steepest gradient at which an asphalt pavement can be safely laid. When either dry or wet it affords good foothold for horses, but when beginning to get wet, or drying, it is often extremely slippery. This is said to be due to dirt on the surface, and not to the nature of the material. Sand is strewed over the surface to remedy the slipperiness; it tends, however, to wear out the asphalt, and great cleanliness is the best preventive. An asphalt pavement can be kept cleaner than any other, is impervious to moisture, and dries quickly. It is noiseless, except from the clatter of horses' feet on it; it is the pleasantest pavement to travel upon, but it has the drawback of imperfect foothold and slipperiness at times. The cost of a compressed asphalt pavement 2 to 2½ inches thick on a Portland cement concrete foundation 6 inches thick is from 13s. to 16s. a square yard, and the maintenance is usually undertaken for a period of seventeen years by the company laying the pavement, the first two years free and at 3d. to 1s. 6d. per square yard, according to the traffic, in succeeding years.

Comparative cost. *Comparison of Street Surfaces.*—The comparative cost of various street surfaces in Liverpool, including interest on first cost, sinking fund, maintenance, and scavenging, when reduced to a uniform standard traffic of 100,000 tons per annum for each yard in width of the carriage-way, is given by Mr Deacon as follows:—

	Per square yard per year.
Set pavement of hard granites	11½d.
" softer granites	1s. 2½d.
Bituminous concrete	1s. 10½d.
Wood pavement	2s. 2½d.
Macadam, on hand-pitched foundation	2s. 11½d.

Taking the standard of traffic at 40,000 tons per annum for each yard in width, the cost for the last three pavements is:—

	Per square yard per year.
Bituminous concrete	1s. 1½d.
Wood pavement	1s. 8½d.
Macadam	1s. 11½d.

Asphalt paving may be placed between wood and bituminous concrete in the above order. These comparisons show the high cost of a macadamized surface in a street where the traffic is great. However well it may be maintained, a macadamized street must be dirtier and dustier than any pavement, though it is superior to them all in safety and to set pavements in the matter of noise. Bituminous concrete or asphalt macadam is cheaper, cleaner, and quieter than ordinary macadam and is sufficiently durable when the traffic is not heavy. For heavy traffic no pavement is so economical as granite sets; but for the sake of quiet and cleanliness a wood or asphalt pavement is often preferable. Asphalt can be kept cleaner than any other pavement and is the pleasantest to travel over; wood, on the other hand, is quieter for the residents, less slippery, and can be laid on steeper gradients.

The comparative ease of draught on various surfaces is largely influenced by the amount of foothold afforded, and it may be doubted if dynamometer experiments, however carefully made, are altogether conclusive. The tractive force is influenced by the gradient, the diameter of the wheels, the friction of the wheel axles, and the speed, as well as by the resistance of the road surface, and these must be all taken into account to obtain accurate results. Some recent experiments made, under the direction of Sir J. W. Bazalgette, with Easton and Anderson's horse dynamometer on London street surfaces gave the following mean results:—

	Tractive force on the level.
Macadamized surface	40·7 to 44·29 lb per ton.
Asphalt	39·0 „ 39·32 „
Wood	33·02 „ 36·03 „
Granite sets	26·2 „ 27·0 „

The gross load was 4 tons, drawn at a speed of from 2 to 6 miles an hour. It is remarkable that the tractive force on asphalt is so high; but the other results are consistent with former experiments by Morin, Macneill and others.

The comparative safety of granite, wood, and asphalt pavements. Safety in the City of London was the subject of careful observations, which were fully reported on by Mr W. Haywood in 1873. The pavements selected were granite sets 3 inches wide, ligno-mineral pavement of beech blocks 3½ inches wide, improved wood pavement of fir blocks 3 inches wide, and Val de Travers compressed asphalt pavement. On known lengths of these the traffic, the accidents to horses, the weather, and other circumstances were observed for fifty days, and when the distance traversed was taken into account it was found that as a mean result a horse might be expected to travel 132 miles on granite without falling, 191 on asphalt, and 446 on the improved wood pavement. The condition of the weather had considerable effect: on the granite when dry a horse might be expected to travel 78 miles without falling, when damp 163, and when wet 537; on wood when damp 193 miles, when wet 432, and when dry 646; on asphalt when damp 125 miles, when wet 192, and when dry 223. It thus appeared that wood pavement was less slippery than either granite or asphalt in a marked degree, it being only more slippery than granite when both pavements were wet. About 85 per cent. of the falls on the wood pavement were falls on the knees, which are less likely to injure the horses and are less inconvenient to the traffic than other falls. On the granite the falls were falls on the knees or complete falls in about equal proportions, with about 7 per cent. of falls on the haunches. On the asphalt 43 per cent. were complete falls and 24 per cent. falls on the haunches.

Watering.—On macadamized roads in Great Britain watering is Water-only good for the road itself when the materials are of a very silicious nature and in dry weather. With other materials the effect is to soften the road and increase wear. In and near towns watering is required for the comfort of the inhabitants, but it should not be more than enough to lay the dust without softening the road, and the amount required for this may be greatly reduced by keeping the surface free from mud, and by sweeping off the dust when slightly wetted. Pavements are watered to cleanse them as well as to lay the dust, but it must be remembered that both wood and asphalt are more slippery when wet, and that therefore watering should be obviated as far as possible by thorough cleansing. Hydrostatic vans, by improvements in the distributing pipes and regulating valves, water a wide track uniformly with an amount of water which can be regulated at pleasure. Where hydrants exist in connexion with a water supply at high pressure, street watering can be effected by a movable hose and jet, a method much more effective in cleansing the surface, but using a much larger quantity of water. Another method which has been tried, but not much used, is to lay perforated pipes at the back of the kerb on each side of the road, from which jets are thrown upon the surface. The first cost is considerable, and the openings for the jets are liable to choke and get out of order. Deliquescent salts have been used for street watering, by which the surface is kept moist, but at the expense of the moisture in the air. Sea water has the same effect in a less degree.

Cleansing.

Cleansing.—The principal streets of a town are generally cleansed daily, either by hand-sweeping and hand-scraping or by machines. Whitworth's machine consists of a series of revolving brooms on an endless chain, whereby the mud or dust is swept up an incline into the cart. A less costly and cumbersome machine consists of a revolving brush mounted obliquely, which sweeps a track 6 feet wide and leaves the dust or mud on one side to be gathered up by hand. A horse scraping-machine which delivers the mud at the side is also used, the blades of the scrapers being mounted obliquely and covering a width of 6 feet. For general use, more especially in the country, scraping machines worked by a man from side to side of the road, and scraping a width of about 4 feet, are more convenient.

All street surfaces suffer from the constant breaking up and disturbance to which they are subjected for the purpose of laying and repairing gas and water pipes. Subways, either under the middle of the road or near the kerbs, in which the pipes may be laid and be always accessible, have often been advocated, and in a few instances have been constructed; but they have not hitherto found general favour.

Footways.

Footways.—Gravel is the most suitable material for country or suburban footways; it should be bottomed with a coarser material, well drained, and should be laid with a roller. An inclination towards the kerb of about half an inch in a foot may be given, or the surface may be rounded, to throw off the wet. Where greater cleanliness is desirable and the traffic is not too great a coal-tar concrete similar to that already described, but of smaller materials, makes a good and economical footway. The coating should be 2½ or 3 inches thick, composed of two or three layers each well rolled, the lower layer of materials of about 1½ inches gauge, and the upper of a half or a quarter of an inch gauge, with Derbyshire spar, or fine granite chippings over all. Concrete footways require to be carefully made and must be allowed to set thoroughly before they are used. Concrete has a tendency to crack from contraction, especially when in a thin layer, and it is better to lay a footway in sections, with joints at intervals of about 2 yards. Concrete slabs, especially when silted and constituting artificial stone, make an excellent footway. The material is composed of crushed granite, gravel, or other suitable material, mixed with Portland cement and cast in moulds, and when set saturated with silicate of soda. This paving has proved more durable than York stone flagging, but it is more slippery, especially when made with granite. York stone makes a good and pleasant foot pavement, but is somewhat expensive considering its durability; it is apt to wear unevenly and to scale off when the stone is not of the best quality. It should not be laid of a less thickness than 2 inches; 2½ or 3 inches are more usual. The flags should be square jointed, not under-cut at the edges, and should be well bedded and jointed with mortar. Caithness flag is much more durable than York stone and wears more evenly; it is impervious to wet and dries quickly by evaporation. The edges are sawn, and the hardness of the stone renders it difficult to cut it to irregular shapes or to fit openings. Staffordshire blue bricks and bricks made of scoria from iron furnaces are both very durable, though somewhat brittle. Asphalt either laid as mastic or compressed is extensively used for footways; the former is considered inferior in durability to York stone and the latter superior to it. Asphalt should not be laid less than three-fourths of an inch thick on 4 inches of cement concrete, and 1 inch of asphalt is desirable where there is great traffic.

Kerbing.

Footways in a street must be retained by a kerbing of granite, York stone, Purbeck, or other stone sufficiently strong to stand the blows from wheels to which it is subjected. It should be at least 4 inches wide and 9 deep and in lengths of not less than 3 feet. A granite kerb is usually about 12 by 6 inches, either placed on edge or laid on the flat. When set on edge a kerb is generally bedded on gravel with a mall; when laid on the flat a concrete bed is desirable.

Side channels.

In a macadamized street pitched or paved water channels are required, to prevent the wash of the surface water from undermining the kerb. The pitching consists of cubical blocks of hard stone about 4 inches deep, bedded on sand or mortar, or preferably on a bed of concrete. A paved channel consists of flat stones about 1 foot wide inclining slightly towards the kerb. Moulded bricks and artificial stone are also used both for side channelling and for kerbing. Such an inclination must be given to the channel as will bring the surface water to gullies placed at proper intervals, and the level of the kerbing and consequently of the footway will depend to some extent on the surface drainage as well as on the levels of adjacent houses. To lay out a street satisfactorily the longitudinal and transverse sections must be considered in relation to these matters as well as to the levels of intersecting streets.

For fuller information on the subject see Sir Henry Parnell, *A Treatise on Roads*; Thomas Codrington, *The Maintenance of Macadamized Roads*; Debaux, *Manuel de l'Ingénieur des Ponts et Chaussées*; *Annales des Ponts et Chaussées*; *Minutes of Proc. Inst. Civ. Eng.*, "Street Pavements," vol. lviii, p. 1, and "Wood Pavements," vol. lxxviii, p. 240; *Reports by W. Haywood, Engineer to the commissioners of sewers of the City of London.* (T. C.)

ROANNE, a town of France, at the head of an arrondissement in the department of the Loire, lies on the left bank of the Loire in 46° 2' 26" N. lat. at a height of 912 feet above the sea. It is now the point of junction for the railway from Paris (262 miles north-north-west) to Lyons (50 miles south-east), *via* Tarare, with the line from Paris to St Étienne (50 miles south-south-east), and a branch connecting Roanne with Paray le Monial; and as the terminus of the Roanne-Digoin Canal (1832-38) the town is the real starting-point of the Loire navigation. Besides the modern town-house (1868-73), it is enough to mention the ruins of a castle with a tower dating from the 11th century, and a fine bridge of seven arches connecting Roanne with the industrial suburb of Le Côtéau on the right bank of the river. Cotton is the staple manufacture, employing 1200 hands. Hosiery, hats, woollen yarn, weaving looms, chemicals, and paper are also produced; and, as the town stands in the centre of the Loire and Rhone coal-field (output 4224 tons in 1884) and in the neighbourhood of the St Étienne coal-field, it has a considerable trade in coal and coke. In 1881 Roanne had a population of 24,992.

Roanne (*Rodonna*, Ptolemy; *Roidonna*, Tab. Peut.) was an ancient city of the Segusiani and a station on the great Roman road from Lyons to the ocean. The absence of coins later than the time of Constantius II. among the numerous local relics of the Roman period seems to show that the town was sacked by the barbarians in the 4th century. In 1447 the lordship of Roanne became the property of the celebrated banker Jacques Cœur. A favourite scheme of his was to make the town a great industrial centre by regulating the course of the Renaison, an affluent from the Monts de la Madeleine which joins the river a little higher up; his death prevented its execution, but the subject has since been frequently revived.

ROBBERY. See THEFT.

ROBBIA, DELLA, the name of a family of great distinction in the annals of Florentine art. Its members are enumerated in chronological order below.¹

I. LUCA DELLA ROBBIA (1399 or 1400²-1482) was the son of a Florentine named Simone di Marco della Robbia. According to Vasari, whose account of Luca's early life is little to be trusted, he was apprenticed to the silversmith Leonardo di Ser Giovanni, who from 1355 to 1371 was working on the grand silver altar frontal for the cathedral at PISTOIA (*q.v.*); this, however, appears doubtful from the great age which it would give to Leonardo, and it is more probable that Luca was a pupil of Ghiberti. During the early part of his life Luca executed many important and exceedingly beautiful pieces of sculpture in marble and bronze. In technical skill he was quite the equal of Ghiberti, and, while possessing all Donatello's vigour, dramatic power, and originality, he very frequently excelled him in grace of attitude and soft beauty of expression. No sculptured work of the great 15th century ever surpassed the singing gallery which Luca made for the cathedral at Florence between 1431 and 1440, with its ten magnificent panels of singing angels and dancing boys, far exceeding in beauty those which Donatello in 1433 sculptured for the opposite gallery in the same choir. This magnificent work now lies scattered in various parts of the

¹ Genealogical tree of Della Robbia sculptors:—
Simone di Marco.

² Not 1388, as Vasari says. See a document printed by Gaye, *Carteggio Inedito*, i. pp. 182-186.

Bargello. The general effect of the whole can best be seen at the South Kensington Museum, where a complete cast is fixed to the wall. The same museum possesses a study in *gesso duro* for one of the panels, which appears to be the original sketch by Luca's own hand.

In May 1437 Luca received a commission from the signoria of Florence to execute five reliefs for the north side of the campanile, to complete the series begun by Giotto and Andrea Pisano. These panels are so much in the earlier style of Giotto that we must conclude that he had left drawings from which Luca worked. They have representative figures chosen to typify grammar, logic, philosophy, music, and geometry,—the last represented by Euclid and Ptolemy.¹ In 1438 Luca received an order for two marble altars for chapels in the cathedral, a third being ordered from Donatello. The reliefs from one of Luca's—St Peter's Deliverance from Prison and his Crucifixion—are now in the Bargello. It is probable that these altars were never finished. A tabernacle for the host, made by Luca in 1442, is now at Peretola in the church of S. Maria. A document in the archives of S. Maria Nuova at Florence shows that he received for this 700 florins 1 lira 16 soldi (about £1400 of modern money). In 1437 Donatello received a commission to cast a bronze door for one of the sacristies of the cathedral; but, as he delayed to execute this order, the work was handed over to Luca on 28th February 1446, with Michelozzo and Maso di Bartolomeo as his assistants. Part of this wonderful door was cast in 1448, and the last two panels were finished by Luca in 1467, with bronze which was supplied to him by Verrocchio.² The door is divided into ten square panels, with small heads in the style of Ghiberti projecting from the framing. The two top subjects are the Madonna and Child and the Baptist, next come the four Evangelists, and below are the four Latin Doctors,

are perfect models of plastic art, and are quite free from the over-elaboration and too pictorial style of Ghiberti. Fig. 1 shows one of the panels. A terra-cotta relief at Berlin and another in the South Kensington Museum are probably original studies by Luca for two of the panels of the doctors.

The most important existing work in marble by Luca (executed in 1457-58)³ is the tomb of Benozzo Federighi, bishop of Fiesole, originally placed in the church of S. Pancrazio at Florence, but now in S. Francesco di Paola on the Bello Sguardo road outside the city. A very beautiful effigy of the bishop in a restful pose lies on a sarcophagus sculptured with graceful reliefs of angels holding a wreath, which contains the inscription. Above are three-quarter-length figures of Christ between St John and the Virgin, delicately carved in low relief. The whole is surrounded by a rectangular frame formed of painted majolica tiles of the most exquisite beauty, far surpassing any other existing work of the same sort. On each tile is painted, with enamel pigments, a bunch of flowers and fruit in brilliant realistic colours, the loveliness of which is very hard to describe. The perfect mean between truth to nature and decorative treatment has never been more thoroughly obtained than in these wonderful tile pictures, each of which is worthy of the most careful study; and they are also of special interest as being among the earliest examples of Italian majolica. Though the bunch of flowers on each is painted on one slab, the ground of each tile is formed of separate pieces, fitted together like a kind of mosaic, probably because the pigment of the ground required a different degree of heat in firing from that needed for the enamel painting of the centre. The few other works of this class, which exist do not approach the beauty of this early essay in majolica painting, on which Luca evidently put forth his utmost skill and patience.

In the latter part of his life Luca was mainly occupied with the production of terra-cotta reliefs covered with enamel,—a process which he improved upon, but did not invent, as Vasari asserts. The secret of this process was to cover the clay relief with an enamel formed of the ordinary ingredients of glass (*marzacotto*) made an opaque white by oxide of tin,—a method practised with great success in the 13th century in Persia⁴ (see POTTERY, vol. xix. pp. 620, 628). Though Luca was not the inventor of the process, yet his genius so improved and extended its application that it is not unnaturally known now as Della Robbia ware; it must, however, be remembered that by far the majority of these reliefs which in Italy and elsewhere are ascribed to Luca are really the work of some of the younger members of the family. Comparatively few exist which can with certainty be ascribed to Luca himself. Among the earliest of these are medallions of the four Evangelists in the vault of Brunelleschi's Pazzi chapel in S. Croce. These fine reliefs are coloured with various metallic oxides in different shades of blue, green, purple, yellow, and black. It has often been asserted that the very polychromatic reliefs belong to Andrea or his sons, and that Luca's were all in pure white; this, however, is not the case: colours were used more freely by Luca than by his successors. A relief in the South Kensington Museum furnishes a striking example and is of especial value from its great size, and also because its date is known. This is an enormous medallion containing the arms of René of Anjou and other heraldic devices; it is

FIG. 1.—Bronze relief of one of the Latin Doctors, from the sacristy door in the cathedral of Florence, by Luca.

each subject with attendant angels. The whole is modelled with the most perfect grace and dignified simplicity; the heads throughout are full of life, and the treatment of the drapery in broad simple folds is worthy of a Greek sculptor of the best period of Hellenic art. These exquisite reliefs

¹ Vasari is not quite right in his account of these reliefs: he speaks of Euclid and Ptolemy as being in different panels.

² See Cavallucci, *S. Maria del Fiore*, pt. ii. p. 137.

³ Gaye, *Carteggio Inedito*, i. p. 183.

⁴ It is described by Theophilus, *Diversarum Artium Schedula* (11th century), and by Pietro del Bono in his *Margarita preciosa* (1330). An example earlier than any of Luca's exists at Florence over the door of S. Egidio (in S. Maria Nuova). It is a relief of the Coronation of the Virgin executed by Lorenzo de' Bicci in 1424; see Milanese, *Archivio Storico Italiano*, 1860, pp. 182-183. Contemporary writers call this enamelled clay "terra invetriata."

surrounded by a splendidly modelled wreath of fruit and flowers, especially apples, lemons, oranges, and fir cones, all of which are brilliantly coloured. This medallion was set up on the façade of the Pazzi Palace to commemorate René's visit to Florence in 1442. Another early relief by Luca, also highly polychromatic, is that of the Ascension in the tympanum of one of the sacristy doors in the cathedral, executed between 1446 and 1450, as is recorded in a document published by Rumohr (*Italien. Forsch.*, ii. pp. 364-365). Other existing works of Luca in Florence are the tympanum reliefs of the Madonna between two Angels in the Via dell' Agnolo, a work of exquisite beauty, and another over the door of S. Pierino del Mercato Vecchio. The only existing statues by Luca are two lovely enamelled figures of Kneeling Angels holding candlesticks, now in the canons' sacristy.¹ A very fine work by Luca, executed between 1449 and 1452, is the tympanum relief of the Madonna and four Monastic Saints over the door of S. Domenico at Urbino.² Luca also made the four coloured medallions of the Virtues set in the vault over the tomb of the young cardinal-prince of Portugal in a side chapel of S. Miniato in Florence (see ROSSELLINO). By Luca also are reliefs of the Madonna and various medallions outside Or San Michele. One of his chief decorative works which no longer exists was a small library or study for Piero de' Medici, wholly lined with painted majolica plaques and reliefs.³ The South Kensington Museum possesses twelve circular plaques of majolica ware painted in blue and white with the Occupations of the Months; these have been attributed to Luca, but have no resemblance to any known works of his. Their provenance is unknown.

In 1471 Luca was elected president of the Florentine artists' guild, but he refused this great honour on account of his age and infirmity. It shows, however, the very high estimation in which he was held by his contemporaries. He died on 20th February 1482, leaving his property to his nephews Andrea and Simone.⁴ His chief pupil was his nephew Andrea, and probably also Agostino di Duccio, who executed many pieces of sculpture at Rimini, and the graceful but mannered marble reliefs of angels on the façade of S. Bernardino at Perugia.⁵ Vasari calls this Agostino Luca's brother, but he was not related to him at all.

II. ANDREA DELLA ROBBIA (1435-1525), the nephew and pupil of Luca, carried on the production of the enamelled reliefs on a much larger scale than his uncle had ever done; he also extended its application to various architectural uses, such as friezes and to the making of lavabos (lavatories), fountains, and large retables. The result of this was that, though the finest reliefs from the workshop of Andrea were but little if at all inferior to those from the hand of Luca, yet some of them, turned out by pupils and assistants, reached only a lower standard of merit. Only one work in marble by Andrea is known, namely, an altar in S. Maria delle Grazie near Arezzo, mentioned by Vasari (ed. Milanese, ii. p. 179), and still well preserved.

One variety of method was introduced by Andrea in his enamelled work; sometimes he omitted the enamel

on the face and hands (nude parts) of his figures, especially in those cases where he had treated the heads in a realistic manner; as, for example, in the noble tympanum relief of the meeting of St Dominic and St Francis in the loggia of the Florentine hospital of S. Paolo,—a design suggested by a fresco of Fra Angelico's in the cloister of St Mark's. One of the most remarkable works by Andrea is the series of medallions with reliefs of Infants in white on a blue ground set on the front of the foundling hospital at Florence. These lovely child-figures are modelled with wonderful skill and variety, no two being alike. Andrea produced, for guilds and private persons, a large number of reliefs of the Madonna and Child varied with much invention, and all of extreme beauty of pose and sweetness of expression. These are frequently framed with realistic and yet very decorative garlands of fruit and flowers, all painted with enamel colours, while the main relief is left white. Fig. 2 shows a good example of these

FIG. 2.—Enamelled clay relief of Virgin and Child, by Andrea.

smaller works. The hospital of S. Paolo, near S. Maria Novella, has also a number of fine medallions with reliefs of saints, two of Christ Healing the Sick, and two fine portraits, under which are white plaques inscribed—"dall' año 1451 all' año 1495"; the first of these dates is the year when the hospital was rebuilt owing to a papal brief sent to the archbishop of Florence. Arezzo possesses a number of fine enamelled works by Andrea and his sons—a retable in the cathedral with God holding the Crucified Christ, surrounded by angels, and below, kneeling figures of S. Donato and S. Bernardino; also in the cathedral is a fine relief of the Madonna and Child with four saints at the sides. In S. Maria in Grado is a very noble retable with angels holding a crown over a standing figure of the Madonna; a number of small figures of worshippers take refuge in the folds of the Virgin's mantle, a favourite motive for sculpture dedicated by guilds or other corporate

¹ The South Kensington Museum possesses what seem to be fine replicas of these statues.

² The document in which the order for this and the price paid for it are recorded is published by Yriarte, *Gaz. d. Beaux Arts*, xxiv. p. 143.

³ It is fully described by Filarete in his *Trattato dell' Architettura*, written in 1464, and therefore was finished before that date; see also Vasari, ed. Milanese, Florence, 1880, ii. p. 174.

⁴ His will, dated 19th February 1471, is published by Gaye, *Cart. Med.*, i. p. 185.

⁵ In the works of Perkins and others on Italian sculpture these Perugian reliefs are wrongly stated to be of enamelled clay.

bodies. Perhaps the finest collection of works of this class is at La Verna, not far from Arezzo (see Vasari, ed. Milanese, ii. p. 179). The best of these, three large retables with representations of the Annunciation, the Crucifixion, and the Madonna giving her Girdle to St Thomas, are probably the work of Andrea himself, the others being by his sons. In 1489 Andrea made a beautiful relief of the Virgin and two Angels, now over the archive room door in the Florentine Opera del Duomo; for this he was paid twenty gold florins (see Cavallucci, *S. Maria del Fiore*). In the same year he modelled the fine tympanum relief over a door of Prato cathedral, with a half-length figure of the Madonna between St Stephen and St Lawrence, surrounded by a frame of angels' heads.

In 1491 Andrea was still working at Prato, where many of his best reliefs still exist. One of his finest works is a large retable at Volterra in the church of S. Girolamo, dated 1501; it represents the Last Judgment, and is remarkable for the fine modelling of the figures, especially that of the archangel Michael, and a nude kneeling figure of a youth who has just risen from his tomb. Other late works of known date are a Resurrection of Christ, made in 1501 for S. Frediano at Florence (the lower half of this only exists, in the court of the Casa Mozzi), and a medalion of the Virgin in Glory, surrounded by angels, made in 1505 for Pistoia cathedral.¹ Andrea's last known relief is a Nativity, made in 1515 for S. Maria in Pian di Mugnone at Florence.²

III., IV. Five of Andrea's seven sons worked with their father, and after his death carried on the Robbia fabrique; the dates of their birth are shown in the table on p. 588 above. Early in life two of them came under the influence of Savonarola, and took monastic orders at his Dominican convent; these were MARCO, who adopted the name of Fra Luca, and PAOLO, called Fra Ambrogio. One relief by the latter, a Nativity with four life-sized figures of rather poor work, is in the Cappella degli Spagnuoli in the Sienese convent of S. Spirito; a MS. in the convent archives records that it was made in 1504.

V. The chief existing work known to be by the second son LUCA is the very rich and beautiful tile pavement in the uppermost story of Raphael's loggie at the Vatican, finely designed and painted in harmonious majolica colours. This was made by Luca at Raphael's request and under his supervision in 1518.³ It is still in very fine preservation.

VI. GIOVANNI DELLA ROBBIA (1469-1529?) during a great part of his life worked as assistant to his father, Andrea, and in many cases the enamelled sculpture of the two cannot be distinguished. Some of Giovanni's independent works are of great merit, especially the earlier ones; during the latter part of his life his reliefs deteriorated in style, owing mainly to the universal decadence of the time. A very large number of pieces of Robbia ware which are attributed to Andrea, and even to the elder Luca, were really by the hand of Giovanni. One of his finest works, quite equal in beauty to anything of his father's, from whom the design of the figures was probably taken, is the washing-fountain in the sacristy of S. Maria Novella at Florence, made in 1497.⁴ It is a large arched recess with a view of the seashore, not very decorative in style, painted on majolica tiles at the back. There are also two very beautiful painted majolica panels of fruit-trees let into the lower part. In the tympanum of the arch is a very lovely white

relief of the Madonna between two Adoring Angels (see fig. 3). Long coloured garlands of fruit and flowers are held

FIG. 3.—Relief of Madonna and Angels in the tympanum of the lavabo (S. Maria Novella, Florence), by Giovanni.

by nude boys reclining on the top of the arch. All this part is of enamelled clay, but the basin of the fountain is of white marble. Neither Luca nor Andrea was in the habit of signing his work, but Giovanni often did so, usually adding the date, probably because other potters had begun to imitate the Robbia ware.⁵

Giovanni lacked the original talent of Luca and Andrea, and so he not only copied their work but even reproduced in clay the marble sculpture of Pollaiuolo, Da Settignano, Verrocchio, and others. A relief by him, evidently taken from Mino da Fiesole, exists in the Palazzo Castracane Staccoli. Among the very numerous other works of Giovanni are the large retable in the Castellani chapel of S. Croce, a relief in the wall of a convent in the Via Nazionale at Florence, and two reliefs in the Bargello dated 1521 and 1522. The latter is a many-coloured relief of the Nativity, and was taken from the church of S. Girolamo in Florence; it is a too pictorial work, marred by the use of many different planes. Its predella has a small relief of the Adoration of the Magi, and is inscribed "Hoc opus fecit Joanes Andree de Robbia, ac posuit hoc in tempore die ultima lulii a^{no}. Dñi. m^occxxii." At Pisa in the church of S. Silvestro is a relief in Giovanni's later and poorer manner dated 1520; it is a Madonna surrounded by angels, with saints below—the whole overcrowded with figures and ornaments. Giovanni's largest and perhaps finest work is the polychromatic frieze on the outside of the Del Ceppo Hospital at Pistoia, for which he received various sums of money between 1525 and 1529, as is recorded in documents which still exist among the archives of the hospital.⁶ The subjects of this frieze are the Seven Works of Mercy, forming a continuous band of sculpture in high relief, well modelled and designed in a very broad sculptural way, but a little injured perhaps by the crudeness of some of its colouring. Six of these reliefs are by Giovanni, namely, Clothing the Naked, Washing the Feet of Pilgrims, Visiting the Sick, Visiting Prisoners, Burying the Dead, and Feeding the Hungry. The seventh,

³ It is illustrated by Gruner, *Fresco Decorations of Italy*, London, 1854, pl. iv.; see also Müntz, *Raphael, sa Vie*, &c., Paris, 1881, p. 452, note i., and Vasari, ed. Milanese, ii. p. 182.

⁴ See a document printed by Milanese in his Vasari, ii. p. 193.

⁵ Examples of these imitations are a retable in S. Lucchese near Poggibonsi dated 1514, another of the Madonna and Saints at Monte San Savino of 1525, and a third in the Capuchin church of Arceria near Sinigaglia; they are all inferior to the best works of the Robbia family.

⁶ The hospital itself was begun in 1514.

Giving Drink to the Thirsty, was made by Filippo Paladini of Pistoia in 1585; this last is of terra-cotta, not enamelled, but simply painted with oil colours. Giovanni also executed the medallions in the spandrels of the arches under this frieze, with reliefs of the Annunciation, the Visitation, and the Coronation of the Virgin.

A large octagonal font of enamelled clay, with pilasters at the angles and panels between them with scenes from the life of the Baptist, in the church of S. Leonardo at Cerreto Guidi, is a work of the school of Giovanni; the reliefs are pictorial in style and coarse in execution. Giovanni's chief pupil was a man named Santi, who was at first apprenticed to Buglioni,¹ and when the latter died in 1521 he went into Giovanni's bottega. His work is very inferior to that of his master.

VII. GIROLAMO DELLA ROBBIA (1488-1566), another of Andrea's sons, was an architect and a sculptor in marble and bronze as well as in enamelled clay. During the first part of his life he, like his brothers, worked with his father, but in 1528 he went to France and spent nearly forty years in the service of the French royal family. Francis I. employed him to build a palace in the Bois de Boulogne called the Château de Madrid. This was a large well-designed building, four stories high, two of them having open loggias in the Italian fashion. Girolamo decorated it richly with terra-cotta medallions, friezes, and other architectural features.² For this purpose he set up kilns at Suresnes. Though the palace itself has been destroyed, drawings of it exist.³

The best collections of Robbia ware are in the Florentine Bargello and Accademia, the South Kensington Museum (the finest out of Italy), the Louvre, the Cluny, and the Berlin Museums. Many fine specimens exist in Paris in the private collections of M. Alphonse de Rothschild, M. Gavel, and M. Dreyfus. The greater part of the Robbia work still remains in the churches and other buildings of Italy, especially in Florence, Fiesole, Arezzo, La Verna, Volterra, Barga, Montepulciano, Lucca, Pistoia, Prato, and Siena. The best accounts of the Della Robbia family are those given by De Jouy, *Les Della Robbia*, Paris, 1855; Bode, *Die Künstlerfamilie Della Robbia*, Leipzig, 1878; and Cavallucci and Molinier, *Les Della Robbia*, Paris, 1884, an ably-written and well-illustrated work. See also Vasari, ed. Milanese, Florence, 1880, ii. p. 167 sq., and various works on Italian sculpture. (J. H. M.)

ROBERT I., king of France, son and successor of Hugh Capet, was born at Orleans in 971 and died at Melun in 1031. See FRANCE, vol. ix. p. 536. He is sometimes cited as Robert II., Robert I. being then taken to mean Robert, duke of France (ob. 923), the second son of Robert "the Strong" (ob. 866); comp. FRANCE, vol. ix. p. 535.

ROBERT, called THE BRUCE⁴ (1274-1329), king of Scotland, was the son of the seventh Robert de Bruce, lord of Annandale in his own right and earl of Carrick in right of his wife Marjory, daughter of Neil, second earl, and thus was of mingled Norman⁵ and Celtic blood. His

¹ Benedetto Buglioni (1461-1521) appears to have produced enamelled ware independently of the Robbia family. In 1484 he made a relief of the Harrowing of Hell for the Servite monks at Florence; see Baldinucci, *Notizie de' Professori del Disegno*, Milan, 1811, vi. p. 18.

² The Sèvres Museum possesses some fragments of these decorations.

³ See Laborde, *Château de Madrid*, Paris, 1853, and *Comptes des Bâtimens du Roi*, Paris, 1877-80, in which a full account is given of Girolamo's work in connexion with this palace.

⁴ For ROBERT II. (1316-1390) and ROBERT III. (d. 1406) of Scotland, see SCOTLAND.

⁵ The first Robert de Bruce, a follower of William the Conqueror, was rewarded by the gift of many manors, chiefly in Yorkshire, of which Skelton was the principal. His son, the second Robert, received from David I., his comrade at the court of Henry I., a grant of the lordship of Annandale, and his grandson, the third Robert, siding with David against Stephen at the battle of the Standard, became a Scottish instead of an English baron. The fourth Robert married Isobel, natural daughter of William the Lion, and their son, the fifth Robert, married Isabella, second daughter of David, earl of Huntingdon, niece of the same Scottish king. Thus royal kin made natural the ambition to gain a crown,—an object not beyond the ambition of a powerful noble in feudal times.

grandfather, the sixth Robert de Bruce, claimed the crown of Scotland as son of Isabella, second daughter of David, earl of Huntingdon; but Baliol, grandson of Margaret, the eldest daughter, was preferred by the commissioners of Edward I. The birthplace of the Bruce—perhaps Turnberry, his mother's castle, on the coast of Ayr—is not certainly known. His youth is said by an English chronicle to have been passed at the court of Edward I. At an age when the mind is quick to receive the impressions which give the bent to life he must have watched the progress of the great suit for the crown of Scotland. Its issue in favour of Baliol led to the resignation of Annandale by Bruce the competitor to his son, the Bruce's father, who, either then or after the death of the aged competitor in 1295, assumed the title of lord of Annandale. Two years before he had resigned, on the death of his wife, the earldom of Carrick to Robert the Bruce, who presented the deed of resignation to Baliol at Stirling on 3d August 1293, and offered the homage which his father, like his grandfather, was unwilling to render. Feudal law required that the king should take sasine of the earldom before regranting it and receiving the homage, and the sheriff of Ayr was directed to take it on Baliol's behalf. As the disputes between Edward and Baliol, which ended in Baliol losing the kingdom, commenced in this year it is doubtful whether Bruce ever rendered homage; but he is henceforth known as earl of Carrick, though in a few instances this title is still given to his father. Both father and son sided with Edward against Baliol. Towards the end of 1292 the elder Robert had a safe-conduct from Edward to visit Norway with a daughter, Isabella, who married Erik, king of Norway, the widower of Margaret of Scotland,—a fact marking the high standing of the family of Bruce. On 20th April 1294 the younger Robert, earl of Carrick, had a similar safe-conduct or permission to visit Ireland till Michaelmas and a year following, and a further mark of Edward's favour by a respite for the same period of all debts due by him to the exchequer. His father, having done homage to Edward, was entrusted in October 1295 with the custody of the castle of Carlisle by a patent in which he is styled lord of Annandale; and Baliol retaliated by seizing Annandale, which he conferred on John Comyn, earl of Buchan. On 28th August 1296 Robert de Bruce "le vieil" and Robert de Bruce "le jeune," earl of Carrick, swore fealty to Edward at Berwick; but (according to Hemingford), in breach of this oath, renewed at Carlisle on the Gospels and the sword of Thomas a Becket, the young earl joined Wallace, who had raised the standard of Scottish independence in the name of Baliol after that weak king had himself surrendered his kingdom to Edward. Urgent letters were sent ordering Bruce to support Warrene, Edward's general, in the summer of 1297; but, instead of complying, he, along with the bishop of Glasgow and the steward of Scotland, laid waste the lands of those who adhered to Edward. On 7th July Percy forced Bruce and his friends to make terms by the treaty called the Capitulation of Irvine. The Scottish lords were not to serve beyond the sea against their will and were pardoned for their recent violence, while in return they owed allegiance to Edward. The bishop of Glasgow, the steward, and Sir Alexander Lindesay became sureties for Bruce until he delivered his daughter Marjory as a hostage. Wallace almost alone maintained the struggle for freedom which the nobles as well as Baliol had given up, and Bruce had no part in the honour of Stirling Bridge or the reverse of Falkirk, where in the following year Edward in person recovered what his generals had lost and drove Wallace into exile. Shortly afterwards Bruce appears again to have sided with his countrymen; Annandale was wasted and Lochmaben taken by Clifford, while Bruce (according

to Hemingford), "when he heard of the king's coming, fled from his face and burnt the castle of Ayr which he held." Yet, when Edward was forced by home affairs to quit Scotland, Annandale and certain earldoms, including Carrick, were excepted from the districts he assigned to his followers,—Bruce and the other earls being treated as waverers whose allegiance might still be retained. In 1299 a regency was appointed in Scotland in name of Baliol, and a letter of Baliol mentions Robert Bruce, lord of Carrick, as regent, along with William of Lamberton, bishop of St Andrews, and John Comyn the younger,—a strange combination, Lamberton the friend of Wallace, Comyn the enemy of Bruce, and Bruce a regent in name of Baliol. Comyn in his own interest as Baliol's heir was the active regent; the insertion of the name of Bruce was an attempt to secure his co-operation. For the next four years he kept studiously in the background waiting his time. A statement of Langtoft that he was at the parliament of Lincoln in 1301, when the English barons repudiated the claim of the pope to the suzerainty of Scotland, is not to be credited, though his father may have been there. In the campaign of 1304, when Edward renewed his attempt on Scotland and reduced Stirling, Bruce supported the English king, who in one of his letters to him says, "If you complete that which you have begun we shall hold the war ended by your deed and all the land of Scotland gained." But, while apparently aiding Edward, Bruce had taken a step which bound him to the patriotic cause. On 11th June, a month before the fall of Stirling, he met Lamberton at Cambuskenneth and entered into a secret bond by which they were to support each other against all adversaries and undertake nothing without consulting together. The death of his father in this year may have determined his course and led him to prefer the chance of the Scottish crown to his English estates and the friendship of Edward.

This determination closes the first chapter of his life; the second, from 1304 to 1314, is occupied by his contest for the kingdom, which was really won at Bannockburn, though disputed till the treaty of Northampton in 1328; the last, from 1314 to his death in 1329, was the period of the establishment of his government and dynasty by an administration as skilful as his generalship. It is to the second of these that historians, attracted by its brilliancy even amongst the many romances of history and its importance to Scottish history, have directed most of their attention, and it is during it that his personal character, tried by adversity and prosperity, gradually unfolds itself. But all three periods require to be kept in view to form a just estimate of Bruce. That which terminated in 1304, though unfortunately few characteristics, personal or individual, have been preserved, shows him by his conduct to have been the normal Scottish noble of the time. A conflict of interest and of bias led to contradictory action, and this conflict was increased in his case by his father's residence in England, his own upbringing at the English court, his family feud with Baliol and the Comyns, and the jealousy common to his class of Wallace, the mere knight, who had rallied the commons against the invader and taught the nobles what was required in a leader of the people. The merit of Bruce is that he did not despise the lesson. Prompted alike by patriotism and ambition, at the prime of manhood he chose the cause of national independence with all its perils, and stood by it with a constancy which never wavered until he secured its triumph. Though it is crowded with incidents, the main facts in the central decade of Bruce's life may be rapidly told. The fall of Stirling was followed by the capture and execution of Wallace at London on 24th August 1305. Edward hoped still to conciliate the nobles and gain Scotland by a

policy of clemency to all who did not dispute his authority. A parliament in London (16th September), to which Scottish representatives were summoned, agreed to an ordinance for the government of Scotland, which, though on the model of those for Wales and Ireland, treating Scotland as a third subject province under an English lieutenant, John de Bretagne, was in other respects not severe. Bruce is reputed to have been one of the advisers who assisted in framing it; but a provision that his castle of Kildrummy was to be placed in charge of a person for whom he should answer shows that Edward not without reason suspected his fidelity. Challenged by the king with the bond between him and Lamberton (according to one account discovered by the treachery of John Comyn, with whom a similar engagement had been made or attempted), Bruce secretly quitted London, and on 10th February 1306 met by appointment, in the church of the Friars Minor at Dumfries, Comyn, whom he slew at the high altar for refusing to join in his plans. So much is certain, though the precise incidents of the interview were variously told. It was not their first encounter, for a letter of 1299 to Edward from Scotland describes Comyn as having seized Bruce by the throat at a meeting at Peebles, when they were with difficulty reconciled by the joint regency.

The bond with Lamberton was now sealed by blood and the confederates lost no time in putting it into execution. Within little more than six weeks Bruce, collecting his adherents in the south-west, passed from Lochmaben to Glasgow and thence to Scone, where he was crowned by the bishop of St Andrews on 25th March, the bishops of Glasgow and Moray, with the earls of Lennox, Athole, and Errol, being present. Two days later Isabella, countess of Buchan, claimed the right of her family the Macduffs, earls of Fife, to place the Scottish king on his throne, and the ceremony was repeated with an addition flattering to the Celtic race. Though a king, Bruce had not yet a kingdom, and his efforts to obtain it were till the death of Edward I. disastrous failures. In June he was defeated at Methven by Pembroke, and on 11th August he was surprised in Strathfillan, where he had taken refuge, by Lord Lorn. The ladies of his family were sent to Kildrummy in January, and Bruce, almost without a follower, fled to Rathlin, an island off Antrim (Ireland). Edward, though suffering from his last illness, came to the north in the following spring. On his way he granted the Scottish estates of Bruce and his adherents to his own followers, Annandale falling to the earl of Hereford. At Carlisle there was published a bull excommunicating Bruce, along with another absolving Edward from the oath he had taken to observe Magna Charta and the other charters on which the English constitution rests. Elizabeth the wife, Marjory the daughter, Christina the sister of Bruce, were captured in a sanctuary at Tain and sent prisoners to England. The countess of Buchan was confined in a cage at Berwick and another of Bruce's sisters, Mary, in a cage at Roxburgh. The bishops of St Andrews and Glasgow and the abbot of Scone were suspended from their benefices and sent as prisoners to the south of England. Nigel Bruce, his youngest brother, was beheaded at Berwick, Christopher Seton, his brother-in-law, at Dumfries. The earl of Athole was sent to London and hanged on a gallows 30 feet higher than the pole on which the head of Wallace still stood. Two other brothers of Bruce, Thomas and Alexander (dean of Glasgow), met the same fate at Carlisle. There were many minor victims, but the chronicler of Lanercost notes that the number of those who wished Bruce to be confirmed in the kingdom increased daily. While thus wreaking his vengeance Edward himself was summoned by death at Burgh-on-the-Sands, on the Solway,

on 7th June 1307. By his dying wish the inscription "Edwardus Primus, Scotorum Malleus, Pactum Serva" was put on his tomb. In a moment all was changed. Instead of being opposed to the greatest, Bruce now had as his antagonist the feeblest of the Plantagenets. Quitting Rathlin (after a short stay in Arran), Bruce had before Edward's death attempted to take Turnberry and Ayr, but had failed, though he defeated Pembroke at Loudoun Hill. No sooner was his father dead than Edward II. recalled his banished favourite Gaveston. After wasting the critical moment of the war in the diversions of a youthful court, the new king made an inglorious march to Cumnock and back without striking a blow, and then returned south to celebrate his marriage with Isabella of France, leaving the war to a succession of generals. Bruce, with the insight of military genius, seized his opportunity. Leaving Edward, now his only brother in blood and almost his equal in arms, in Galloway, he suddenly transferred his own operations to Aberdeenshire. In the end of 1307 and again in May 1308 he overran Buchan, where at Inverury on 22d May he defeated its earl, one of his chief Scottish opponents. Then crossing to Argyll he surprised Lord Lorn in the Pass of Brander and took Dunstaffnage. In 1309 a truce, scarcely kept, was effected by the pope and Philip of France, and in 1310, in a general council at Dundee, the clergy of Scotland—all the bishops being present—recognized Bruce as king. The support given him by the national church in spite of his excommunication must have been of great importance in that age, and was probably due to the example of Lamberton. The next three years were signalized by the reduction one by one of the strong places the English still held,—Linthgow in the end of 1310, Dumbarton in October 1311, Perth by Bruce himself in January 1312. Encouraged by these successes, he made a raid into the north of England, and on his return reduced Butel (in Galloway), Dumfries, and Dalswinton, and threatened Berwick. In March 1313 Sir James Douglas surprised Roxburgh, and Randolph surprised Edinburgh. In May Bruce was again in England, and, though he failed to take Carlisle, he subdued the Isle of Man. Edward Bruce about the same time took Rutherglen and laid siege to Stirling, whose governor, Mowbray, agreed to capitulate if not relieved before 24th June 1314. Bruce's rapidity of movement was one cause of his success. His sieges, the most difficult part of mediæval warfare, though won sometimes by stratagem, prove that he and his followers had benefited from their early training in the wars of Edward I. We know that he had been specially employed by that king to prepare the siege-train for his attack on Stirling. By the close of 1313 Berwick and Stirling alone remained English. Edward II. felt that if Scotland was not to be lost a great effort must be made. With the whole available feudal levy of England, a contingent from Ireland, and recruits even out of jails—for murderers were pardoned on condition of joining the army—he advanced from Berwick to Falkirk, which he reached on 22d June. After a preliminary skirmish on Sunday the 23d, in which Bruce distinguished himself by a personal combat with Henry de Bohun, whom he felled by a single blow of his axe, the battle of Bannockburn was fought on Monday the 24th; and the complete rout of the English determined the independence of Scotland and confirmed the title of Bruce. The details of the day, memorable in the history of war as well as of Scotland, have been singularly well preserved, and redound to the credit of Bruce, who had studied in the school of Wallace as well as in that of Edward I. He had chosen and knew his ground,—the New Park between St Ninian's and the Bannock, a petty burn, yet sufficient to produce marshes dangerous to heavily-armed horsemen, while from

the rising ground on his right the enemy's advance was seen. His troops were in four divisions; his brother commanded the right, Randolph the centre, Douglas the left. Bruce with the reserve planted his standard at the Bore Stone, whence there is the best view of the field. His camp-followers on the Gillies' Hill appeared over its crest at the critical moment which comes in all battles. The plain on the right of the marshes was prepared with pits and spikes. But what more than any other point of strategy made the fight famous was that the Scots fought on foot in battalions with their spears outwards, in a circular formation serving the same purpose as the modern square. A momentary success of the English archers was quickly reversed by a flank movement of Sir Robert Keith. The Scottish bowmen followed up his advantage, and the fight became general; the English horse, crowded into too narrow a space, were met by the steady resistance of the Scottish pikemen, who knew Bruce told them truly that they fought for their country, their wives, their children, and all that freemen hold dear. The English rear was unable to come up in the narrow space or got entangled in the broken ranks of the van. The first repulse soon passed into a rout, and from a rout into a headlong flight, in which Edward himself barely escaped. Like Courtrai and Morgarten, Bannockburn marked the momentous change from mediæval to modern warfare. The armed knights gave place to the common soldiers led by skilful generals as the arbiters of the destiny of nations. In the career of Bruce it was the turning-point. The enthusiasm of the nation he had saved forgot his late adhesion to the popular cause, and at the parliament of Ayr on 25th April 1315 the succession was settled by a unanimous voice on him, and, failing males of his body, on his brother Edward and his heirs male, failing whom on his daughter Marjory and her heirs, if she married with his consent. Soon after she married Walter the Steward.

The last part of Bruce's life, from 1315 to 1329, began with an attempt which was the most striking testimony that could have been given to the effect of Bannockburn, and which, had it succeeded, might have altered the future of the British Isles. This was no less than the rising of the whole Celtic race, who had felt the galling yoke of Edward I. and envied the freedom the Scots had won. In 1315 Edward Bruce crossed to Ireland on the invitation of the natives, and in the following year the Welsh became his allies. In autumn Robert came to his brother, and they together traversed Ireland to Limerick. Dublin was saved by its inhabitants committing it to the flames, and, though nineteen victories were won, of which that at Slane in Louth by Robert was counted the chief, the success was too rapid to be permanent. The brothers retreated to Ulster, and, Robert having left Ireland to protect his own borders, Edward was defeated and killed at Dundalk in October 1318. On his return Bruce addressed himself to the siege of Berwick, a standing menace to Scotland. While preparing for it two cardinals arrived in England with a mission from Pope John XXII. to effect a truce, or, failing that, to renew the excommunication of Bruce. The cardinals did not trust themselves across the border; their messengers, however, were courteously received by Bruce, but with a firm refusal to admit the bulls into his kingdom because not addressed to him as king. Another attempt by Newton, guardian of the Friars Minor at Berwick, had a more ignominious result. Bruce admitted Newton to his presence at Aldcamus, where he might see the works for the siege going on by night and day, and was informed that Bruce would not receive the bulls until his title was acknowledged and he had taken Berwick. On his return Newton was waylaid and his papers seized, not without suspicion of Bruce's connivance.

In March 1318 first the town and then the castle of Berwick capitulated, and Bruce wasted the English border as far as Ripon. In December he held a parliament at Scone, where he displayed the same wisdom as a legislator which he had shown as a general. The death of his brother and his daughter rendered a resettlement of the crown advisable, which was made in the same order as before, with a provision as to the regency in case of a minor heir in favour of Randolph, and failing him Douglas. The defence of the country was next cared for by regulations for the arming of the whole nation, down to every one who owned the value of a cow,—a measure far in advance of the old feudal levy. Exports during war and of arms at any time were prohibited. Internal justice was regulated, and it was declared that it was to be done to poor and rich alike. Leasing-making—a Scottish term for seditious language—was to be sternly punished. The nobles were exhorted not to oppress the commons. Reforms were also made in the tedious technicalities of the feudal law. In 1319 an attempt to recover Berwick was repelled by Walter the Steward, and Bruce took occasion of a visit to compliment his son-in-law and raise the walls 10 feet.

His position was now so strong that foreign states began to testify their respect. Bruges and Ypres rejected a request of Edward to cut off the Scottish trade with Flanders. The pope, who had excommunicated Bruce, was addressed by the parliament of Arbroath in 1320 in a letter which compared Bruce to a Joshua or Judas Maccabæus, who had wrought the salvation of his people, and declared they fought “not for glory, truth, or honour, but for that liberty which no virtuous man will survive.” Moved by this language and conscious of the weakness of Edward, the pope exhorted him to make peace with Scotland, and three years later Randolph at last procured the recognition of Bruce as king from the papal see by promising aid in a crusade. In 1326 the French king made a similar acknowledgment by the treaty of Corbeil. Meantime hostilities more or less constant continued with England, but, though in 1322 Edward made an incursion as far as Edinburgh, the fatal internal weakness of his government prevented his gaining any real success. Some of his chief nobles—Lancaster in 1321 and Sir Andrew Hartela in 1322—entered into correspondence with the Scots, and, though Hartela’s treason was detected and punished by his death, Edward was forced to make a treaty for a long truce of thirteen years at Newcastle on 30th May, which Bruce ratified at Berwick. The intrigue of the queen with Roger Mortimer led to the end of the ignominious reign by Edward’s deposition and murder in 1327; and one of the first acts of the new reign, after a narrow escape of the young king from capture by Randolph, was the treaty of York, ratified at Northampton in April 1328, by which it was agreed that “Scotland, according to its ancient bounds in the days of Alexander III., should remain to Robert, king of Scots, and his heirs free and divided from England, without any subjection, servitude, claim or demand whatsoever.” Johanna, Edward’s sister, was to be given in marriage to David, the infant son of Bruce, and the ceremony was celebrated at Berwick on 12th July.

The chief author of Scottish independence barely survived his work. His last years had been spent chiefly at the castle of Cardross on the Clyde, which he acquired in 1326, and the conduct of war, as well as the negotiations for peace, had been left to the young leaders Randolph and Douglas, whose training was one of Bruce’s services to his country. Ever active, he employed himself in the narrower sphere of repairing the castle and improving its domains and gardens, in shipbuilding on the Clyde, and in the exercise of the royal virtues of hospitality and charity. The reli-

gious feeling, which had not been absent even during the struggles of manhood, deepened in old age, and took the form the piety of the times prescribed. He made careful provision for his funeral, his tomb, and masses for his soul. He procured from the pope a bull authorizing his confessor to absolve him even at the moment of death. He died from leprosy, contracted in the hardships of earlier life, on 7th June 1329, and was buried at Dunfermline beside his second wife, Elizabeth de Burgh, whom he had married about 1304, and who bore him late his only son, David, who succeeded him. Of two surviving daughters, Matilda married Thomas Ysaak, a simple esquire, and Margaret became the wife of William, earl of Sutherland. Marjory, an only child by his first wife, Isabella of Mar, had predeceased him. Several children not born in wedlock have been traced in the records, but none of them became in any way famous.

In fulfilment of a vow to visit the Holy Sepulchre, which he could not accomplish in person, Bruce requested Douglas to carry his heart there, but his faithful follower perished on the way, fighting in Spain against the Moors, and the heart of Bruce, recovered by Sir William Keith, found its resting-place at Melrose. When his corpse was disinterred in 1819 the breast-bone was found severed to admit of the removal of the heart, thus confirming the story preserved in the verses of Barbour. That national poet collected in the earliest Scottish poem, written in the reign of Bruce’s grandson, the copious traditions which clustered round his memory. It is a panegyric; but history has not refused to accept it as a genuine representation of the character of the great king, in spirit, if not in every detail. Its dominant note is freedom—the liberty of the nation from foreign bondage, and of the individual from oppression. It is the same note which Tacitus embodied in the speech of Galgacus at the dawn of Scottish history. Often as it has been heard before and since in the course of history, seldom has it had a more illustrious champion than Robert the Bruce. (Æ. M.)

ROBERT, the name of two dukes of Normandy. See NORMANDY, vol. xvii. p. 542 for ROBERT I. (d. 1035) and p. 544 for ROBERT II. (d. 1134); see also ENGLAND, vol. viii. p. 301.

ROBERT, HUBERT (1753-1808), born at Paris in 1753, deserves to be remembered not so much for his skill as a painter as for the liveliness and point with which he treated the subjects he painted. The contrast between the ruins of ancient Rome and the life of his time excited his keenest interest; and, although he had started for Italy on his own responsibility, the credit he there acquired procured him the protection of the minister Marigny and an official allowance. His incessant activity as an artist, his daring character, his many adventures, attracted general sympathy and admiration. In the fourth canto of his *L’Imagination* Delille celebrated Robert’s miraculous escape when lost in the catacombs; later in life, when imprisoned during the Terror and marked for the guillotine, by a fatal accident another died in his place and Robert lived. The quantity of his work is immense; the Louvre alone contains nine paintings by his hand and specimens are frequently to be met with in provincial museums and private collections. In spite of a certain naturalness in details which was wanting to his predecessor Panini, all Robert’s work has more or less of that scenic character which justified the taste of Voltaire when he selected him to paint the decorations of his theatre at Ferney. Robert fell, struck by apoplexy, on 15th April 1808. His brush was in his hand; he had painted till the last moment. He was much engraved by the abbé Le Non, with whom he had visited Naples in the company of Fragonard during his early days; in Italy his work has also been frequently reproduced by Chatelain, Liénard, Le Veau, and others.

See C. Blanc, *Hist. des Peintres*; Villot, *Notice des Tableaux du Louvre*; Julius Meyer, *Gesch. mod. fr. Malerei*.

ROBERT, LOUIS LÉOPOLD (1794-1835), French painter, was born at Chaux de Fonds (Neuchâtel) in Switzerland on 13th May 1794, but left his native place with the en-

graver Girardet at the age of sixteen for Paris. He was on the eve of obtaining the great prize for engraving when the events of 1815 blasted his hopes, for Neufchâtel was restored to Prussia and Robert was struck off the list of competitors as a foreigner. Having fortunately whilst continuing his studies under Girardet never ceased to frequent the studio of David, he now determined to become a painter, and only returned to his native country when his master himself was exiled. At Neufchâtel he had the good fortune to attract the notice of Roullet de Mezerac, who enabled him by a timely loan to proceed to Rome. At Rome Robert soon struck the vein of subject destined to render his talent celebrated. In depicting the customs and life of the people, of southern Italy especially, he showed peculiar feeling for the historical characteristics of their race. All his work of this class was distinguished by an individual style: the actors bore themselves with an air of distinction and something of gravity which witnessed to their ancient lineage, and the rhythmical play of line which characterized all these compositions had a peculiar affinity to the nature of the types which figured in them. The charm of choice in these types, the beauty of this play of line, and the plastic restraint and measure which also marked Robert's treatment of his favourite subjects were the points to which he owed the wide recognition of his talent, for his command of his own powers was anything but ready and his difficulty in bringing out what he desired to produce shackled him, and especially so because painting requires a sure and ready hand if its means are to be used with brilliant effect. After executing many detached studies of Italian life Robert conceived the idea of painting four great works which should represent at one and the same time the four seasons in Italy and the four leading races of its people. In the Return from the Fête of the Madonna dell' Arco (Louvre) he depicted the Neapolitans and the spring. This picture, exhibited at the Salon of 1827, achieved undoubted success and was bought for the Luxembourg by Charles X.; but the work which appeared in 1831—the Summer Reapers arriving in the Pontine Marshes (Louvre), which became the property of Louis Philippe—established the artist's reputation, and Robert found himself with all his hopes of honour fulfilled and reckoned as one of the leading masters of his day. Florence and her autumn vineyards should now have furnished him with his third subject. He attempted to begin it, but, unable to conquer his unhappy passion for Princess Charlotte Napoleon (then mourning the violent death of her husband, Robert's devoted friend), he threw up his work and went to Venice, where he began and carried through the fourth of the series, the Fishers of the Adriatic. This work was not equal to the Reapers. Worn by the vicissitudes of painful feeling and bitterly discouraged, Robert committed suicide before his easel, 20th March 1835, on the tenth anniversary of the melancholy suicide of a brother to whom he had been much attached.

ROBERT OF GLOUCESTER, an English antiquary and historical writer, who lived in the second half of the 13th century, was a monk of the abbey at Gloucester, and is supposed by Hearne, the editor of his *Chronicle*, to have been sent to preside over the foundation at Oxford (afterwards Worcester College), where the younger members of the abbey were partly educated. This, however, is mere conjecture. The evidence which establishes his claim to be the author of the *Chronicle* (by which he is best known) is also extremely slight. In the Harleian MS. 201 (from which Hearne printed his edition) there occurs (fol. 159b

to 160) an account of the battle of Evesham. The narration implies that the writer was living at that time (1265), for he describes the dark and dismal weather that prevailed on the day of the battle, adding, "This isci Roberd, That verst this boc made,"—a passage, however, which may possibly have reference not to the versifier but to the original compiler of the *Chronicle*.¹ The period at which the *Chronicle* was composed was evidently late in the 13th or early in the 14th century, as it contains a reference to the canonization of St Louis, king of France, which took place on 11th August 1297. From an historical point of view, however, the *Chronicle* is of but little value. The internal evidence shows it to have been a translation from the French and the original in turn to have been a mere compilation. The narrative commences with a description of Britain, taken from Henry of Huntingdon; the material is next derived mainly from Geoffrey of Monmouth, and then, again, from William of Malmesbury, special information being supplied, here and there, from Henry of Huntingdon, Ailred of Rievaulx, and the Annals of Winchester.

On the other hand, the value of the *Chronicle* as an illustration of the versification and language of the period is considerable. As a writer of English verse Robert comes first in order, being prior to both Robert of Brunne and Laurence Minot, and he has accordingly been styled the Ennius of English literature. His diction, again, affords many interesting points of comparison with that known as Old English on the one hand and the language of Chaucer and William Tyndale on the other. In his verses we first find the term "Saxons" used in opposition to Normans (Hearne, p. 368), although "English" is the term by which, throughout the *Chronicle*, the original population is more generally designated. Of the English tongue itself, however, he says (*ib.*, p. 125) that "þe Saxones speche it was, and þow hem ycome yt ys." Many of the most noteworthy peculiarities of his diction will be found pointed out in Mr. Kingdon Oliphant's *Old and Middle English*, pp. 430-439.

Other compositions attributed to Robert of Gloucester are—a *Life* of St Alban in verse (MS. Ashmole, 43), a *Life* of St Patrick, also in verse (MS. Tanner, 17), a *Life* of St Bridget (MS. C.C.C. Camb., 145), and a *Life* of St Alphege (MS. Cott. Julius, D. ix.).

The only complete edition of the *Chronicle* is that edited by Thomas Hearne (Oxford, 1724), 2 vols. 8vo, partly from the Harleian MS. 201, and partly from the Cottonian MS. Calig. A. xi., and reprinted at London in 1810, 2 vols. 8vo. This, however, is extremely defective, Hearne's collation of the important MS. in the library of the college of Arms being very imperfect. For further information see Hardy's *Descriptive Catalogue of MSS.*, iii. 181-189, i. 25, 68, iii. 623.

ROBERT GUISCARD (c. 1015-1085), duke of Apulia and Calabria, sixth of the twelve sons of Tancred de Hauteville, was born at Hauteville near Coutances in Normandy about the year 1015. At an early age he followed into Apulia his three elder brothers William Brasdefer, Drogo, and Humphrey, who had established a footing there as military adventurers; and in 1053 he took a prominent part in the battle of Civitella, which resulted in the defeat and captivity of Pope Leo IX. On the death of Humphrey in 1057 Robert, who already had earned the sobriquet of "Guiscard" ("Sagacious" or "Cunning"), succeeded to the chief command of the Norman troops, and, already designated by them duke of Apulia and Calabria, was confirmed in that title in 1059 by Pope Nicholas II., who at the same time named him gonfalonier of the church. For the next one-and-twenty years he was continually engaged, along with his youngest brother Roger, in warlike operations against the Greeks and Saracens in the south of the Italian peninsula and in Sicily, the principal events being the capture of Bari in 1070, that of Palermo in the following year, and that of Salerno in 1077. In 1081 he felt himself strong enough to carry his arms abroad against Alexius Comnenus, ostensibly on behalf of the deposed emperor Michael Ducas, the father-in-law of his daughter. The defeat of Alexius under the walls of Durazzo in October 1081 was followed by the capture of that place in February 1082,

¹ There were others known by the same name; see Hearne, *Pref.*, p. 58.

and by a victorious march towards Constantinople. But before Robert had reached the capital he was summoned back by Gregory VII., his suzerain, to rescue him from the emperor Henry IV., by whom he was being besieged in Rome. After capturing and sacking the city in May 1084 and conducting Gregory to a place of safety in Salerno, Guiscard resumed his operations against Alexius, defeating the united Greek and Venetian fleets, and raising the siege of Corfu in November 1084. While still engaged in active warfare he died of pestilence at Cephalonia on 17th July 1085. He was succeeded in the dukedom by his younger son Roger Borsa, whose son William died without issue in 1127. Guiscard's eldest son was Marc BOHEMOND (q.v.).

ROBERTS, DAVID (1796-1864), landscape painter, was born at Stockbridge, Edinburgh, on 24th October 1796. At an early age he manifested a great love for art; but his father, a shoemaker, wished him to follow the same trade. He was, however, apprenticed for seven years to a painter and house-decorator; and during this time he employed his evenings in the earnest study of art. For the next few years his time was divided between work as a house-painter and as a scene-painter, and he even appeared occasionally on the boards as an actor in pantomimes. In 1820 he formed the acquaintance of Clarkson Stanfield, then painting at the Pantheon, Edinburgh, by whose advice and example he greatly profited and at whose suggestion he began his career as an exhibitor, sending three pictures in 1822 to the "Exhibition of Works by Living Artists," held in Edinburgh. In the same year he removed to London, where he worked for the Coburg Theatre, and was afterwards employed, along with Stanfield, at Drury Lane. In 1824 he exhibited at the British Institution a view of Dryburgh Abbey, and sent two works to the first exhibition of the Society of British Artists, which he had joined, and of which he was elected president in 1831. In the same autumn he visited Normandy, and the works which were the results of this excursion began to lay the foundation of the artist's reputation,—one of them, a view of Rouen Cathedral, being sold for eighty guineas. By his scenes for an opera entitled *The Seraglio*, executed two years later, he won much contemporary praise, and these, along with the scenery for a pantomime dealing with the naval victory of Navarino, and two panoramas executed jointly by him and Stanfield, were among his last work for the theatres. In 1829 he exhibited his imposing subject the Departure of the Israelites from Egypt, a commission from Lord Northwick, in which the style of the painter first becomes clearly apparent; and three years afterwards he travelled in Spain, and passed over to Tangiers, returning in the end of 1833 with a supply of effective sketches, which were speedily elaborated into attractive and popular paintings. His Interior of Seville Cathedral was exhibited in the British Institution in 1834, and sold for £300; and he executed a fine series of Spanish illustrations for the *Landscape Annual* of 1836, a publication to which he contributed for four years; while in 1837 a selection of his *Picturesque Sketches in Spain* was reproduced by lithography, many of the subjects being carefully retouched on the stone by the artist's own hand.

In 1838 Roberts made a long tour in the East, sailing up the Nile, visiting Luxor and Karnak, and afterwards making his way to the Holy Land. He thus accumulated a vast collection of sketches of a class of scenery which had hitherto been hardly touched by British artists, and which appealed to the public with all the charm of novelty. The next ten years of his life were mainly spent in elaborating these materials. Many Eastern subjects were painted, and an extensive series of drawings was lithographed by Louis Haghe in the superb work, *Sketches in the Holy*

Land and Syria, 1842-49. In 1851, and again in 1853, Roberts visited Italy, painting the Ducal Palace, Venice, bought by Lord Lonsborough, the interior of the Basilica of St Peter's, Rome, Christmas Day, 1853, and Rome from the Convent of St Onofrio, presented to the Royal Scottish Academy. His last volume of illustrations, *Italy, Classical, Historical, and Picturesque*, was published in 1859. He also executed, by command of the queen, a picture of the opening of the Great Exhibition of 1851,—a laborious and rather uncongenial task. In 1839 he was elected an associate, and in 1841 a full member of the Royal Academy; and in 1858 he was presented with the freedom of the city of Edinburgh. The last years of his life were occupied with a series of views of London from the Thames. He had executed six of these and was at work upon a picture of St Paul's Cathedral, when on 25th November 1864 he was seized with an attack of apoplexy and expired the same evening.

The quality of Roberts's work is exceedingly equal and uniform during his whole career. The architecture, which is so prominent a feature in his paintings, is introduced with great picturesqueness and an easy command of its salient points, but with little care for the minutiae of detail. His art was conventional, essentially scenic and spectacular in character, showing effective composition and an unerring instinct for broad general effect, but destitute of that close adherence to nature, that delicacy and truth of tone and colour, which are becoming increasingly characteristic of the productions of the English school. Something of the scene-painter appears in all his works, and his certainty and speed of execution were undoubtedly founded upon his early practice for the stage.

A *Life* of Roberts, compiled from his journals and other sources by James Ballantine, with etchings and pen-and-ink sketches by the artist, appeared in Edinburgh in 1866.

ROBERTSON, FREDERICK WILLIAM (1816-1853), one of the most brilliant and influential preachers of modern times, was born in London, on 3d February 1816. The first five years of his life were passed at Leith Fort, where his father, a captain in the Royal Artillery, was then resident. The impressions made upon the child in those early years were never effaced; the military spirit entered into his blood, and throughout life he was characterized by the qualities of the ideal soldier,—courage, self-devotion, sense of duty, hatred of cruelty and meanness, chivalrous defence of the weak. In 1821 Captain Robertson retired to Beverley, where the boy was educated first at home, then at the grammar-school. At the age of fourteen he spent a year at Tours, from which he returned to Scotland and continued his education at the Edinburgh Academy and university. His father, who had remarked and fostered his singular nobility of character, his passion for purity and truthfulness, and his deepening religious feeling, now proposed that he should choose the church as his profession, but received the decisive answer, "Anything but that; I am not fit for it." At the age of eighteen he was accordingly articled to a solicitor in Bury St Edmunds, but the uncongenial and sedentary employment broke down his health in a year's time. It was then resolved to yield to his deep-rooted craving for a military career: his name was placed upon the list of the 3d Dragoons then serving in India, and for two years he devoted himself with ardour to the work of preparing for the army. But, by a singular conjuncture of circumstances and at the sacrifice of his own natural bent to his father's wish, he matriculated at Brasenose College, Oxford, just two weeks before his commission was put into his hands. Oxford he did not find wholly congenial to his intensely earnest spirit, but he read hard, and, as he afterwards said, "Plato, Aristotle, Butler, Thucydides, Sterne, Jonathan Edwards, passed like the iron atoms of the blood into my mental constitution." At the same time he made a careful study of the Bible, committing to memory the entire New Testament both in English and in Greek. The Tractarian movement had no attraction for him, although he admired some of its

leaders. He was at this time a moderate Calvinist in doctrine and enthusiastically evangelical. Ordained in July 1840 by the bishop of Winchester, he at once entered on ministerial work in that city, and during his ministry there and under the influence of Martyn and Brainerd, whose lives he affectionately studied, he carried devotional asceticism to an injurious length, rising early, refraining from meat, subduing his nature by self-imposed austerities, and binding himself to a system of prayer. In less than a year he was compelled to seek relaxation; and going to Switzerland he there met and married Helen, third daughter of Sir George William Denys, Bart. Early in 1842, after a few months' rest, he accepted a curacy in Cheltenham, which he retained for upwards of four years. "It was during this period that the basis of his theological science was entirely changed; his principles of thought attained, but not as yet systematized; his system of interpreting the Bible reduced to order; his whole view of the relation of God to man and man to God built up into a new temple on the ruins of the old." The questioning spirit was first aroused in him by the disappointing fruit of evangelical doctrine which he found in Cheltenham, as well as by intimacy with men of varied reading. But, if we are to judge from his own statement, the doubts which now actively assailed him had long been latent in his mind: "a man who had read theological and philosophical controversy long before with painful interest—a man who at different times had lived in the atmosphere of thought in which Jonathan Edwards, Plato, Lucretius, Thomas Brown, Carlyle, Emerson, and Fichte lived—who has steeped his soul and memory in Byron's strongest feelings—who has walked with Newman years ago to the brink of an awful precipice, and chosen rather to look upon it calmly, and know the worst of the secrets of the darkness, than recoil with Newman, in fear and tenderness, back to the infallibility of Romanism—such a man is not likely to have been influenced by a few casual statements of difficulties which he had read of a thousand times before." This was written from Heidelberg in 1846. The crisis of his mental conflict had just been passed in Tyrol, and he was now beginning to let his creed grow again from the one fixed point which nothing had availed to shift: "the one great certainty to which, in the midst of the darkest doubt, I never ceased to cling—the entire symmetry and loveliness and the unequalled nobleness of the humanity of the Son of Man." After this mental revolution he felt unable to return to Cheltenham, but after doing duty for two months at St Ebbe's, Oxford, he entered in August 1847 on his famous ministry at Trinity Chapel, Brighton. Here he stepped at once into the foremost rank as a preacher. His church was thronged with thoughtful men of all classes in society and of all shades of religious belief, with those also who relished brilliant and sometimes impassioned oratory, and with those who felt their need of sympathetic and helpful teaching. But his closing years were full of sadness. His sensitive nature was subjected to extreme suffering, partly from the misconstruction and hatred of the society in which he lived, partly from his inability to accomplish the heavy work of his position. He was crippled by incipient disease of the brain, which at first inflicted unconquerable lassitude and depression, and latterly agonizing pain. On the 5th June 1853 he preached for the last time; and on the 15th August of the same year, at the age of thirty-seven, he found relief in death.

The causes of his success as a preacher are obvious. His fine appearance, his flexible and sympathetic voice, his manifest sincerity, the perfect lucidity and artistic symmetry of his address, and the brilliance with which he illustrated his points would have attracted hearers even had he had little to say. But he had much to say. No sermons were ever more compact. They were the utterance of a

full, vivid, and penetrating mind. He was not, indeed, a scientific theologian; but his insight into the principles of the spiritual life is unrivalled; and for men approaching the truth from the same side as himself he is an invaluable guide. His own lonely and independent struggle had taught him where foothold was secure, and had enabled him to throw light on many a forgotten stepping-stone of truth. As his biographer says, thousands have found in his sermons "a living source of impulse, a practical direction of thought, a key to many of the problems of theology, and above all a path to spiritual freedom." In his hands spiritual facts assume an aspect of reasonableness which is irresistible. Religion is felt to be no longer a mystery for the exercise of professional minds, nor an extravagance suitable for enthusiastic temperaments, but an essential of life for all, and in line with the order of things in which we now are. For his sermons obtained their large circulation partly because they were new in kind. They marked the transition from the period in which religion was treated as a series of propositions to that in which it is presented as an essence penetrating the whole of human life. The accusations of heretical and dangerous teaching which were persistently brought against him, though possibly not so malignant as he himself supposed, were certainly more mischievous than the teaching against which they were levelled. Few men have ever more perfectly understood the spirit of Christ, and few have so fully made that spirit their own.

Robertson's literary remains include five volumes of sermons, two volumes of expository lectures, on Genesis and on the Epistles to the Corinthians, a volume of miscellaneous addresses, and a *Key to 'In Memoriam.'* Robertson's *Life* has been written by Stopford A. Brooke. (M. D.)

ROBERTSON, THOMAS WILLIAM (1829-1871), English dramatist, was born on 9th January 1829. As a dramatist he had a brief but very brilliant career. It is not too much to say that he was the most successful and distinguished writer of plays in his generation. The son of a provincial actor and manager, chief of a "circuit" that ranged from Bristol to Cambridge, Robertson was familiar with the stage from his childhood; but it was not till the last seven years of his life that he made his mark. He was never, as he admitted himself, very successful as an actor. He tried his hand also at writing plays, and a farcical comedy by him, *A Night's Adventure*, was produced at the Olympic under Farren's management as early as 1851. But this did not make good his footing, and he remained for some years longer in the provinces, varying his work as an actor with miscellaneous contributions to newspapers. In 1860 he went to London with the intention, it is said, of making his living by journalism and light literature. He edited a mining journal and contributed to it a novel afterwards dramatized with the title *Shadow Tree Shaft*. He wrote a farce entitled *A Cantab*, which was played at the Strand in 1861. Then, in 1864, came his first marked success, *David Garrick*, produced at the Haymarket with Sothorn in the principal character. It was not, however, till the production of *Society* at the Prince of Wales Theatre in 1865, under the management of Miss Marie Wilton, afterwards Mrs Bancroft, that the originality and cleverness of the dramatist were fully recognized. Play-writer and company were exactly suited one to another; the plays and the acting together—the small size of the playhouse being also in their favour—were at once recognized as a new thing, and, while some critics sneered at the "cup-and-saucer comedy," voted it absurdly realistic, said there was nothing in it but commonplace life represented without a trace of Sheridanian wit and sparkle, all London flocked to the little house in Tottenham Street, and the stage was at once inundated with imitations of the new style of acting and the new kind of play.

Robertson, although his health was already undermined, followed up *Society* in quick succession with the series of characteristic plays which made the reputation of himself, the company, and the theatre. *Ours* was produced in 1866, *Caste* in 1867, *Play* in 1868, *School* in 1869, *M.P.* in 1870. For twenty years there probably has not been a week, hardly a night, in which some one of Robertson's plays has not been produced somewhere in Great Britain,

and still they show no sign of abating popularity. The masterly stage-craft is undoubtedly one of the elements in this remarkable conquest of the play-going public; the purity and generous morality of the plays another; the dialogue—which is always bright and clever, without any straining after or indeed much attaining to wit—a third; the humour, distinctness, and typical representativeness of the characters a fourth. That there is more art and individuality in the plays than critics at first were willing to admit is clear from the fact that none of Robertson's numerous imitators have succeeded in catching his happy knack. Another proof of something like genius—dramatic genius if not literary genius—is the skill with which he repeats the same idea with such variations that each time it is as fresh as if it were new. Again and again his situations owe their point to the contrast between generous kindness of heart and sordid worldliness, or between the ardent trustful affections of youth and the cynicism of disenchanted middle age. Pleasant sunny brightness and ingenuity within a narrow range constitute Robertson's distinction rather than breadth or fertility or striking brilliancy of wit. He knew his powers and worked steadily within them, not striving to go beyond. With the exception of *David Garrick and Home*, written for the Haymarket, and *Dreams* for the Gaiety, all his well-known plays were written for the Prince of Wales Theatre, with which his distinctive style of comedy is identified. Unhappily he did not live long to enjoy his success, but died in London in February 1871.

ROBERTSON, WILLIAM (1721-1793), an eminent Scottish historian, born at Borthwick, Midlothian, on the 19th September 1721, was the eldest son of the Rev. William Robertson and of Eleanor Pitcairn. He received his early education at the school of Dalkeith,—at that time one of the best in Scotland; but at the age of twelve he was removed to the university of Edinburgh, where he soon manifested that sustained ardour in the pursuit of knowledge which he preserved throughout his long life. On his commonplace books, written when he was a mere youth, he always inscribed the motto: *Vita sine literis mors est*. He was from the first intended for the ministry; when twenty-two years old he was presented to the living of Gladsmuir in East Lothian, and almost immediately afterwards he lost both his father and his mother, who died within a few hours of each other. The support and education of a younger brother and six sisters then devolved upon him, and, though his income was only £100 a year, he sheltered them all in his house and “continued to educate his sisters under his own roof till they were settled respectably in the world” (Stewart). Robertson's inclination for study was never allowed to interfere with his duties as a parish minister, which he rather increased than diminished: “it was his custom during the summer months to convene on Sunday morning the youth of the parish of Gladsmuir half an hour before the commencement of the regular service of the church, and to employ that time in explaining to them the doctrines of the Catechism.” His attention to his pastoral duties and his power and distinction as a preacher had made him a local celebrity while still a young man.

His energy and decision of character were brought out vividly by the rebellion of 1745. When Edinburgh seemed in danger of falling into the hands of the rebels he laid aside the pacific habits of his profession and joined the volunteers in the capital. When the city was surrendered he was one of the small band who repaired to Haddington and offered their services to the commander of the royal forces. Such a man could not remain in obscurity, and in the year 1751, when not quite thirty years of age, we find him already taking a prominent part

in the business of the General Assembly. On the first occasion when he spoke (in seconding a motion by John Home for the suspension of certain presbyters who had refused to take part in an unpopular settlement) he was listened to with great attention, but his words had so little immediate effect on the assembly that on a division he was left in a minority of eleven against two hundred. A young man might well have been daunted by such a defeat, but his energy and self-reliance refused to yield. His great oratorical power, at once lucid, cogent, and persuasive, had made an impression on men's minds, and within so short a period as one year, when he again advocated his principles in connexion with what is known as the Inverkeithing case, he carried the house completely with him, and with the deposition of Thomas Gillespie secured a triumph for the policy he had adopted. From that moment his influence in the councils of the Scottish Church as leader of the “moderate party” was for many years nearly supreme (compare *PRESBYTERIANISM*, vol. xix. p. 685). The production of Home's tragedy of *Douglas* on the Edinburgh stage (1757) afforded Robertson another occasion for displaying that union of courage and caution which formed a marked feature of his character. Although the influence of moderatism was now visibly in the ascendant, there was still enough of the older spirit of Scottish Puritanism left to take alarm and raise an outcry against a stage play written by a minister and witnessed by many clergymen who were the author's friends. One of these, the famous Dr Alexander Carlyle, was prosecuted before the synod for having gone to the theatre, and he tells us in his *Autobiography* that he purposely contrived to exclude Robertson from the post of moderator because “his speaking would be of more consequence if not in the chair.” This testimony is the more noteworthy as Carlyle shows throughout his memoirs a grudging and unfriendly tone when speaking of Robertson. The latter, indeed, was able to render his incriminated colleague great service on this occasion, not only by his talent as a speaker, but by reason of the detached and unassailable position which his customary prudence had led him to take up. He never went to the play himself, he said, but that was not because he thought it wrong but because he had given a solemn promise to his father never to do so. He could not therefore join in censuring other clergymen who were held by no such vow as he had made: “it was sacred to him, but not obligatory on them.” Carlyle was acquitted and Robertson had the credit—which he perhaps somewhat too constantly aimed at and generally secured—of standing well with all parties, of advocating the claims of culture and liberal sentiment without giving ground to their opponents for attacking his personal conduct and character.

But during all this period of prominent activity in the public life of Edinburgh Robertson was busy with those historical labours which have given him a permanent place in British literature. He had conceived the plan of his *History of Scotland* as early as the year 1753; in July 1757 he had proceeded as far as the Gowrie conspiracy, and in November of the following year David Hume, then residing in London, was receiving the proof-sheets from Strahan and making friendly but searching criticisms on the work in letters to the author. Till he had finished his book Robertson had never left his native country; but the publication of his history necessitated a journey to London, and he passed the early months of the year 1758 partly in the capital and partly in leisurely rambles in the counties of England. He returned on horseback in company with Alexander Carlyle and other Scotsmen, riding all the way from London to Edinburgh in about eighteen days.

The success of the *History of Scotland* was immediate and splendid, and within a month a second edition was

called for. Before the end of the author's life the book had reached its fourteenth edition; and in the opinion of some it remains Robertson's greatest work. It soon brought him other rewards than literary fame. In 1759 he was appointed chaplain of Stirling Castle, in 1761 one of His Majesty's chaplains in ordinary, and in 1762 he was chosen principal of the university of Edinburgh. Two years later the office of king's historiographer was revived in his favour with a salary of £200 a year. His income greatly surpassed the revenue of any Presbyterian minister before him and at least equalled that of some of the bishops when Episcopacy was established in Scotland. It is the more surprising therefore that this moment of exceptional prosperity should have been chosen by some of his most valued friends to advise him to forsake the Scottish for the English Church and try for preferment south of the Tweed; and the surprise becomes wonder when we learn that those friends were Sir Gilbert Elliot and David Hume. The imprudence, to say nothing of the questionable morality, of such a step would seem too glaring to allow of its recommendation by any honourable well-wishers. Perhaps no man was more fitted than Robertson to measure and reject such injudicious advice, and he probably never gave the matter a second thought. He remained at home among his own people.

The rest of Robertson's life was uneventful to a degree even surpassing the proverbial uneventfulness of the lives of scholars. He was casting about for another historical subject in the very year in which his first work appeared, and he was wont to consult his friends on the choice of a period with a naiveté which shows how little the arduousness of historical research was then understood. Hume advised him to write a history of Greece or else lives in the manner of Plutarch. Dr John Blair urged him to write a complete history of England, while Horace Walpole suggested a history of learning. It must be recorded to Robertson's credit that he showed a preference from the first for the subject which he ultimately selected, *The History of the Reign of the Emperor Charles the Fifth*. He took uncommon pains with the work and devoted to it ten consecutive years of labour. It appeared in three volumes quarto in 1769. In 1777 he published his *History of America* and in 1791 his *Disquisition concerning the Knowledge which the Ancients had of India*, which concluded his historical labours and appeared only two years before his death, which occurred near Edinburgh on the 11th June 1793. His fame had long been European, and he left no rival in the field of historical composition save Gibbon alone.

For an adequate appreciation of Robertson's position in British literature, and more especially of his rank as an historian, we have to consider the country and the age in which he was born and his own personal qualities and limits.

Considering the small size and poverty of the country, Scotland had made a more than creditable figure in literature in the great age of the Reformation and the Renaissance. Its scholars, civilians, and professors of logic and philosophy were welcomed wherever learning flourished, except, perhaps, in England. All Europe could not show a more brilliant writer and publicist than Buchanan, and "the best romance that ever was written" (the words are Cowper's) was produced by a Scottish contemporary of Shakespeare, viz., the once famous *Argenis* of John Barclay. But the early triumphs of Scottish genius were all won in a foreign if familiar idiom, the common language of the learned; and when Latin retreated before the growing importance of modern tongues the Scots had no literary vernacular on which to fall back. For a century and a half (1600-1750) a Scottish writer to be read was forced to

use a foreign language,—Latin, English, and even occasionally French. As Burton¹ has well remarked, this alone was sufficient to account in a large measure for the literary barrenness of the country. There was unquestionably another cause at work,—the fervent religious zeal with which the principles of the Reformation had been embraced: neither science, literature, nor art could obtain much attention from men who regarded them all as "deceitful vanities," leading the mind away from the one thing needful. In a small and sparsely peopled country, without wealth, commerce, or even politics in the larger sense, theology became a too absorbing and unique mental stimulus. This was, we may say, proved by the fact that as soon as the union with England opened a wider scope for Scottish energy and enterprise the theological temperature immediately fell,—a change witnessed with natural alarm by the more zealous clergy. "The rise of our too great fondness for trade," writes the Rev. Robert Wodrow in 1709, "to the neglect of our more valuable interests, I humbly think, will be written on our judgment" (Buckle, vol. ii. p. 301). The growth of wealth stimulated the growth of the other great factor of civilization, that of knowledge, and by the middle of the 18th century, just at the time when Robertson was planning his *History of Scotland*, a wide spirit of inquiry was abroad. Scottish intellect had risen from the tomb in which it had lain entranced for more than a hundred years. The Scottish contribution to British literature in the last half of the century is distinctly superior to that produced in the southern portion of the island. In philosophy and political and economic science the balance is immensely in favour of Scotland. Robertson was therefore no inexplicable prodigy—an "obscure Scotch parson" writing "like a minister of state," as it pleased Walpole and the London fops to regard him. He lived in a society far more propitious to high literary work than could be found in London or the English universities.

The connexion between philosophy and history is closer than appears at first sight. The study of man and his faculties, even ontological speculations as to the nature and origin of the universe, lead by a logical sequence to a consideration of human evolution in time, that is, to history. The coincidence of philosophical speculation with historical achievement so repeatedly manifested cannot be accidental. The topic cannot be developed here; but from the days of the Attic historians, who lived in an atmosphere electric with speculation, to the Hegelian historical school of Germany, the higher planes of history are found in near proximity to loftier peaks of philosophy. Hume, wonderful in all things, was perhaps most wonderful in this, that in him the two characters of the philosopher and the historian were completely united. He did not only, like Kant and Hegel, speculate about history; he wrote it. Again, we must admire the peculiar fortune of Robertson: he lived during many years in close contact and intimacy with the greatest philosophic genius of his age, perhaps of modern times.

Of the three great British historians of the 18th century two were Scotsmen. The exact place of Robertson with regard to his two friends Hume and Gibbon, and to such historians as the rest of Europe had to offer, presents a question of some nicety, because it is complicated by extraneous considerations, so to speak, which should not weigh in an abstract estimate, but cannot be excluded in a concrete and practical one. If we regard only Robertson's potential historic power, the question is not so much whether he was equal to either of his two friends as whether he was not superior to both. The man who wrote the review of the state of Europe prefixed to the

¹ *Hist. of Scotland*, vol. viii. p. 544.

History of Charles V., or even the first book of the *History of Scotland*, showed that he had a wider and more synthetic conception of history than either the author of the *Decline and Fall* or the author of the *History of England*. These two portions of Robertson's work, with all their shortcomings in the eye of modern criticism, have a distinctive value which time cannot take away. He was one of the first to see the importance of *general ideas* in history. He saw that the immediate narrative of events with which he was occupied needed a background of broad and connected generalizations, referring to the social state of which the detailed history formed a part. But he did more than this. In the appendix to the view of Europe called "Proofs and Illustrations" he enters into the difficult and obscure question of land tenure in Frankish times, and of the origin of the feudal system, with a sagacity and knowledge which distinctly advanced the comprehension of this period beyond the point at which it had been left by Du Bos, Montesquieu, and Mably. He was fully acquainted with the original documents,—many of them, we may conjecture, not easy to procure in Scotland. It must have been a genuine aptitude for historical research of a scientific kind which led Robertson to undertake the labour of these austere disquisitions of which there were not many in his day who saw the importance. Gibbon, so superior to him for wide reading and scholarship, has pointedly avoided them. It need hardly be said that many, perhaps the majority, of Robertson's views on this thorny topic are out of date now. But he deserves the honour of a pioneer in one of the most obscure if also important lines of inquiry connected with European history. On the other hand, it must be admitted that he showed himself only too tame a follower of Voltaire in his general appreciation of the Middle Ages, which he regarded with the mingled ignorance and prejudice common in the 18th century. In this particular he was not at all in advance of his age.

The neglect and gradual oblivion which are now overtaking the greater part of Robertson's historical work are owing to no fault of his. He had not and could not have the requisite materials: they were not published or accessible. Justice requires that we should estimate his performance in view of the means at his command, and few critics would hesitate to subscribe to the verdict of Buckle, "that what he effected with his materials was wonderful." His style, whether of narrative or disquisition, is singularly clear, harmonious, and persuasive. The most serious reproach made against it is that it is correct to a fault and lacks idiomatic vigour, and the charge is not without foundation. But there can be no doubt that, if Robertson's writings are less read than they formerly were, the fact is to be attributed to no defects of style but to the growth of knowledge and to the immense extension of historical research which has inevitably superseded his initiatory and meritorious labours. (J. C. MO.)

ROBERVAL, GILLES PERSONNE DE (1602-1675), French mathematician, was born at the village of Roberval near Beauvais in 1602. His name was originally Gilles Personne, that of Roberval, by which he is known, being taken from the place of his birth. Like Descartes, he was present at the siege of La Rochelle in 1627. In the same year he went to Paris, where he was appointed to the chair of philosophy in the Gervais College in 1631, and afterwards to the chair of mathematics in the Royal College of France. A condition of tenure attached to this chair was that the holder should propose mathematical questions for solution, and should resign in favour of any person who solved them better than himself; but, notwithstanding this, Roberval was able to keep the chair till his death, which occurred at Paris in 1675.

Roberval was one of those mathematicians who, just before the invention of the calculus, occupied their attention with problems which are only soluble, or can be most easily solved, by some method involving limits or infinitesimals, and in the solution of which accordingly the calculus is always now employed. Thus he devoted some attention to the quadrature of curves and the cubature of surfaces, which he accomplished, in some of the simpler cases, by a method of his own, called by himself the "Method of Indivisibles"; but he lost much of the credit of the discovery as he kept his method for his own use, while Cavalieri published a similar method of his own. Another of Roberval's discoveries was a very general method of drawing tangents, by considering a curve as described by a moving point whose motion is the resultant of several simpler motions. His own description of his method may be translated as follows:—"General rule. By means of the specific properties of the curve, which will be given, examine the different motions of the tracing point at the place where you wish to draw the tangent; the direction of the tangent is that of the resultant of these motions." He also discovered a method of deriving one curve from another, by means of which finite areas can be obtained equal to the areas between certain curves and their asymptotes. To these curves, which were also applied to effect some quadratures, Torricelli gave the name of Robervallian lines. Between Roberval and Descartes there existed a feeling of ill-will, owing to the jealousy aroused in the mind of the former by the criticism which Descartes offered to some of the methods employed by him and by Fermat; and this led him to criticize and oppose the new geometry which Descartes introduced about this time. As results of Roberval's labours outside the department of pure mathematics may be noted a work on the system of the universe, in which he supports the Copernican system and attributes a mutual attraction to all particles of matter; and also the invention of a special kind of balance which goes by his name (see BALANCE, vol. iii. p. 266).

ROBESPIERRE, MAXIMILIEN MARIE ISIDORE (1758-1794), the most fanatical and most famous of the republican leaders of the French Revolution, was born at Arras on 6th May 1758. His family was of Irish descent, having emigrated from Ireland at the time of the Reformation on account of religion, and his direct ancestors in the male line had been notaries at the little village of Carvin near Arras from the beginning of the 17th century. His grandfather, being more ambitious, established himself at Arras as an avocat; and his father followed the same profession, marrying Mademoiselle Josephine Carraut, daughter of a brewer in the same city, in 1757. Of this marriage four children were born, two sons and two daughters, of whom Maximilien was the eldest; but in 1767 Madame Derobespierre, as the name was then spelt, died, and the disconsolate widower at once left Arras and wandered about Europe until his death at Munich in 1769. The children were taken charge of by their maternal grandfather and aunts, and Maximilien was sent to the college of Arras, whence he was nominated in 1770 by the bishop of his native town to a bursarship at the Collège Louis-le-Grand at Paris. Here he had for fellow-pupils Camille Desmoulins and Stanislas Fréron. Completing his law studies with distinction, and having been admitted an avocat in 1781, Robespierre returned to his native city to seek for practice, and to struggle against poverty. His reputation had already preceded him, and the bishop of Arras, M. de Conzié, appointed him criminal judge in the diocese of Arras in March 1782. This appointment, which he soon resigned, to avoid pronouncing a sentence of death, did not prevent his practising at the bar, and he speedily became known as a careful and painstaking advocate. His argument in the question of the legality of paratonnerres or lightning-conductors, which was widely reported and translated into both English and German, raised his fame as an advocate to its height, and with this success his struggles against poverty were over. He now turned to the pleasures of literature and society and came to be esteemed as one of the best writers and most popular dandies of Arras. In December 1783 he was elected a member of the academy of Arras, whose meetings he attended regularly; and, like all other young Frenchmen with literary proclivities, he began to compete for the

prizes offered by various provincial academies. In 1784 he obtained a medal from the academy of Metz for his essay on the question whether the relatives of a condemned criminal should also be punished; but the prize was awarded to Lacretelle aîné, an avocat and journalist at Paris, who triumphed again over his provincial antagonist in the Parisian press, and who in after days when Robespierre was all-powerful was surprised that he was not sent to the guillotine. An éloge on Gresset, the author of *Vert-Vert* and *Le Méchant*, written for the academy of Amiens in 1785, was not more successful; but Robespierre was compensated for these failures by his great popularity in the society of the Rosati at Arras,—a little society whose members prided themselves on being men of fashion and wit, and spent one evening a week in conviviality and in reading poems, epigrams, and vers de société. There the sympathetic quality of Robespierre's voice, which afterwards did him such good service in the Jacobin Club, always caused his indifferent verses to be loudly applauded by his friends.

Such had been the life of the future republican leader up to 1788, when he took part in the discussion as to the way in which the states-general should be elected, showing clearly and forcibly in his *Adresse à la Nation Artésienne* that, if the former mode of election by the members of the provincial estates was again adopted, the new states-general would not represent the people of France. Necker also perceived this, and therefore determined to make the old royal bailliages and sénéchaussées the units of election. Under this plan the city of Arras was to return twenty-four members to the assembly of the bailliage of Artois, which was to elect the deputies. The corporation claimed the right to a preponderating influence in these city elections, and Robespierre headed the opposition, making himself very conspicuous and drawing up the cahier or table of complaints and grievances, for the guild of the cobblers. Although the leading members of the corporation were elected, their chief opponent succeeded in getting elected with them. In the assembly of the bailliage rivalry ran still higher, but Robespierre had already made his mark in politics; by the *Avis aux Habitants de Campagne* (Arras, 1789), which is almost certainly by him, he secured the support of the country electors, and, though but thirty years of age, poor, and without influence, he was elected fifth deputy of the tiers état of Artois to the states-general.

When the states-general met at Versailles on 5th May 1789, the young deputy of Artois already possessed the one faculty which was to lead him to supremacy: he was a fanatic. As Mirabeau said, "That young man believes what he says; he will go far." Without the courage and wide tolerance which make a statesman, without the greatest qualities of an orator, without the belief in himself which marks a great man, nervous, timid, and suspicious, Robespierre yet believed in the doctrines of Rousseau with all his heart, and would have gone to death for them; and in the belief that they would eventually succeed and regenerate France and mankind he was ready to work with unwearied patience. While the constituent assembly occupied itself in drawing up an unworkable constitution as the grand panacea, Robespierre turned from the assembly of provincial avocats and wealthy bourgeois to the people of Paris. However, he spoke frequently in the constituent assembly, and often with great success, and was eventually recognized as second only to Pétion de Villeneuve—if second to him—as a leader of the small body of the extreme left,—the thirty voices, as Mirabeau contemptuously called them. It is hardly necessary to examine minutely Robespierre's speeches and behaviour before 1791, when the death of Mirabeau left the way clear for the influence of his party; but what is noteworthy, as proving the religious cast of his mind and his belief in the

necessity of a religion, is that he spoke several times in favour of the lower clergy and laboured to get their pensions increased. When he instinctively felt that his doctrines would have no success in the assembly, he turned to the Jacobin Club, which had consisted originally of the Breton deputies only, but which, after the assembly moved to Paris, began to admit among its members various leaders of the Parisian bourgeoisie. As time went on, many of the more intelligent artisans and petits commerçants became members of the club, and among such men Robespierre found the hearers he sought. They did more than listen to him: they idolized him; the fanatical leader had found fanatics to follow him, and their ultimate supremacy became merely a question of time. As the wealthier bourgeois of Paris and deputies of a more moderate type seceded to the club of '89 the influence of the old leaders of the Jacobins (Barnave, Duport, Charles de Lameth) diminished; and, when they themselves, alarmed at the progress of the Revolution, founded the club of the Feuillants in 1791, the followers of Robespierre dominated the Jacobin Club. The death of Mirabeau strengthened Robespierre's influence in the assembly; but in May 1791 he proved his lack of statesmanlike insight and his jealous suspicion of his colleagues by proposing and carrying the motion that no deputies who sat in the constituent could sit in the succeeding assembly. The flight of the king on 21st June and his arrest at Varennes excited Robespierre's suspicions, and made him declare himself at the Jacobin Club to be "ni monarchiste ni republicain." But the vigorous conduct of Lafayette and the National Guard on the Champ de Mars on 17th July 1791 terrified him, for he believed that he was a predestined victim, until he was succoured by Duplay, a cabinetmaker in the Rue St Honoré, and an ardent admirer of his, in whose house he lived (with but two short intervals) till his death. At last came his day of triumph, when on 30th September, on the dissolution of the constituent assembly, the people of Paris crowned Pétion and himself as the two incorruptible patriots.

On the dissolution of the assembly he returned for a short visit to Arras, where he met with a triumphant reception. In November he returned to Paris, and on 18th December made a speech which marks a new epoch in his life. Brissot, the *âme politique* of the Girondin party which had been formed in the legislative assembly, urged vehemently that war should be declared against Austria, and the queen was equally urgent in the hope that a victorious army might restore the old absolutism of the Bourbons. Two men opposed the projects of the queen and the Girondins,—Marat and Robespierre: Marat opposed them for statesmanlike reasons (see MARAT), and Robespierre on humanitarian grounds and because as a follower of Rousseau he disliked war. This opposition from those whom they had expected to aid them irritated the Girondins greatly, and from that moment began the struggle which ended in the *coups d'état* of 31st May and 2d June 1793. Guadet accused Robespierre of superstition in believing in a providence, and declared that, as the people's idol, he ought to ostracize himself for the good of his country. Robespierre persisted in his opposition to the war, and the Girondins, especially Brissot, attacked him so violently that in April 1792 he resigned the post of public prosecutor at the tribunal of Paris, which he had held since February, and started a journal, *Le Défenseur de la Constitution*, in his own defence. It is noteworthy that during the summer months of 1792, in which the fate of the Bourbon dynasty was being sealed, neither the Girondins in the legislative assembly nor Robespierre took any active part in overthrowing it. Stronger men with practical instincts of statesmanship, like Danton and

Billaud-Varenne, who were not afraid of blood, and who dared to look facts in the face and take the responsibility of doing while others were talking, were the men who made the 10th of August and took the Tuileries. The Girondins, however, were quite ready to take advantage of the accomplished fact; and Robespierre, likewise, though shocked at the shedding of blood, was willing to take his seat on the commune of Paris, which had overthrown Louis XVI., and might check the Girondins. The strong men of the commune were glad to have Robespierre's assistance, not because they cared for him or believed in him, but because of the help got from his popularity, his reputation for virtue, and his influence over the Jacobin Club and its branches, which spread all over France. He it was who presented the petition of the commune of Paris on 16th August to the legislative assembly, demanding the establishment of a revolutionary tribunal and the summons of a convention. The massacres of September in the prisons, which Robespierre in vain attempted to stop, showed that the commune had more confidence in Billaud than in him. Yet, as a proof of his personal popularity, he was a few days later elected first deputy for Paris to the national convention.

On the meeting of the convention the Girondins immediately attacked Robespierre; they were jealous of his popularity and knew that his single-hearted fanaticism would never forgive their intrigues with the king at the end of July, and would always be opposed to their plans for raising the duke of Orleans to the throne. As early as 26th September the Girondin Lasource accused him of aiming at the dictatorship; afterwards he was informed that Marat, Danton, and himself were plotting to become triumvirs; and eventually on 29th October Louvet attacked him in a studied and declamatory harangue, abounding in ridiculous falsehoods and obviously concocted in Madame Roland's boudoir. But Robespierre had no difficulty in rebutting this attack (5th November). All personal disputes, however, gave way by the month of December 1792 before the great question of the king's trial, and here Robespierre took up a position which is at least easily understood. These are his words spoken on 3d December: "This is no trial; Louis is not a prisoner at the bar; you are not judges; you are—you cannot but be statesmen, and the representatives of the nation. You have not to pass sentence for or against a single man, but you have to take a resolution on a question of the public safety, and to decide a question of national foresight. It is with regret that I pronounce the fatal truth; Louis ought to perish rather than a hundred thousand virtuous citizens; Louis must die, that the country may live." This great question settled by the king's execution, the struggle between Robespierre and the Girondins entered upon a more acute stage, and the want of statesmanship among the latter threw upon the side of the fanatical Robespierre Danton and all those strong practical men who cared little for personal questions, and whose only desire was the victory of France in her great struggle with Europe. Had it been at all possible to act with that group of men of genius whom history calls the Girondins, Danton, Carnot, Robert Lindet, and even Billaud-Varenne would have sooner thrown in their lot with them than with Robespierre, whom they thoroughly understood; but the Girondins, spurred on by Madame Roland, refused to have anything to do with Danton. Government became impossible; the federalist idea, which would have broken France to pieces in the very face of the enemy, grew and flourished, and the men of action had to take a decided part. In the month of May 1793 Camille Desmoulins, acting under the inspiration of Robespierre and Danton, published his *Histoire des Brissotins* and *Brissot dévoilé*;

Isnard declared that Paris must be destroyed; Robespierre preached insurrection at the Jacobin Club; and on 31st May and 2d June the commune of Paris destroyed the Girondin party. For a moment it seemed as if France would avenge them; but patriotism was stronger than federalism. The defence of Lyons only exasperated the men who were working for France, and the armies who were fighting for her, and on 27th July 1793, when the struggle was practically decided, the convention elected Robespierre to the committee of public safety.

This election marks an important epoch, not only in the life of Robespierre, but in the history of the Revolution. Danton and the men of action had throughout the last two years of the crisis, as Mirabeau had in the first two years, seen that the one great need of France, if she was to see the end of her troubles without the interference of foreign armies, was the existence of a strong executive government. The means for establishing the much-needed strong executive were found in the committee of public safety. The success of this committee in suppressing the Norman insurrection had confirmed the majority of the convention in the expediency of strengthening its powers, and the committee of general security which sat beside it was also strengthened and given the entire management of the internal police of the country. When Danton, who had been a member of the committee from April to 10th July 1793, left it Robespierre was elected; and it was not until then that he became one of the actual rulers of France. Indeed the committee was not finally constituted until the 13th of September, when the last two of the "great" twelve who held office until July 1794 were elected. Of these twelve at least seven, Carnot, Billaud-Varenne, Collot d'Herbois, Prieur (of the Marne), Prieur (of the Côte d'Or), Jean Bon Saint-André, and Robert Lindet, were essentially men of action, all of whom despised rather than feared Robespierre owing to his supposed timidity, and were entirely free from his influence. Of the other four Héault de Séchelles was a professed adherent of Danton; Barère was an eloquent Provençal, who was ready to be the spokesman to the convention of any view which the majority of the committee might adopt; and only Couthon and Saint-Just shared Robespierre's political enthusiasm for the regeneration of France by the gospel of Rousseau. It is necessary to dwell upon the fact that Robespierre was always in a minority in the great committee in order to absolve him from the blame of being the inventor of the enormities of the Terror, as well as to deprive him of the glory of the gallant stand made against Europe in arms.

After this examination of Robespierre's position it is not necessary to investigate closely every act of the great committee during the year which was pre-eminently the year of the Terror; the biographer is rather called upon to examine his personal position with regard to the establishment of the Terror and the fall of the Hébertists and Dantonists, and then to dwell upon the last three months in which he stood almost alone trying to work up an effective counterbalance to the power of the majority of the great committee. The Terror was the embodiment of the idea of Danton, that it was necessary to have resort to extreme measures to keep France united and strong at home in order to meet successfully her enemies upon the frontier. This idea was systematized by the committee of public safety, or rather by two members of it acting for the majority, Billaud-Varenne and Collot d'Herbois, without much consideration as to who were to be the victims. With the actual organization of the Terror Robespierre had little or nothing to do; its two great engines, the revolutionary tribunal and the absolute power in the provinces of the representatives on mission, were in existence before he

joined the committee of public safety, and the laws of the maximum and of the suspects were by no means of his creation. The reason why he is almost universally regarded as its creator and the dominant spirit in the committee of public safety is not hard to discover. Men like Carnot and Billaud-Varenne were not conspicuous speakers in the convention, nor were they the idols of any section of the populace; but Robespierre had a fanatical following among the Jacobins and was admittedly the most popular orator in the convention. His panegyrics on the system of revolutionary government and his praise of virtue led his hearers to believe that the system of the Terror, instead of being monstrous, was absolutely laudable; his pure life and admitted incorruptibility threw a lustre on the committee of which he was a member; and his colleagues offered no opposition to his posing as their representative and reflecting some of his personal popularity upon them so long as he did not interfere with their work. Moreover, he alone never left Paris, whilst all the others, except Barère, were constantly engaged on missions to the armies, the navy, and the provinces. It has been asserted that Robespierre, Couthon, and Saint-Just took upon themselves the direction of "la haute politique," while the other members acted only in subordinate capacities; undoubtedly it would have suited Robespierre to have had this believed, but as a matter of fact he was in no way especially trusted in matters of supreme importance.

After this explanation it may be said at once that Robespierre was not the author of the overthrow of the Dantonists and the Hébertists, though he thoroughly agreed with the majority and had no desire to save them, the principles of both parties being obnoxious to him. The Hébertists were communists in the true meaning of the word. They held that each commune should be self-governing, and, while admitting the right of a central authority to levy men and money for the purposes of the state, they believed that in purely internal matters, as well as in determining the mode in which men and money were to be raised, the local government ought to be supreme. This position of the Hébertists was of course obnoxious to the great committee, who believed that success could only be won by their retention of absolute power; and in the winter of 1794-95 it became obvious that the Hébertist party must perish, or its opposition to the committee would grow too formidable owing to its paramount influence in the commune of Paris. Robespierre shared his colleagues' fear of the Hébertist opinions, and he had a personal reason for disliking that party of atheists and sansculottes, since he believed in the necessity of religious faith, and was too much of a gentleman not to detest their imitation of the grossness that belongs to the lowest class of the populace. In 1792 he had indignantly thrown from him the cap of liberty which an ardent admirer had placed upon his head; he had never pandered to the depraved tastes of the mob by using their language; and to the last day of his life he wore knee-breeches and silk stockings and wore his hair powdered. His position towards the Dantonist party was of a different character. After having seen established the strong executive he had laboured for, and having moved the resolutions which finally consolidated the power of the committee of public safety in September 1793, Danton retired to his country house to enjoy the pleasures of domestic life. But to his retreat came the news of the means the committee used to maintain their supremacy. Danton was not a man who scrupled to shed blood when necessary, but he did not see that this continuous series of sacrifices on the guillotine was necessary; hence he inspired Camille Desmoulins to protest against the Terror in the *Vieux Cordelier*, the noblest expression of revolutionary thought. Where is

this system of terror to end? what is the good of a tyranny comparable only to that of the Roman emperors as described by Tacitus? Such were the questions which Camille Desmoulins asked under Danton's inspiration. This "moderantism," as it was called, was as objectionable to the members of the great committee as the doctrines of the Hébertists. Both parties must be crushed. Before the blows at the leaders of those two parties were struck, Robespierre retired for a month (from 13th February to 13th March 1794) from active business in the convention and the committee, apparently to consider his position; but he came to the conclusion that the cessation of the Reign of Terror would mean the loss of that supremacy by which he hoped to establish the ideal of Rousseau, for Danton, he knew, was essentially a practical statesman and laughed at his ideas. He must have considered too that the result of his siding with Danton would probably have been fatal to himself. The result of his deliberations was that he abandoned Danton and co-operated in the attacks of the committee on the two parties. On the 15th of March he reappeared in the convention; on the 19th Hébert and his friends were arrested; and on the 24th they were guillotined. On the 30th of March Danton, Camille Desmoulins, and their friends were arrested, and on the 5th of April they too were guillotined.

It was not until after the execution of Danton that Robespierre began to develop a policy distinct from that of his colleagues in the great committee, an opposition which ended in his downfall. He began by using his influence over the Jacobin Club to dominate the commune of Paris through his devoted adherents, two of whom, Fleuriot-Lescot and Payan, were elected respectively mayor and procureur of the commune. He also attempted to usurp the influence of the other members of the great committee over the armies by getting his young adherent, Saint-Just, sent on a mission to the frontier. In Paris Robespierre determined to increase the pressure of the Terror: no one should accuse him of moderantism; through the increased efficiency of the revolutionary tribunal Paris should tremble before him as the chief member of the great committee; and the convention should pass whatever measures he might dictate. To secure his aims, Couthon, his other ally in the committee, proposed and carried on the 10th of June the outrageous law of 22d Prairial, by which even the appearance of justice was taken from the tribunal, which, as no witnesses were allowed, became a simple court of condemnation. The result of this law was that between the 12th of June and the 28th of July, the day of Robespierre's death, no less than 1285 victims perished on the guillotine at Paris. But before this there had taken place in Robespierre's life an episode of supreme importance as illustrating his character and his political aims: on the 7th of May he secured a decree from the convention recognizing the existence of the Supreme Being. In His honour a great fête was held on the 8th of June; Robespierre, as president of the convention, walked first and delivered his harangue, and as he looked around him he may well have believed that his position was secured and that he was at last within reach of a supreme power which should enable him to impose his belief on all France, and so ensure its happiness. The majority of the great committee found his popularity—or rather his ascendancy, for as that increased his personal popularity diminished—useful to them, since by increasing the stringency of the Terror he strengthened the position of the committee, whilst attracting to himself, as occupying the most prominent position in it, any latent feeling of dissatisfaction at such stringency. Of the issue of a struggle between themselves and Robespierre they had little fear: they controlled the committee of general security through their alliance with its leaders.

Amar and Vadier; they were certain of obtaining a majority in the convention, for they knew that the chief deputies on the left or the Mountain were Dantonists, who burned to avenge Danton's death; while they felt sure also that the mass of the deputies of the centre or the Marsh could be hounded on against Robespierre if they were to accuse him of aiming at the dictatorship and pour on him the obloquy of having increased the Terror; and they knew finally that his actual adherents, though devoted to him, were few in number. The devotion of these admirers had been further excited by the news that a half-witted girl, named Cécile Renault, had been found wandering near his house, with a knife in her possession, intending to play the part of Charlotte Corday. She was executed on the 17th of June, on the very day that Vadier raised a laugh at Robespierre's expense in the convention by his report on the conspiracy of Catherine Théot, a mad woman, who had asserted that Robespierre was a divinity.

For a statesman to be laughed at in France is fatal to his power, and Robespierre himself felt that he must strike his blow now or never. Yet he was not sufficiently audacious to strike at once, as Payan and Coffinhal, the ablest of his adherents, would have had him do, but retired from the convention for some weeks, as he had done before the overthrow of the Hébertists and the Dantonists, to prepare his plan of action. This retirement seemed ominous to the majority of the great committee, and they too prepared for the struggle by communicating with the deputies of the Mountain, who were either friends of Danton or men of proved energy like Barras, Fréron, and Tallien. These weeks, the last of his life, Robespierre passed very peacefully, according to his wont all through the Revolution. He continued to live with the Duplays, with whose daughter Éléonore he had fallen in love, and used to wander with her and his favourite dog, a great Danish hound, named Bruant, in the Champs Élysées during the long summer evenings. At last, on the 26th of July, Robespierre appeared for the first time for more than four weeks in the convention and delivered a carefully studied harangue, which lasted for more than four hours, in which he declared that the Terror ought to be ended, that certain deputies who had acted unjustly and exceeded their powers ought to be punished, and that the committees of public safety and general security ought to be renewed. Great was the excitement in the convention: all wondered who were the deputies destined to be punished; all were surprised that the Terror should be imputed as a fault to the very committee of which Robespierre had been a member. The majority of the great committee determined to act promptly. The convention, moved by Robespierre's eloquence, at first passed his motions; but he was replied to by Cambon the financier, Billaud-Varenne, Amar, and Vadier, and the convention rescinded their decrees and referred Robespierre's question to their committees. On the following day, the 27th of July, or in the revolutionary calendar the 9th Thermidor, Saint-Just commenced to speak on behalf of the motions of Robespierre, when violent interruptions showed the temper of the convention. Tallien, Billaud-Varenne, and Vadier again attacked Robespierre; cries of "Down with the tyrant!" were raised; and, when Robespierre hesitated in his speech in answer to these attacks, the words "C'est le sang de Danton qui t'étouffe" showed what was uppermost in the minds of the Mountain. The excitement increased, and at five in the afternoon Robespierre, Couthon, and Saint-Just, with two young deputies, Augustin Robespierre and Lebas, the only men in all the convention who supported them, were ordered to be arrested. Yet all hope for Robespierre was not gone; he was speedily rescued from his prison with the other deputies by the troops of the com-

mune and brought to the Hôtel de Ville. There he was surrounded by his faithful adherents, led by Payan and Coffinhal, but the day was past when the commune could overawe the convention; for now the men of action were hostile to the commune, and its chief was not a master of *coups d'état*. On the news of the release of Robespierre, the convention had again met, and declared the members of the commune and the released deputies *hors de la loi*. The national guards under the command of Barras had little difficulty in making their way to the Hôtel de Ville; Robespierre was shot in the lower jaw by a young gendarme named Meda while signing an appeal to one of the sections of Paris to take up arms for him, though the wound was afterwards believed to have been inflicted by himself; and all the released deputies were again arrested. After a night of agony Robespierre was the next day taken before the tribunal, where his identity as an outlaw was proved, and without further trial he was executed with Couthon and Saint-Just and nineteen others of his adherents on the Place de la Révolution on the 10th Thermidor (28th July) 1794.

The character of Robespierre when looked upon simply in the light of his actions and his authenticated speeches, and apart from the innumerable legends which have grown up about it, is not a difficult one to understand. A well-educated and accomplished young lawyer, he might have acquired a good provincial practice and lived a happy provincial life had it not been for the Revolution. Like thousands of other young Frenchmen, he had read the works of Rousseau and taken them as gospel. Just at the very time in life when this illusion had not been destroyed by the realities of life, and without the experience which might have taught the futility of idle dreams and theories, he was elected to the states-general. At Paris he was not understood till he met with his audience of fellow-disciples of Rousseau at the Jacobin Club. His fanaticism won him supporters; his singularly sweet and sympathetic voice gained him hearers; and his upright life attracted the admiration of all. As matters approached nearer and nearer to the terrible crisis, he failed, except in the two instances of the question of war and of the king's trial, to show himself a statesman, for he had not the liberal views and practical instincts which made Mirabeau and Danton great men. His admission to the great committee gave him power, which he hoped to use for the establishment of his favourite theories, and for the same purpose he acquiesced in and even heightened the horrors of the Reign of Terror. It is here that the fatal mistake of allowing a theorist to have power appeared: Billaud-Varenne systematized the Terror because he believed it necessary for the safety of the country; Robespierre intensified it in order to carry out his own ideas and theories. Robespierre's private life was always respectable: he was always emphatically a gentleman and man of culture, and even a little bit of a dandy, scrupulously honest, truthful, and charitable. In his habits and manner of life he was simple and laborious; he was not a man gifted with flashes of genius, but one who had to think much before he could come to a decision, and he worked hard all his life.

The great authority for Robespierre's life is Ernest Hamel's elaborate *Vie de Robespierre*, 8 vols., Paris, 1865-67, in which every fact regarding him is carefully sifted; it is indeed an unqualified defence and eulogy throughout, but, without adopting his particular views, Hamel's biography is the only one of any value. Consult also for his early life M. Paris's *La Jeunesse de Robespierre*. The *Mémoires de Robespierre* and the *Mémoires de Charlotte Robespierre* are both worthless forgeries. (H. M. S.)

ROBIN HOOD. The oldest mention of Robin Hood at present known occurs in the second edition—what is called the B text—of *Piers the Plowman*, the date of which is about 1377. In passus v. of that poem the figure of Sloth is represented as saying:

"I can nouȝte perfily my pater-noster, as the prest it syngeth:
But I can rymes of Robyn Hood and Randolf Erle of Chesterer."
He is next mentioned by Wynthown in his *Scottish Chronicle*, written about 1420:

"Lytel Jhon and Robyne Hude
Waythmen ware commendyd gude;
In Yngilwode and Barnysdale
Thai oysyd all this time [c. 1288] thare trawale";

next by Bower in his additions to Fordun's *Scotichronicon* about 1450:

"Hoc in tempore [1266] de exheredatis et bannitis surrexit et caput erexit ille famosissimus sicarius Robertus Hode et Littill Johanne cum eorum complicitibus, de quibus stolidum vulgus hianter

in comœdiis et tragœdiis prurienter festum faciunt et super ceteras romancias, mimos, et bardanos cantitare delectantur."

Of his popularity in the latter half of the 15th and in the 16th centuries there are many signs. Just one passage must be quoted as of special importance because closely followed by Grafton, Stow, and Camden. It is from Mair's *Historia Majoris Britanniae tam Angliæ quam Scotiæ*, which appeared in 1521.

"Circa hæc tempora [Ricardi Primi], ut auguror, Robertus Hudus Anglus et Parvus Joannes latrones famatissimi in nemoribus latuerunt, solum opulentorum virorum bona deripientes. Nullum nisi eos invadentem vel resistentem pro suarum rerum tuitione occiderunt. Centum sagittarios ad pugnam aptissimos Robertus latrociniiis aluit, quos 400 viri fortissimi invadere non audebant. *Rebus hujus Roberti gestis tota Britannia in cantibus utitur.* Fæminam nullam opprimi permisit nec pauperum bona surripuit, verum eos ex abbatum bonis sublatiis opipare pavit. Viri rapinam improbo, sed latronum omnium humanissimus et princeps erat."

In the Elizabethan era and afterwards mentions abound; see the works of Shakespeare, Ben Jonson, Drayton, Warner, Munday, Camden, Stow, Braithwaite, Fuller, &c.

Of the ballads themselves, *Robin Hood and the Monk* is possibly as old as the reign of Edward II.; *Robin Hood and the Potter* and *Robyn and Gandelyn* are certainly not later than the 15th century. Most important of all is *A Lytell Geste of Robyn Hode*, which perhaps was first printed about 1490, although the earliest extant complete copy belongs to about 1520. This is evidently founded on older ballads; we read in *The Seconde Fyfte*, ll. 176 and 177:

"He wente hym forthe full mery syngyng,
As men have told in tale."

In fact it does for the Robin Hood cycle what a few years before Sir Thomas Malory had done for the Arthurian romances,—what in the 6th century B.C. Pisistratus is said to have done for the Homeric poems.

These are the facts about him and his balladry. Of conjectures there is no end. He has been represented as the last of the Saxons,—as a Saxon holding out against the Norman conquerors so late as the end of the 12th century (see Thierry's *Norman Conquest*, and compare *Ivanhoe*). Others maintain that he was a follower of Simon de Montfort. A third theory associates him with the earl of Lancaster of Edward II.'s time: Hunter believed that he could identify him with a certain Robin Hood mentioned in the Exchequer accounts of this reign.

For our part, we are not disinclined to believe that the Robin Hood story has some historical basis, however fanciful and romantic the superstructure. We parallel it with the Arthurian story, and hold that, just as there was probably a real Arthur, however different from the hero of the trouvères, so there was a real Hood, however now enlarged and disguised by the accretions of legend. That Charlemagne and Richard I. of England became the subjects of romances does not prevent our believing in their existence; nor need Hood's mythical life deprive him of his natural one. Sloth in Langland's poem couples him, as we have seen, with Randle, earl of Chester; and no one doubts this nobleman's existence because he had "rymes" made about him. We believe him to have been the third Randle (see Bishop Percy's Folio MS., ed. Hales and Furnivall, i. 260). And possibly enough Hood was contemporary with that earl, who "flourished" in the reigns of Richard I., John, and Henry III. Wyntown and Major, as we have seen, assign him to that period. It is impossible to believe with Hunter that he lived so late as Edward II.'s reign. This would leave no time for the growth of his myth; and his myth was, as is evident from what we have already said and quoted, full grown in the first half of the 14th century.

But, whether he lived or not, and whenever he lived, it is certain that many mythical elements are contained in

his story. Both his name and his exploits remind us of the woodland spirit Robin Goodfellow and his merry pranks. He is fond of disguising himself, and devoted to fun and practical jokes. And the connexion of the May games with him points to a fusion with some older memory,—with some sun-god. In fact, the outlaw would seem to have become a centre around which gathered and settled older traditions of men and of spirits and of gods. Folklore that was rapidly perishing thus gave itself a new consistency and life. The name Robin (a French form from Rob, which is of course a short form for Robert) would serve both for "the shrewd and knavish sprite"—the German Knecht Ruprecht (see Grimm's *Teut. Myth.*, p. 504, trans. Stallybrass)—and for the bandit (see "Roberdes Knaues" in the Prologue of *Piers the Plowman*, l. 44 and the note in Warton's *Hist. of Eng. Poet.*, ii. 95, ed. 1840). The name Hood is still a common enough surname, of which the earlier shape is Odo (see "Houdart," &c., in Larchey's *Dict. des Noms*); notice too the name Hudson. But it also reminds one of the German familiar spirit Hudekin, or possibly of the German Witikind (see Wright's *Essays on the Middle Ages*, ii. 207). How certain it is that the Robin Hood story attracted to it and appropriated other elements is illustrated by its subsequent history,—its history after the 14th century. Thus later on we find it connected with the Morris dance; but the Morris dance was not known in England before the 16th century, or late in the 15th. And the form of the story was greatly modified in the beginning of the 17th century to suit the ideas of the age. It was then that a peer was imported into it, and the yeoman of the older version was metamorphosed into the earl of Huntingdon, for whom in the following century Stukeley discovered a satisfactory pedigree! At last, with the change of times, the myth ceased growing. Its rise and development and decay deserve a more thorough study than they have yet received.

What perhaps is its greatest interest as we first see it is its expression of the popular mind about the close of the Middle Ages. Robin Hood is at that time the people's ideal as Arthur is that of the upper classes. He is the ideal yeoman as Arthur is the ideal knight. He readjusts the distribution of property: he robs the rich and endows the poor. He is an earnest worshipper of the Virgin, but a bold and vigorous hater of monks and abbots. He is the great sportsman, the incomparable archer, the lover of the greenwood and of a free life, brave, adventurous, jocular, open-handed, a protector of women. Observe his instructions to Little John:—

"Loke ye do no housbonde harme
That tylleth with his plough.
No more ye shall no good yeman
That walketh by grene wode shawe,
Ne no knyght ne no squyer
That wolde be a good felawe.
These bysshoppes and thyse archebysshoppes
Ye shall them bete and bynde;
The hye sheryfe of Notyngname
Hym holde in your mynde."

And we are told

"Robin loved our dere lady
For doute of dedely synne;
Wolde he never do company harme
That ony woman was ynn."

See also Drayton's *Polyolbion*, Song xxvi. The story is localized in Barnsdale and Sherwood, i.e., between Doncaster and Nottingham.

The best collections of the Robin Hood poems are those of Ritson (8vo, 1795) and Gutch (2d ed., 1847), and of Professor Child in the 5th volume of his invaluable *English and Scotch Ballads*. The versions in the Percy Folio MS. are unhappily mutilated; but they should be consulted, for they are all more or less unique, and that on "Robin Hode's death" is of singular interest. The literary and artistic value of the Robin Hood ballads cannot be pronounced consider-

able; their value is great, but it is in other respects. There is, however, real vigour and force in this fragment on the hero's death. The earliest "Garland" was printed in 1670. (J. W. H.)

ROBIN REDBREAST. See REDBREAST.

ROBINS, BENJAMIN (1707-1751), an English natural philosopher, was born at Bath in 1707. His parents were Quakers in poor circumstances, and gave him very little education. Aided solely by his own talent for exact science, he made considerable progress, and attracted so much notice that he was introduced to Pemberton, who befriended and encouraged him. For a time he maintained himself by teaching mathematics, but soon devoted himself to more congenial work. In particular he carried out an extensive series of experiments in gunnery, the results of which were afterwards embodied in his famous treatise on *New Principles in Gunnery* (8vo, London, 1742). In this treatise is described the ballistic pendulum, an instrument which has become classical in the history of dynamics, and which bears the name of its inventor. Robins also made a number of very important experiments on the resistance of the air to the motion of projectiles, and on the force of gunpowder, with computation of the velocities thereby communicated to military projectiles. He compared the results of his theory with experimental determinations of the ranges of mortars and cannon, and gave practical maxims for the management of artillery. He also made observations on the flight of rockets and wrote on the advantages of rifled barrels. So great was his fame as a scientific artillerist that Euler translated his work on gunnery into German and added to it a critical commentary of his own. Of less interest nowadays are Robins's more purely mathematical writings, such as his *Discourse concerning the Nature and Certainty of Sir Isaac Newton's Methods of Fluxions and of Prime and Ultimate Ratios* (8vo, London, 1735), "A Demonstration of the Eleventh Proposition of Sir Isaac Newton's Treatise of Quadratures" (*Phil. Trans.*, 1727), and similar works. Besides his scientific labours Robins took an active part in politics. He wrote pamphlets in support of the opposition to Sir Robert Walpole, and was secretary of a committee appointed by the House of Commons to inquire into the conduct of that minister. He also wrote a preface to the *Report on the Proceedings of the Board of General Officers on their Examination into the Conduct of Lieutenant-General Sir John Cope*, in which he gave an apology for the affair at Prestonpans. In 1750 he was appointed engineer-general to the East India Company, and went out to superintend the reconstruction of their forts. The climate, however, disagreed with him, and he died on 29th July 1751. His works were published in two volumes 8vo in 1761.

ROBINSON, EDWARD (1794-1863), author of the *Biblical Researches*, a son of the Rev. William Robinson, of Puritan ancestry, was born at Southington, Connecticut, United States, on 10th April 1794. He was educated at Hamilton College, New York, where he graduated in 1816. He served as a tutor at the college during 1817-18, and then engaged in private study of the Greek classics until 1821, when he went to Andover, Massachusetts, in order to publish an edition of the *Iliad*. There he became a pupil of Moses Stuart, the enthusiastic professor of Biblical studies in the theological seminary, and was made instructor of Hebrew there in 1823. In 1826 he resigned his position at Andover and went to Europe, where he studied Hebrew under Gesenius at Halle, and also history at Berlin under Neander, remaining in Europe until 1830. In 1828 he married Therese Albertine Luise von Jakob, daughter of an eminent professor of philosophy at Halle. This highly cultured lady was already well known as an authoress under the pseudonym of "Talvj." She became of great assistance to her husband in his learned pur-

suits. In 1830 he was again called to Andover as professor extraordinary of Biblical literature, and entered with enthusiasm upon the work of instruction and the publication of scholarly works upon the Bible. In 1831 he founded the *Biblical Repository*, a theological review which introduced a new era in theological periodicals in America, and which subsequently passed over into the *Bibliotheca Sacra*. In the same year he received the degree of D.D. from Dartmouth College. In 1832 he published a revised edition of Taylor's translation of Calmet's *Dictionary of the Bible*, and in the ensuing year a popular *Dictionary of the Bible* and a translation of Buttmann's *Greek Grammar* (3d ed., 1851). Such severe literary work deprived him of his health and he was compelled to resign his professorship. He now devoted himself entirely to literary pursuits for some years. In 1834 he published a revised edition of Newcome's *Greek Harmony of the Gospels*. In 1836 he issued a translation of Gesenius's *Hebrew Lexicon* and in the same year a *Greek and English Lexicon of the New Testament*. These lexicons have been the companions of Biblical students until the present time, having passed through a series of revisions. The *Hebrew Lexicon* reached a fifth edition in 1854, the *Greek Lexicon* a second edition in 1847. They are both now (1885) passing through another revision by his pupils. In 1837 Robinson was called to the professorship of Biblical literature in the Union Theological Seminary, New York, in which position he remained until his death, giving it the reputation of his scholarship and the benefits of his great experience in Biblical study and practical skill in instruction. In his letter of acceptance he gave an outline of the field of Biblical study which showed his mastery of the subject and his forecast of its future in America. He accepted this position with the understanding that he should receive leave of absence for some years in order to explore the lands of the Bible. He spent a considerable portion of the year 1838 in these explorations and became the pioneer and father of modern Biblical geography. He published his *Biblical Researches* in 1841 in three volumes, simultaneously in Berlin and Boston. His services were recognized by a gold medal from the Royal Geographical Society of London in 1842, the degree of D.D. from the university of Halle in 1842, and the degree of LL.D. from Yale College in 1844. In 1852 he made a second visit to Palestine and published its results in the supplemental volume to the second edition of his *Biblical Researches* in 1856. The third edition of the whole work appeared in 1867 in three volumes. Robinson regarded these researches as preliminary to a systematic work on the geography of the Bible; but he was spared only to complete a mere fragment, which was published posthumously under the title of *Physical Geography of the Holy Land* in 1865. In 1845 Robinson also issued a *Greek Harmony of the Gospels* and in 1846 an *English Harmony*, both of which have passed through many editions and have remained the standard text-books in America until the present day. The *Greek Harmony* has renewed its life in a revised edition by Professor Riddle in 1885. Besides these more important works he published from time to time a vast number of articles in periodicals, and in 1859 a *Memoir of the Rev. William Robinson*, his father. Robinson was an ordained minister of the Presbyterian Church, but his voice was seldom heard in the pulpit or in ecclesiastical bodies. In his declining years he was afflicted with an incurable disease of the eyes and other maladies. He died in New York City on 27th January 1863.

Robinson's work in Biblical geography was both fundamental and monumental. Dean Stanley once said, "Dr Robinson was the first man who saw Palestine with his eyes open to what he ought

to see"; and Ritter recognizes the "union of the acutest observation of topographical and local conditions with much preparatory study." He was gifted with great practical sense and unusual accuracy of observation; but he was extreme in his criticism of the local legends of the Holy Land, and not sufficiently skilled in historic criticism. Although great progress has been made in Biblical geography in the last quarter of this century, yet the work of Robinson is still classical.

See *The Life, Writings, and Character of Edward Robinson*, by Henry B. Smith and Boswell D. Hitchcock (New York, 1883), and *Services in Adam's Chapel at the Dedication of the New Buildings of Union Theological Seminary* (New York, 1885).

ROBINSON, JOHN (1575-1625), one of the founders of Independency in England (see vol. xii. p. 725), was born most probably near Scrooby in Nottinghamshire in 1575. He was entered of Corpus Christi College, Cambridge, in 1592, and graduated in ordinary course, becoming a fellow in 1599. Having taken orders he officiated for some time in the neighbourhood of Norwich, but his Puritan leanings soon caused his suspension by the bishop. After having ministered for some time to a congregation of sympathizers in Norwich he resigned his fellowship in 1604, and, proceeding to Gainsborough in Lincolnshire, he there joined a company who had bound themselves by covenant before God "to walk in all His ways made known or to be made known unto them, according to their best endeavours, whatever it should cost them." In 1606 he became minister at Scrooby, but the increasing hostility of the authorities towards nonconformity soon forced him and his people to think of flight, and, not without difficulty, they succeeded in making their escape in detachments to Holland. Robinson settled in Amsterdam in 1608, but in the following year removed to Leyden, and ministered there to members of his former congregation. In 1620 a considerable minority of these sailed for England in the "Speedwell," and ultimately crossed the Atlantic in the "Mayflower"; it was Robinson's intention to follow as soon as practicable along with the rest of his flock, but he died before the plan could be carried out, on 1st March 1625.

Besides preaching to his congregation, and, during his later years, corresponding with those of his people who had settled in New England, Robinson devoted himself to theological study, and became a member of the university of Leyden. Amongst his other publications may be mentioned *Justification of Separation from the Church* (1610), *Apologia Brownistarum* (1619), *A Defence of the Doctrine propounded by the Synod of Dort* (1624), and a volume of *Essays, or Observations Divine and Moral*, printed in 1628. His *Works*, with a memoir by R. Ashton, were reprinted in 3 vols. in 1851.

ROBINSON, JOHN THOMAS ROMNEY (1792-1882), the inventor of the cup-anemometer, was born in Dublin on 23d April 1792. He studied at Trinity College and obtained a fellowship in 1814; for some years he was deputy professor of natural philosophy, until he relinquished his fellowship in 1821 on obtaining the college living of Enniskillen. In 1823 he was appointed astronomer of the Armagh observatory (see OBSERVATORY), with which he (from 1824) combined the living of Carrickmacross, but he always resided at the observatory, engaged in researches connected with astronomy and physics, until his death on 28th February 1882.

Robinson wrote a number of papers in scientific journals and transactions, and the Armagh catalogue of stars (*Places of 5345 Stars observed from 1828 to 1854 at the Armagh Observatory*, Dublin, 1859), but he is best known as the inventor of the cup-anemometer for registering the velocity of the wind. This instrument (which he erected at the Armagh observatory in 1846 and which has since come into general use) consists of four light arms forming a horizontal cross, carrying four hemispherical cups and turning freely about a vertical axis. By an endless screw attached to the axis a system of wheelwork is set going, and the velocity of the wind is indicated by one or more dials, or it may be registered continuously by a pencil drawn by clockwork along a dial or drum turned by the anemometer, or (as in the modification now generally used) by a metallic screw of only one thread, which leaves a tracing on a sheet of metallic paper folded round a drum revolving by clockwork. It has been found by elaborate experiments by Dr Robinson (*Trans. R. Irish Academy*, vol. xxii.; *Phil. Trans.*, 1878 and 1880) and

others that the centre of each cup moves with a velocity very nearly equal to one-third of that of the wind.

ROB ROY (c. 1660-1734), the popular designation of a famous Highland outlaw whose prowess is the theme of one of Sir Walter Scott's novels, was by descent a Macgregor, being the younger son of Donald Macgregor of Glengyle, who had attained the rank of lieutenant-colonel in the army of James II., by his wife, a daughter of William Campbell of Glenfalloch. He received the name Roy from the red hair which clustered in thick curls over his brow, and latterly adopted Campbell as his surname on account of the Acts proscribing the name of his clan. Though in stature not much above the middle height, he was so muscular and thickly set that few were his equals in feats of strength, while the unusual length of his arms gave him an extraordinary advantage in the use of the sword. His eyes were remarkably keen and piercing, and his whole expression indicated a mental prowess forming an appropriate complement to his powerful physical frame. He inherited a small property on the Braes of Balquhider, and at first devoted himself to the rearing of cattle. Having formed a band of armed clansmen, he obtained, after the accession of William III., a commission from James II. to levy war on all who refused to acknowledge him as king, and in the autumn of 1691 made a descent on Stirlingshire to carry off the cattle of Lord Livingstone, when, being opposed by the villagers of Kippen, he also seized the cattle from all the byres of the village. Shortly afterwards he married Mary, daughter of Macgregor of Comar. On the death of Gregor Macgregor, the chief of the clan, in 1693 he managed, though not the nearest heir, to get himself acknowledged chief, obtaining control of the lands stretching from the Braes of Balquhider to the shores of Loch Lomond, and situated between the possessions of Argyll and those of Montrose. To assist in carrying on his trade as cattle-dealer he borrowed money from the duke of Montrose, and, being on account of losses unable to repay it, he was in 1712 evicted from his property and declared an outlaw. Taking refuge in the more inaccessible Highlands, Rob Roy from this time forward supported himself chiefly by depredations committed in the most daring manner on the duke and his tenants, all attempts to capture him being unsuccessful. During the rebellion of 1715, though nominally siding with the Pretender, he did not take an active part in the battle of Sheriffmuir except in plundering the dead on both sides. He was included in the Act of Attainder; but, having for some time enjoyed the friendship of the duke of Argyll, he obtained, on making his submission at Inveraray, a promise of protection. He now established his residence at Craigroyston near Loch Lomond, whence for some time he levied black mail as formerly upon Montrose, escaping by his wonderful address and activity every effort of the English garrison stationed at Inversnaid to bring him to justice. In his later years he was, through the mediation of Argyll, reconciled to Montrose. According to a notice in the *Caledonian Mercury* he died at Balquhider on 28th December 1734. He was buried in Balquhider churchyard.

K. Macleay, *Historical Memoirs of Rob Roy* (1818; new ed. 1881); Sir Walter Scott, *Highland Clans*; A. H. Miller, *Story of Rob Roy* (1883).

ROBUSTI, JACOPO (1518-1594), commonly called IL TINTORETTO or TINTORET, one of the greatest painters of the Venetian or of any school, was born in Venice in 1518, though most accounts say in 1512. His father, Battista Robusti, was a dyer, or "tintore"; hence the son got the nickname of "Tintoretto," little dyer, or dyer's boy. In childhood Jacopo, a born painter, began daubing on the dyer's walls; his father, noticing his bent, took him round, still in boyhood, to the studio of Titian,

to see how far he could be trained as an artist. We may suppose this to have been towards 1533, when Titian was already fifty-six years of age. Ridolfi is our authority for saying that Tintoret had only been ten days in the studio when Titian sent him home once and for all. The reason, according to the same writer, is that the great master observed some very spirited drawings, which he learned to be the production of Tintoret; and it is inferred that he became at once jealous of so promising a scholar. This, however, is mere conjecture; and perhaps it may be fairer to suppose that the drawings exhibited so much independence of manner that Titian judged that young Robusti, although he might become a painter, would never be properly a pupil. From this time forward the two always remained upon distant terms,—Robusti being indeed a professed and ardent admirer of Titian, but never a friend, and Titian and his adherents turning the cold shoulder to Robusti. Active disparagement also was not wanting, but it passed disdainfully unnoticed by Tintoret. The latter sought for no further teaching, but studied on his own account with laborious zeal; he lived poorly, collecting casts, bas-reliefs, &c., and practising by their aid. His noble conception of art and his high personal ambition were evidenced in the inscription which he placed over his studio,—“*Il disegno di Michelangelo ed il colorito di Tiziano*” (Michelangelo’s design and Titian’s colour). He studied more especially from models of Buonarroti’s Dawn, Noon, Twilight, and Night, and became expert in modelling in wax and clay,—a method (practised likewise by Titian) which afterwards stood him in good stead in working out the arrangement of his pictures. The models were sometimes taken from dead subjects dissected or studied in anatomy schools; some were draped, others nude, and Robusti was wont to suspend them in a wooden or cardboard box, with an aperture for a candle. Now and afterwards he very frequently worked by night as well as by day. The young painter Schiavone, four years Robusti’s junior, was much in his company. Tintoret helped Schiavone gratis in wall-paintings; and in many subsequent instances he worked also for nothing, and thus succeeded in obtaining commissions. The two earliest mural paintings of Robusti—done, like others, for next to no pay—are said to have been Belshazzar’s Feast and a Cavalry Fight, both long since perished. Such, indeed, may be said to have been the fate of all his frescos, early or later. The first work of his which attracted some considerable notice was a portrait-group of himself and his brother—the latter playing a guitar—with a nocturnal effect; this also is lost. It was followed by some historical subject, which Titian was candid enough to praise. One of Tintoret’s early pictures still extant is in the church of the Carmine in Venice, the Presentation of Jesus in the Temple; also in S. Benedetto are the Annunciation and Christ with the Woman of Samaria. For the Scuola della Trinità (the scuole or schools of Venice were more in the nature of hospitals or charitable foundations than of educational institutions) he painted four subjects from Genesis. Two of these, now in the Venetian Academy, are Adam and Eve and the Death of Abel, both noble works of high mastery, which leave us in no doubt that Robusti was by this time a consummate painter,—one of the few who have attained to the highest eminence by dire study of their own, unseconded by any training from some senior proficient.

Towards 1546 Robusti painted for the church of S. Maria dell’ Orto three of his leading works—the Worship of the Golden Calf, the Presentation of the Virgin in the Temple, and the Last Judgment—now shamefully repainted; and he settled down in a house hard by the church. It is a Gothic edifice, looking over the lagoon of Murano to the Alps, built in the Fondamenta de’ Mori,

still standing, but let out cheap to artisans. In 1548 he was commissioned for four pictures in the Scuola di S. Marco—the Finding of the Body of St Mark in Alexandria (now in the church of the Angeli, Murano), the Saint’s Body brought to Venice, a Votary of the Saint delivered by invoking him from an Unclean Spirit (these two are in the library of the royal palace, Venice), and the highly and justly celebrated Miracle of the Slave. This last, which forms at present one of the chief glories of the Venetian Academy, represents the legend of a Christian slave or captive who was to be tortured as a punishment for some acts of devotion to the evangelist, but was saved by the miraculous intervention of the latter, who shattered the bone-breaking and blinding implements which were about to be applied. These four works were greeted with signal and general applause, including that of Titian’s intimate, the too potent Pietro Aretino, with whom Tintoret, one of the few men who scorned to curry favour with him, was mostly in disrepute. It is said, however, that Tintoret at one time painted a ceiling in Pietro’s house; at another time, being invited to do his portrait, he attended, and at once proceeded to take his sitter’s measure with a pistol (or else a stiletto), as a significant hint that he was not exactly the man to be trifled with. The painter having now executed the four works in the Scuola di S. Marco, his straits and obscure endurances were over. He married Faustina de’ Vescovi, daughter of a Venetian nobleman. She appears to have been a careful housewife, and one who both would and could have her way with her not too tractable husband. Faustina bore him several children, probably two sons and five daughters.

The next conspicuous event in the professional life of Tintoret is his enormous labour and profuse self-development on the walls and ceilings of the Scuola di S. Rocco, a building which may now almost be regarded as a shrine reared by Robusti to his own genius. The building had been begun in 1525 by the Lombardi, and was very deficient in light, so as to be particularly ill-suited for any great scheme of pictorial adornment. The painting of its interior was commenced in 1560. In that year five principal painters, including Tintoret and Paul Veronese, were invited to send in trial-designs for the centre-piece in the smaller hall, named Sala dell’ Albergo, the subject being S. Rocco received into Heaven. Tintoret produced not a sketch but a picture, and got it inserted into its oval. The competitors remonstrated, not unnaturally; but the artist, who knew how to play his own game, made a free gift of the picture to the saint, and, as a bye-law of the foundation prohibited the rejection of any gift, it was retained *in situ*,—Tintoret furnishing gratis the other decorations of the same ceiling. In 1565 he resumed work at the scuola, painting the magnificent Crucifixion, for which a sum of 250 ducats was paid. In 1576 he presented gratis another centre-piece,—that for the ceiling of the great hall, representing the Plague of Serpents; and in the following year he completed this ceiling with pictures of the Paschal Feast and Moses striking the Rock,—accepting whatever pittance the confraternity chose to pay. Robusti next launched out into the painting of the entire scuola and of the adjacent church of S. Rocco. He offered in November 1577 to execute the works at the rate of 100 ducats per annum, three pictures being due in each year. This proposal was accepted and was punctually fulfilled, the painter’s death alone preventing the execution of some of the ceiling-subjects. The whole sum paid for the scuola throughout was 2447 ducats. Disregarding some minor performances, the scuola and church contain fifty-two memorable paintings, which may be described as vast suggestive sketches, with the mastery, but not the deliberate precision, of finished pictures, and adapted for being

looked at in a dusky half-light. Adam and Eve, the Visitation, the Adoration of the Magi, the Massacre of the Innocents, the Agony in the Garden, Christ before Pilate, Christ carrying His Cross, and (this alone having been marred by restoration) the Assumption of the Virgin are leading examples in the scuola; in the church, Christ curing the Paralytic.

It was probably in 1560, the same year when he began working in the Scuola di S. Rocco, that Tintoret commenced also his numerous paintings in the ducal palace; he then executed there a portrait of the doge, Girolamo Priuli. Other works which were destroyed in the great fire of 1577 succeeded,—the Excommunication of Frederick Barbarossa by Pope Alexander III. and the Victory of Lepanto. After the fire Tintoret started afresh, Paul Veronese being his colleague; their works have for the most part been disastrously and disgracefully retouched of late years, and some of the finest monuments of pictorial power ever produced are thus degraded to comparative unimportance. In the Sala dello Scrutinio Robusti painted the Capture of Zara from the Hungarians in 1346 amid a hurricane of missiles; in the hall of the senate, Venice, Queen of the Sea; in the hall of the college, the Espousal of St Catherine to Jesus; in the Sala dell' Anticollegio, four extraordinary masterpieces—Bacchus, with Ariadne crowned by Venus, the Three Graces and Mercury, Minerva discarding Mars, and the Forge of Vulcan—which were painted for fifty ducats each, besides materials, towards 1578; in the Antichiesetta, St George and St Nicholas, with St Margaret (the female figure is sometimes termed the princess whom St George rescued from the dragon), and St Jerome and St Andrew; in the hall of the great council, nine large compositions, chiefly battle-pieces. We here reach the crowning production of Robusti's life, the last picture of any considerable importance which he executed, the vast Paradise, in size 74 feet by 30, reputed to be the largest painting ever done upon canvas. It is a work so stupendous in scale, so colossal in the sweep of its power, so reckless of ordinary standards of conception or method, so pure an inspiration of a soul burning with passionate visual imagining, and a hand magical to work in shape and colour, that it has defied the connoisseurship of three centuries, and has generally (though not with its first Venetian contemporaries) passed for an eccentric failure; while to a few eyes (including those of the present writer) it seems to be so transcendent a monument of human faculty applied to the art pictorial as not to be viewed without awe nor thought of without amazement. While the commission for this huge work was yet pending and unassigned Robusti was wont to tell the senators that he had prayed to God that he might be commissioned for it, so that paradise itself might perchance be his recompense after death. Upon eventually receiving the commission in 1588 he set up his canvas in the Scuola della Misericordia and worked indefatigably at the task, making many alterations and doing various heads and costumes direct from nature. When the picture had been brought well forward he took it to its proper place and there finished it, assisted by his son Domenico for details of drapery, &c. All Venice applauded the superb achievement, which has in more recent times suffered from neglect, but fortunately hardly at all from restoration. Robusti was asked to name his own price, but this he left to the authorities. They tendered a handsome amount; Robusti is said to have abated something from it, which is even a more curious instance of ungreediness for pelf than earlier cases which we have cited where he worked for nothing at all.

After the completion of the Paradise Robusti rested for a while, and he never undertook any other work of

importance, though there is no reason to suppose that his energies were exhausted, had his days been a little prolonged. He was seized with an attack in the stomach, complicated with fever, which prevented him from sleeping and almost from eating for a fortnight, and on 31st May 1594 he died. A contemporary record states his age to have been seventy-five years and fifteen days. If this is accurate, 16th May 1519 must have been the day of his birth; but we prefer the authority of the register of deaths in S. Marciliano, which states that Tintoret died of fever, aged seventy-five years, eight months, and fifteen days,—thus bringing us to 16th September 1518 as the true date of his birth. He was buried in the church of S. Maria dell' Orto by the side of his favourite daughter Marietta, who had died in 1590, aged thirty; there is a well-known tradition that as she lay dead the heart-stricken father painted her portrait. Marietta had herself been a portrait-painter of considerable skill, as well as a musician, vocal and instrumental; but few of her works are now traceable. It is said that up to the age of fifteen she used to accompany and assist her father at his work, dressed as a boy; eventually she married a jeweller, Mario Augusta. In 1866 the grave of the Vescovi and Robusti was opened, and the remains of nine members of the joint families were found in it; a different locality, the chapel on the right of the choir, was then assigned to the grave. Tintoret painted his own portrait at least twice, one of the heads being in the Uffizi Gallery of Florence and the other, done when his age was advanced, in the Louvre. It is a very serious face, somewhat blunt and rugged, but yet refined without the varnish of elegance—concentrated and resolute, its native ardours of frankness and energy welded down into lifelong laboriousness, with a pent look as of smouldering fire. The eyes are large, dark, and round; the grizzled hair close and compact. The face has been held to bear some resemblance to that of Michelangelo, but this does not go very far. Robusti appears also as one of the figures in the two vast pictures by Paul Veronese,—the Marriage in Cana and the Feast in the House of Levi.

Audacious and intrepid, though not constantly correct, as a draughtsman, majestically great as a colourist, prodigious as an executant, Tintoret was as absolute a type of the born painter as the history of art registers or enables us to conceive. Whatever he did was imaginative—sometimes beautiful and suave (and he was eminently capable of painting a lovely female countenance or an heroic man), often imposing and romantic, fully as often turbulent and reckless, sometimes trivial, never unpainter-like or prosaic. When he chose—which was not always—he painted his entire personages characteristically; but, like the other highest masters of Venice, he conceded and attended little to the expression of his faces as evincing incidental emotion. In several of his works—as especially the great Crucifixion in S. Rocco—there is powerful central thought, as well as inventive detail; but his imagination is always concrete: it is essentially that of a painter to whom the means of art—the form, colour, chiaroscuro, manipulation, scale, distribution—are the typical and necessitated realities. What he imagines is always a visual integer, a picture—never a treatise, however thoughtfully planned or ingeniously detailed. Something that one could see—that is his ideal, not something that one could narrate, still less that one could deduce and demonstrate. In his treatment of action or gesture the most constant peculiarity is the sway and swerve of his figures: they bend like saplings or rock like forest-boughs in a gale; stiffness or immobility was entirely foreign to his style, which has therefore little of the monumental or severe character. Perhaps he felt that there was no other way for combining “the colour of Titian with the design of Michelangelo.” The knitted strength and the transcendent fervour of energy of the supreme Florentine might to some extent be emulated; but, if they were to be united with the glowing fusion of hue of the supreme Venetian, this could only be attained by a process of relaxing the excessive tension and modifying muscular into elastic force. In this respect he was a decided innovator; but he had many imitators,—comparatively feeble, if we except Paul Veronese.

Tintoret scarcely ever travelled out of Venice. He loved all the arts, played in youth the lute and various instruments, some of

them of his own invention, and designed theatrical costumes and properties, was versed in mechanics and mechanical devices, and was a very agreeable companion. For the sake of his work he lived in a most retired fashion, and even when not painting was wont to remain in his working room surrounded by casts. Here he hardly admitted any, even intimate friends, and he kept his modes of work secret, save as regards his assistants. He abounded in pleasant witty sayings whether to great personages or to others, but no smile hovered on his lips. Out of doors his wife made him wear the robe of a Venetian citizen; if it rained she tried to induce him with an outer garment, but this he resisted. She would also when he left the house wrap up money for him in a handkerchief, and on his return expected an account of it; Tintoret's accustomed reply was that he had spent it in alms to the poor or to prisoners. In 1574 he obtained the reversion of the first vacant broker's patent in a fondaco, with power to bequeath it,—an advantage granted from time to time to pre-eminent painters. For his phenomenal energy in painting he was termed "Il Furioso." An agreement is extant showing that he undertook to finish in two months two historical pictures each containing twenty figures, seven being portraits. The number of his portraits is enormous; their merit is unequal, but the really fine ones cannot be surpassed. Sebastian del Piombo remarked that Robusti could paint in two days as much as himself in two years; Annibale Caracci that Tintoret was in many pictures equal to Titian, in others inferior to Tintoret. This was the general opinion of the Venetians, who said that he had three pencils—one of gold, the second of silver, and the third of iron. The only pictures (if we except his own portrait) on which he inscribed his name are the Miracle of Cana in the church of the Salute (painted originally for the brotherhood of the Crociferi), the Miracle of the Slave, and the Crucifixion in the Scuola di S. Rocco; the last was engraved in 1589 by Agostino Caracci. Generally he painted at once on to the canvas without any preliminary. Some of his dicta on art have been recorded as follows by Ridolfi:—"the art of painting remains increasingly difficult"; "painters in youth should adhere to the best masters, these being Michelangelo and Titian, and should be strict in representing the natural forms"; "the first glance at a picture is the crucial one"; "black and white, as developing form, are the best of colours"; "drawing is the foundation of a painter's work, but drawing from life in the nude should only be essayed by well-practised men, as the real is often wanting in beauty."

Of pupils Robusti had very few; his two sons and Martin de Vos of Antwerp were among them. Domenico Robusti (1562-1637), whom we have already had occasion to mention, frequently assisted his father in the groundwork of great pictures. He himself painted a multitude of works, many of them on a very large scale; they would at best be mediocre, and, coming from the son of Tintoret, are exasperating; still, he must be regarded as a considerable sort of pictorial practitioner in his way.

We conclude by naming a few of the more striking of Tintoret's very numerous works not already specified in the course of the article. In Venice—(S. Giorgio Maggiore), a series of his later works, the Gathering of the Manna, Last Supper, Descent from the Cross, Resurrection, Martyrdom of St Stephen, Coronation of the Virgin, Martyrdom of St Damian; (S. Francesco della Vigna) the Entombment; (the Frari) the Massacre of the Innocents; (S. Cassiano) a Crucifixion, the figures seen from behind along the hill slope; (St Mark's) a mosaic of the Baptism of Christ,—the oil-painting of this composition is in Verona. In Milan (the Brera), St Helena and other saints. In Florence (Pitti Gallery), Venus, Vulcan, and Cupid. In Cologne (Wallraff-Richartzs Museum), Ovid and Corinna. In Augsburg (the town-hall), some historical pictures, which biographers and tourists alike have unaccountably neglected,—one of the siege of a fortified town is astonishingly fine. In England—(Hampton Court), Esther and Ahasuerus, and the Nine Muses; (the National Gallery) Christ washing Peter's Feet, a grand piece of colour and execution, not greatly interesting in other respects, also a spirited smallish work, St George and the Dragon.

The writer who has done by far the most to establish the fame of Tintoret at the height which it ought to occupy is Professor Ruskin in his *Stones of Venice* and other books; the depth and scope of the master's power had never before been adequately brought out, although his extraordinary and somewhat arbitrarily used executive gift was acknowledged. Ridolfi (*Meraviglie dell'Arte*) gives interesting personal details: the article by Dr. Janitschek in *Kunst und Künstler* (1876) is a solid account. For an English reader the most handy narrative is that of Mr W. R. Osler (*Tintoretto*, 1879), in the series entitled "The Great Artists." Here the biographical facts are clearly presented; the aesthetic criticism is enthusiastic but not perspicuous. (W. M. R.)

ROC, or more correctly RUKH, a fabulous bird of enormous size which carries off elephants to feed its young. The legend of the roc, familiar to every one from the *Arabian Nights*, was widely spread in the East; and in later times the home of the monster was sought in the direction of Madagascar, whence gigantic fronds of the *Raphia* palm very like a quill in form appear to have been brought under the name of roc's feathers (see Yule's

Marco Polo, bk. iii. ch. 33, and *Academy*, 1884, No. 620). Such a feather was brought to the Great Khan, and we read also of a gigantic stump of a roc's quill being brought to Spain by a merchant from the China seas (Abu Hâmîd of Spain, in Damiri, *s.v.*). The roc is hardly different from the Arabian 'ankâ, already mentioned under PHOENIX; it is also identified with the Persian *simurgh*, the bird which figures in Firdausi's epic as the foster-father of the hero Zal, father of Rustam. When we go farther back into Persian antiquity we find an immortal bird, *amru*, or (in the *Minô-khîradh*) *sinamrû*, which shakes the ripe fruit from the mythical tree that bears the seed of all useful things. Sinamrû and simurgh seem to be the same word. In Indian legend the *garûda* on which Vishnu rides is the king of birds (Benfey, *Pantschatantra*, ii. 98). In the Pahlavi translation of the Indian story as represented by the Syrian *Kalîlag and Damnag* (ed. Bickell, 1876), the simurgh takes the place of the garûda, while Ibn al-Mokaffa' (*Calila et Dimna*, ed. De Sacy, p. 126) speaks instead of the 'ankâ. The later Syriac, curiously enough, has *behemoth*,—apparently the behemoth of Job transformed into a bird.

For a collection of legends about the roc, see Lane's *Arabian Nights*, chap. xx. notes 22, 62, and Yule, *ut supra*. Also see Bochart, *Hieroz.*, bk. vi. ch. xiv.; Damiri, i. 414, ii. 177 sq.; Kazwini, i. 419 sq.; Ibn Batûta, iv. 305 sq.; Spiegel, *Iran. Alierthumsk.*, ii. 118.

ROCH, St (Lat. *Rochus*; Ital. *Rocco*; Span. *Rogue*; Fr. *Roch* or *Rogue*), according to the *Roman Breviary*, was a native of Montpellier, France. The name of his father was John and that of his mother Franca or Libera. He was born with the mark of a red cross upon his person, and this was at once interpreted as signifying his future eminence. In his twelfth year he began to manifest strict asceticism and great devoutness, and on the death of his parents in his twentieth year he gave all his substance to the poor and joined the Franciscan Tertiaries. Coming to Italy during an epidemic of plague, he was very diligent in tending the sick in the public hospitals at Aquapendente, Cesena, and Rome, and effected many miraculous cures by prayer and simple contact. After similar ministries at Piacenza he himself fell ill, and would have perished as he passed through the forest had not the dog of a certain nobleman daily supplied him with bread. On his return to Montpellier he was arrested as a spy and thrown into prison, where he died, having previously obtained from God this favour, that all plague-stricken persons invoking him should be healed. The date of his death was 16th August 1327, in the thirty-second year of his age. During the sittings of the council of Constance in 1414, when the city was visited with the plague, the efficacy of St Roch's intercession was "most manifestly" experienced. His remains were removed in 1385 to Venice, where they now lie. He is commemorated, chiefly in Italy and France, as the patron of the sick, and especially of the plague-stricken.

ROCHDALE, a municipal and parliamentary borough of south-east Lancashire, is situated on the river Roch and on the Lancashire and Yorkshire railway, 11 miles north-north-east of Manchester and 12 east of Bolton. By means of the Rochdale Canal, extending from the duke of Bridgewater's canal, Manchester, to the Calder and Hebble navigation at Sowerby Bridge, it has water communication with the most important towns in the north of England. Within recent years the town has largely increased. Though inhabited chiefly by the working classes, the streets generally are spacious and regular. The sanitary arrangements are very satisfactory, the main drainage having been executed on a very large scale. The gas-works and waterworks are in the hands of the corporation, which also erected public baths in 1868. There is a public cemetery belonging to the corporation, and also a public

park 12 acres in extent. The parish church of St Chad, occupying the high grounds overlooking the town, is built on the site of a church which was erected in the 12th century. The town-hall is a very extensive and elaborate structure in the Decorated Gothic style, and had originally a tower surmounted by a gilded spire 140 feet in height, which was destroyed by fire in 1883. The building, completed in 1871 at a cost of £150,000, includes a large hall for public meetings and various municipal rooms. For the free public library, with about 40,000 volumes, a new building was opened in 1884. Of the educational charities the principal are the Archbishop Parker free grammar-school, founded in 1565, and the free English school. Among the other public institutions are the infirmary (lately much enlarged), the literary and scientific society, and the art society. The staple manufactures are those of woollens and cottons. There are, besides, foundries, iron-works, and machine-factories. Coal and stone are obtained extensively in the neighbourhood of the town. Rochdale was the birthplace of the co-operative movement. The town was first incorporated in 1856 and divided into three wards, but when the area of the municipal borough was extended and made coextensive with the parliamentary borough it was divided into ten wards, governed by a mayor, ten aldermen, and thirty councilmen. Rochdale has returned one member to the House of Commons since the Reform Act of 1832. The population of the borough (area, 4172 acres) in 1871 was 63,485, and in 1881 it was 68,866.

In early times Rochdale was situated entirely in the township of Castleton, where at one time stood the castle which gave its name to the township. Near the town are the remains of a Roman road leading over the Blackstone Edge Hills, which separate Lancashire and Yorkshire. The name Rochdale appears in Domesday Book as *Recedam*, and it was subsequent to the Norman Conquest that the town began to spread into the valley of the Roch. From the time of William the Conqueror the manor and estates were held by the De Lacys, but after some centuries they became merged in the crown. By Elizabeth they were bestowed on Sir John Byron, and in 1823 they were sold by Lord Byron the poet to James Dearden, in whose family they now remain. The town obtained a charter for a market in the reign of Richard I.; this charter was confirmed by Henry III., who added the privilege of holding an annual fair.

ROCHEFORT, a town of France, the chef-lieu of an arrondissement of the department of Charente Inférieure and of the fourth maritime prefecture, lies on the right bank of the Charente, 9 miles from the Atlantic, and is built partly on the side of a rocky hill and partly on old marshland, which renders the position unhealthy. The town is laid out with great regularity in chess-board fashion. The fortifications are sufficient merely to prevent it being taken by surprise. By rail it is connected with La Rochelle (18 miles north-north-west), Niort, and Saintes. There are both a naval and a commercial harbour. The former has the advantage of deep anchorage well protected by batteries at the mouth of the river, and the roadstead is perfectly safe. The windings of the channel, however, between Rochefort and the sea, and the bar at the entrance render navigation dangerous. This harbour and arsenal, which are separated from the town by a line of fortifications with three gates, contain large covered building yards (where eighteen vessels of the first class may be upon the stocks at once), eleven slips, three repairing docks, and on the right bank of the Charente in the Gardette meadows a large timber basin capable of floating 1,766,000 cubic feet of timber. Besides the various establishments implied in the name, the arsenal is the seat of a ropewalk dating from 1666, a school of navigation and pilotage, a signal-tower 98 feet high (once attached to a church), the offices of the maritime prefecture, the navy commissariat, a park of artillery, and various boards of direction connected with the navy. About 5000 or 6000

men are usually employed in the arsenal. Other Government establishments at Rochefort are barracks for infantry, artillery, and marines, a provision factory, and the naval hospital (800 beds) and school of medicine. In the grounds of this last institution is an artesian well, sunk in 1862-66 to a depth of 2800 feet and yielding water at a temperature of 107° Fahr. The commercial harbour, higher up the river than the naval harbour, has two basins with an aggregate area of 5 acres and 3400 feet of quays, and a third basin is being constructed (1885) 25 acres in extent with 3800 feet of quays, capable of admitting large vessels on every day of the year. The town has good public and botanic gardens, and the Place Colbert contains an allegorical group representing the ocean and the Charente mingling their waters. Besides ship-building, which forms the staple industry of Rochefort, sailcloth and furniture are the local manufactures, and hemp for cordage is grown in the vicinity. Along with Tonnay-Charente, 4 miles higher up, Rochefort has a trade in brandies, salt, grain, flour, cattle, horses, fish, colonial wares, timber, and coal. There is regular steamboat communication with the United Kingdom. In 1882 285 vessels (128,570 tons) entered and 270 (123,501) cleared. The population of the town was 26,022 in 1881 (27,854 in the commune).

The lordship of Rochefort, held by powerful nobles as early as the 11th century, was united to the French crown by Philip the Fair in 1303; but it was alternately seized in the course of the Hundred Years' War by the English and the French, and in the wars of religion by the Catholics and Protestants. Colbert having in 1665 chosen Rochefort as the seat of a repairing port between Brest and the Gironde, the town rapidly increased in importance: by 1674 it had 20,000 inhabitants; and, when the Dutch admiral Tromp appeared at the mouth of the river with seventy-two vessels for the purpose of destroying the new arsenal, he found the approaches so well defended that he gave up his enterprise. It was at Rochefort that the naval school now transferred to Brest was originally founded. The town continued to flourish in the later part of the 17th century. In 1690 and in 1703 it escaped from the attempts made by the English to destroy it. Its fleet under the command of La Gallissonnière, a native of the place, defeated Admiral Byng in 1755, and did good service in the wars of the republic. But the destruction of the French fleet by the English in 1809 in the roadstead of Île d'Aix, the preference accorded to the harbours of Brest and Toulon, and the unhealthiness of its climate have seriously interfered with the prosperity of the place. The convict establishment founded at Rochefort in 1777 was suppressed in 1852.

ROCHEFOUCAULD. See **LA ROCHEFOUCAULD**.

ROCHELLE, LA, a town and seaport of France, the chef-lieu of the department of Charente-Inférieure, is situated on the Atlantic coast in 46° 9' N. lat., 296 miles by rail south-west of Paris. Its fortifications, which were constructed by Vauban, have a circuit of 3½ miles with seven gates. In population (20,028 in 1881; 22,464 in the commune) it ranks after Rochefort. The harbour, one of the safest and most accessible on the coast, comprises an outer harbour, a tidal basin, a wet dock, and a graving dock. The outer harbour is still protected by the dry stone mole, about a mile long, constructed by Richelieu. The wet dock (7 acres) is capable of receiving ships of 1000 tons. Behind these is the Maubec basin, the water of which along with that of the Niort Canal helps to scour the port and navigable channel. On the fortifications towards the sea are three towers, of which the oldest (1384) is that of St Nicholas. The apartment in the first story was formerly used as a chapel. The chain tower (1476) was at one time connected with that of St Nicholas by a great pointed arch. The lantern tower (1475-76), seven stories high, affords a fine view of the town, the roadstead, and the surrounding islands, and at present is used as a military prison. Of the ancient gateways only one has been preserved in its entirety, that of the "grosse horloge," a huge square tower of the 14th or 15th century,

the corner turrets of which have been surmounted with trophies since 1746. The cathedral of La Rochelle (St Louis or St Bartholomew) is a heavy Grecian building (1742-1862) with a dome above the transept, erected on the site of the old church of St Bartholomew, destroyed in the 16th century and now represented by a solitary tower dating from the 14th century. Externally the town-house (1486-1607) has the appearance of a fortress in the Gothic style and internally that of a Renaissance palace. The belfries are beautifully decorated with carved work, and the council-chamber, where the mayor Guiton presided during the siege, is now adorned by his statue. In the old episcopal palace (which was in turn the residence of Sully, the prince of Condé, Louis XIII., and Anne of Austria, and the scene of the marriage of Alphonso VI. of Portugal with a princess of Savoy) accommodation has been provided for a library of 25,000 volumes, a collection of records going back to the 13th century, and a museum founded in 1842 by the society of the Friends of the Arts. Other buildings of note are an arsenal, an artillery museum, a large hospital, a special Protestant hospital, a military hospital, and a lunatic asylum for the department. In the public gardens there is a museum of natural history. Mediæval and Renaissance houses still give a peculiar character to certain districts of the town: several have French, Latin, or Greek inscriptions of a moral or religious turn and in general of Protestant origin. Of these old houses the most interesting is that of Henry II. or Diana of Poitiers. The parade-ground, which forms the principal public square, occupies the site of the castle, demolished in 1590. Some of the streets have side-arcades; the public wells are fed from a large reservoir in the Champ de Mars; and among the promenades are the Cours des Dames with the statue of Admiral Duperré (1869), and, outside, the tree-planted ramparts and the Mail, a beautiful piece of greensward. In this direction are the sea-bathing establishments. La Rochelle, besides a celebrated manufactory of barrels, contains saw-mills, copper and iron foundries, and factories for patent fuel made out of coal dress. In 1882 465 vessels (225,449 tons) entered and 431 (215,820) cleared. Coals from England and iron-ore from Spain are among the staple imports. In the neighbourhood the principal industries are getting salt from the marshes and rearing oysters and mussels.

La Rochelle existed at the close of the 10th century under the name of Rupella. In 1199 it received a communal charter from Eleanor, duchess of Guienne, and it was in its harbour that John Lackland disembarked when he came to try to recover the domains seized by Philip Augustus. Captured by Louis VIII. in 1224, it was restored to the English in 1360 by the treaty of Brétigny, but it shook off the yoke of the foreigner when Duguesclin recovered Saintonge. During the 14th, 15th, and 16th centuries La Rochelle, then an almost independent commune, was one of the great maritime cities of France. From its harbour in 1402 Jean de Béthencourt set out for the conquest of the Canaries, and its seamen were the first to turn to account the discovery of the New World. The salt-tax provoked a rebellion at Rochelle which Francis I. had to come to repress in person; in 1568 the town secured exemption by the payment of a large sum. At the Reformation La Rochelle early became one of the chief centres of Calvinism, and during the religious wars it armed privateers which preyed on Catholic vessels in the Channel and the high seas. In 1571 a synod of the Protestant churches of France was held within its walls under the presidency of Beza for the purpose of drawing up a confession of faith. After the massacre of St Bartholomew, La Rochelle held out for six and a half months against the Catholic army, which was ultimately obliged to raise the siege after losing more than 20,000 men. The peace of 24th June 1573, signed by the people of La Rochelle in the name of all the Protestant party, granted the Calvinists full liberty of worship in several places of safety. Under Henry IV. the town remained quiet, but under Louis XIII. it put itself again at the head of the Huguenot party. Its vessels blockaded the mouth of the Gironde and stopped the commerce of Bordeaux, and also seized the islands of Ré and Oléron and several vessels of the royal fleet. It was then that Richelieu resolved to subdue the town once for all. In spite of the assistance rendered by the English

troops under Buckingham and in spite of the fierce energy of their mayor Guiton, the people of La Rochelle were obliged to capitulate after eight months' siege (October 1628). During this investment Richelieu raised the celebrated mole which cut off the town from the open sea. La Rochelle then became the principal port for the trade between the mother-country of France and the colony of Canada. But the revocation of the Edict of Nantes deprived it of 3000 of its most industrious inhabitants, and the loss of Canada by France completed the ruin of its commerce. Its privateers, however, still maintained a vigorous struggle with the English during the republic and the empire.

Among the men of mark born at La Rochelle may be mentioned Jean Guiton, Tallemant des Réaux, Réaumur the physicist, Admiral Duperré, Bonpland the botanist, and the painters Fromentin and Bouguereau.

ROCHELLE SALT. See TARTARIC ACID.

ROCHESTER, an episcopal city and municipal and parliamentary borough of Mid-Kent, is situated on the Medway, on the Medway Canal, and on the London, Chatham, and Dover and the South-Eastern railway lines, 33 miles east of London, contiguous to Chatham and Strood. Here the river is crossed by a railway bridge and by an iron swing bridge for carriage traffic, erected to take the place of a stone bridge destroyed in 1856. The present bridge occupies the site of that which spanned the Medway before the Conquest. On the eminence overlooking the right bank of the river and commanding a wide view of the surrounding country are the extensive remains of the Norman castle which is generally supposed to have been built by Gundulph, bishop of Rochester, towards the close of the 11th century, and which was besieged by King John, by Simon de Montfort in the reign of Henry III., and in the reign of Richard II. by a party of rebels during the insurrection of Wat Tyler. It was repaired by Edward IV., but soon afterwards fell into decay, although the massive keep is still in good preservation. The cathedral was originally founded by Augustine in 604, but was partially destroyed by the Danes, and was rebuilt by Bishop Gundulph in the beginning of the 12th century. Though a comparatively small building, being only 310 feet in length and 68 in breadth at the nave, it is of considerable architectural interest, the most remarkable feature being the Norman west front with a richly sculptured door. There is a large number of monuments of great antiquity. In the garden of the deanery there are portions of the wall of St Andrew's priory, founded about the same time as the cathedral. Among the principal public buildings of a secular character are the town-hall (1687), the corn exchange (1871), the county court offices (1862), the working men's institute (1880), and the Richard Watts's almshouses, in the Tudor style. Besides these almshouses there are a number of other charities. The principal schools are the cathedral grammar-school, founded in the reign of Henry VIII., and the Williamson mathematical school, formerly for the sons of freemen, but now open to all. The oyster fishing is of some importance, and there is a considerable shipping trade, a quay and landing-place having been erected by the corporation at great expense. In 1883 the number of vessels that entered the port was 5969 of 855,019 tons burden, and the number that cleared 5496 of 709,040 tons. There is a large steam-engine manufactory. Rochester returned two members to parliament down to 1885, when it was deprived of one. The population of the borough (area,¹ 2909 acres) in 1871 was 18,352, and in 1881 it was 21,307; this includes 5395 persons in the town of Strood, situated on the opposite side of the Medway.

Rochester was the *Durobrivæ* of the Romans, and was intersected by the Roman Watling Street from Canterbury. It was formerly surrounded with walls, of which there are still a few remains. It was the foundation of the cathedral by Ethelbert that first raised it to importance. By the Saxons it was named *Hrofe-ceastre*, which was gradually corrupted into the present name. In 676 it

¹ The parliamentary borough also includes 11,768 acres of tidal water and foreshore along the river Medway.

1766 he succeeded his former chief as first lord of the treasury and prime minister. Then followed many years of fruitless opposition to the king's personal authority as exhibited through his ministers, but at last, on 27th March 1782, Lord Rockingham again became prime minister with Fox and Shelburne as secretaries of state. This time he enjoyed office for but a few weeks, for he died on 1st July 1782. A few words from his epitaph by Burke deserve quotation as giving the reason of the predominance of such an ordinary man as Lord Rockingham over a party abounding in men of great abilities: "A man worthy to be held in esteem, because he did not live for himself. . . . He far exceeded all other statesmen in the art of drawing together, without the seduction of self-interest, the concurrence and co-operation of various dispositions and abilities of men, whom he assimilated to his character and associated in his labours."

See *Memoirs of the Marquis of Rockingham and his Contemporaries* by George Thomas, Earl of Albemarle, 2 vols., 1852, and such biographical works as Macknight's *Life of Burke*, Lord E. Fitzmaurice's *Life of Lord Shelburne*, &c.

ROCK ISLAND, a city of the United States, the capital of Rock Island county, Illinois, is situated opposite Davenport on the left bank of the Mississippi, about 3 miles above the mouth of the Rock river and at the foot of the Upper Rapids, which extend for about 16 miles. Distant by rail 181 miles west of Chicago and 247 miles north of St Louis, Rock Island is one of the great centres of railroad and river traffic. With Davenport (in Iowa) it is connected by a two-story road and railway bridge constructed by the Government in 1870. Among the public buildings are a large public library and St Augustana College, founded by the Swedish Lutherans. Glass-works, a plough factory, a distillery, flour-mills, and a stove factory are the principal industrial establishments. The city, however, is best known from the great national arsenal situated on the island from which it derives its name. This island is a ridge of limestone rock about 3 miles long and with an area of 960 acres. As the site of Fort Armstrong it became known in the Black Hawk War; the prison was used for the detention of Confederate prisoners during the Civil War; and since that date the Government has constructed the present extensive works, intended to be the central United States armoury. There are ten vast stone workshops, each with a stone house in the rear, as well as officers' quarters, offices, &c. The population of Rock Island city was 5130 in 1860, 7890 in 1870, and 11,659 in 1880. Its charter dates from 1849.

ROCKLAND, a city and seaport of the United States, county town of Knox county, Maine, is situated 60 miles by rail east-north-east of Portland on Owl's Head Bay, an inlet of Penobscot Bay. It was incorporated in 1854, has an area of 7000 acres and a sea frontage of about $4\frac{1}{2}$ miles, and numbered 7599 inhabitants in 1880 (in 1870 7074). Lime-burning is the staple trade (1,000,000 barrels per annum). The adjacent islands—Dix Island, Hurricane Island, &c.—are known by their granite quarries. Water for the city is obtained from Lake Chickawaukie.

ROCKY MOUNTAINS. See UNITED STATES.

ROCROI, a town of France, the chef-lieu of an arrondissement in the department of Ardennes, lies 15 miles in a straight line north-north-west of Mézières and within 2 miles of the Belgian frontier, at a height of 1083 feet above the sea. As a fortified place it commands the Ardennes plateau between the valley of the Meuse and the headwaters of the Oise. The present fortifications were constructed by Vauban. In 1881 the population was 1649 (commune 2977).

This spot, originally called Croix-de-Rau or Rau Croix, was fortified in the 16th century and besieged by the imperialists in 1555. Invested by the Spaniards in 1643, it was relieved by the

young duke of Enghien (afterwards the Great Condé) after a brilliant victory. Captured in 1658 by the same duke, then in the Spanish service, it was not restored to France till the treaty of the Pyrenees in 1659. In 1815 Rocroi was besieged for a month by the allies.

RODBERTUS, KARL JOHANN (1805-1875), by some considered to be the founder of scientific socialism, was born at Greifswald on 12th August 1805, his father being a professor at the university there. He studied law at Göttingen and Berlin, thereafter engaging in various legal occupations; and, after travelling for some time, he bought the estate of Jagetzow in Pomerania, whence his name of Rodbertus-Jagetzow. In 1836 he settled on this estate, and henceforward devoted his life chiefly to economic and other learned studies, taking also some interest in local and provincial affairs. After the revolution of March 1848 Rodbertus was elected member of the Prussian national assembly, in which body he belonged to the left centre; and for fourteen days he filled the post of minister of public worship and education. He sat for Berlin in the second chamber of 1849, and moved the adoption of the Frankfort imperial constitution, which was carried. When the system of dividing the Prussian electorate into three classes was adopted, Rodbertus recommended abstention from voting. His only subsequent appearance in public life was his candidature for the first North German diet, in which he was defeated. His correspondence with Lassalle was an interesting feature of his life. At one time Rodbertus had some intention of forming a "social party" with the help of the conservative socialist Rudolf Meyer and of Hasenclever, a prominent follower of Lassalle; but no progress was made in this. Rodbertus was neither disposed nor qualified to be an agitator, being a man of a quiet and critical temperament, who believed that society could not be improved by violent changes, but by a long and gradual course of development. He warned the working men of Germany against connecting themselves with any political party, enjoining them to be a "social party" pure and simple. He died on 8th December 1875.

The general position of Rodbertus was "social, monarchical, and national." With his entire soul he held the purely economic part of the creed of the German social-democratic party, but he did not agree with their methods, and had no liking for the productive associations with state help of Lassalle. He regarded a socialistic republic as a possible thing, but he cordially accepted the monarchic institution in his own country and hoped that a German emperor might undertake the rôle of a social emperor. He was also a true patriot and was proud and hopeful of the career that lay before the regenerated empire of Germany. The basis of the economic teaching of Rodbertus is the principle laid down by Adam Smith and Ricardo and insisted on by all the later socialists, that labour is the source and measure of value. In connexion with this he developed the position that rent, profit, and wages are all parts of a national income produced by the united organic labour of the workers of the community. Consequently there can be no talk of the wages of labour being paid out of capital; wages is only that part of the national income which is received by the workmen, of a national income which they have themselves entirely produced. The wages fund theory is thus summarily disposed of. But the most important result of the theory is his position that the possession of land and capital enables the landholders and capitalists to compel the workmen to divide the product of their labour with those non-working classes, and in such a proportion that the workers only obtain as much as can support them in life. Thus the iron law of wages is established. Hence also Rodbertus deduces his theory of commercial crises and of pauperism, and in the following way. In spite of the increasing productivity of labour, the workers obtain in general only sufficient to support their class, and therefore a smaller relative share of the national income. But the producers form also the large mass of consumers, and, with the decline of their relative share in the national income, must decline the relative purchasing power of this large class of the people. The growing production is not met by a correspondingly growing consumption; expansion is succeeded by contraction of production, by a scarcity of employment, and a further decline in purchasing power on the part of the workers. Thus we have a commercial crisis bringing with it pauperism as a necessary result. In the meantime the purchasing power of the non-producing capitalists and landholders continues relatively to increase; but, as they have already had enough to buy

all the comforts of life, they spend the more in the purchase of luxuries, the production of which increases.

A fundamental part of the teaching of Rodbertus is his theory of social development. He recognized three stages in the economic progress of mankind: (1) the ancient heathen period in which property in human beings was the rule; (2) the period of private property in land and capital; (3) the period, still remote, of property as dependent on service or desert. The goal of the human race is to be one society organized on a communistic basis; only in that way can the principle that every man be rewarded according to his work be realized. In this communistic or socialistic state of the future land and capital will be national property, and the entire national production will be under national control; and means will be taken so to estimate the labour of each citizen that he shall be rewarded according to its precise amount. An immense staff of state officials will be required for this function. As we have already said, Rodbertus believed that this stage of social development is yet far distant; he thought that five centuries will need to pass away before the ethical force of the people can be equal to it.

From temperament, culture, and social position Rodbertus was averse to agitation as a means of hastening the new era; and, in the measures which he recommends for making the transition towards it he showed a scrupulous regard for the existing interests of the capitalists and landholders. He proposed that those two classes should be left in full possession of their present share of the national income, but that the workers should reap the benefit of the increasing production. To secure them this increment of production he proposed that the state should fix a "normal working day" for the various trades, a normal day's work, and a legal wage, the amount of which should be revised periodically, and raised according to the increase of production, the better workman receiving a better wage. By measures such as these carried out by the state in order to correct the evils of competition would Rodbertus seek to make the transition into the socialistic era.

The economic work of Rodbertus is therefore an attempt made in a temperate and scientific spirit to elucidate the evil tendencies inherent in the competitive system, especially as exemplified in the operation of the iron law of wages. The remedy he proposes is a state management of production and distribution, which shall extend more and more, till we arrive at a complete and universal socialism,—and all based on the principle that as labour is the source of value so to the labourer should all wealth belong. It is therefore an attempt to place socialism on a scientific basis; and he is certainly entitled to be regarded as one of the founders of "scientific socialism" (see SOCIALISM).

The following are the most important works of Rodbertus:—*Zur Erkenntnis unserer staatswirtschaftlichen Zustände* (1842); *Soziale Briefe an von Kirchmann* (1850); *Creditnotiz des Grundbesitzes* (2d ed., 1876); "Der Normal-Arbeitstag," in *Tüb. Zeitschrift* (1878); *Letters to A. Wagner, &c., Tüb. Zeitschrift* (1878-79); *Letters to Rudolf Meyer* (1882). Within recent years Rodbertus has received great attention in Germany, especially from Adolf Wagner (*Tüb. Zeitschrift*, 1878); see also Kozak's work on Rodbertus (1882), and an excellent monograph by G. Adler (Leipzig, 1884).

RODERICK. See SPAIN.

RODEZ, a town of France, chef-lieu of the department of Aveyron and the see of a bishop, 412 miles south of Paris by the railway which continues to Béziers, is built at a height of 2077 feet on a promontory surrounded by the Aveyron, a sub-tributary of the Garonne by the Tarn. In population—14,425 inhabitants (15,333 in the commune) in 1881—it ranks next to the industrial town of Millau. The cathedral was built between 1277 and 1535. A great flamboyant rose window and a gallery in the same style are the chief features of the principal façade. Each transept has a fine Gothic doorway. At the north side of the building rises a tower (erected in the beginning of the 16th century) which ranks by its height as one of the wonders of the south of France, and bears aloft a colossal statue of the Virgin surrounded by the four evangelists. The interior has a fine rood loft and several interesting tombs. The episcopal palace with its collection of sculptured stones; the church of St Amans, in the Romanesque style, but entirely restored externally in the 18th century; and several curious old houses of the 13th, 15th, and 16th centuries, such as the Hôtel d'Armagnac, on the site of the old palace of the counts, also deserve to be mentioned. The ruins of a Roman amphitheatre still exist, and the town is supplied with water by the old Roman aqueduct recently restored.

Rodez, called Segodunum under the Gauls and Ruthena under the Romans, was the capital of a tribe allied to the Arvernians. In the 4th century it adopted the Christian faith and St Amans, its

first bishop, was elected in 401. During the Middle Ages contests were rife between the bishops in the "city" and the counts in the "bourg." The Albigenses were defeated near Rodez in 1210. The countship of Rodez depended in succession on the count of Toulouse, on the king of France, and from the close of the 13th century on the count of Armagnac. From 1360 to 1368 the English held the town. After the confiscation of the estates of the Armagnacs in 1473 it passed to the dukes of Alençon and then to the D'Albrets. Henry IV. finally annexed it to the crown of France. Neither the Protestants nor the Leaguers any more than in earlier days the Albigenses were able to make themselves masters of Rodez.

RODNEY, GEORGE BRYDGES RODNEY, BARON (1718-1792), English admiral, second son of Henry Rodney of Walton-on-Thames, was born there on 19th February 1718. His father had served in Spain under the earl of Peterborough, and on quitting the army obtained command of the king's yacht. George was sent to Harrow when quite young, and on leaving entered the navy. By warrant dated 21st June 1732 he was appointed as volunteer on board the "Sunderland," a fourth-rate. While serving on the Mediterranean station under Admiral Haddock he was made lieutenant in the "Dolphin," his promotion dating 15th February 1739. In 1742 he attained the rank of post-captain, having been appointed to the "Plymouth," 9th November. After minor services of an active character in home waters, he obtained command of the "Eagle," sixty guns, and in this ship took part in Hawke's victory off Ushant, 14th October 1747, over the French fleet under L'Etandière. On that day Rodney gained his first laurels for gallantry, under a chief to whom he was in a measure indebted for subsequent success. On 9th May 1749 he was appointed governor and commander-in-chief of Newfoundland, with the rank of commodore, it being usual at that time to appoint a naval officer, chiefly on account of the fishery interests. Returning home, he was elected M.P. for Saltash in May 1751, and married his first wife, Jane Compton, sister to the earl of Northampton, 3d February 1753. During the Seven Years' War Rodney rendered important service. In 1757 he had a share in the expedition against Rochefort, commanding the "Dublin," seventy-four. Next year, in the same ship, he served under Admiral Boscawen at the taking of Louisbourg (Cape Breton). On 19th May 1759 Rodney became a rear-admiral and was shortly after given command of a small squadron intended to destroy a large number of flat-bottomed boats and stores which were being collected at Havre for an invasion of the English coasts. He bombarded the town for two days and nights without ceasing, and inflicted great loss of war-material on the enemy. In July 1760, with another small squadron, he succeeded in taking many more of the enemy's flat-bottomed boats and in blockading the coast as far as Dieppe. Elected M.P. for Penryn in 1761, he was in October of that year appointed commander-in-chief of the Leeward Islands station, and within the first three months of 1762 had reduced the important island of Martinique, while both St Lucia and Grenada had surrendered to his squadron. During the siege of Fort Royal his seamen and marines rendered splendid service on shore. At the peace of 1763 Admiral Rodney returned home, having been during his absence made vice-admiral of the Blue and voted the thanks of both Houses of Parliament.

In 1764 Rodney was created a baronet by patent of 21st January, and the same year he married Henrietta, daughter of John Clies of Lisbon. From 1765 to 1770 he was governor of Greenwich Hospital, and on the dissolution of parliament in 1768 he successfully contested Northampton at a ruinous cost. When appointed commander-in-chief of the Jamaica station in 1771 he lost his Greenwich post, but a few months later received the office of rear-admiral of Great Britain. Till 1774 he held the Jamaica com-

mand, and during a period of quiet was active in improving the naval yards on his station. Sir George struck his flag with a feeling of disappointment at not obtaining the governorship of Jamaica, and was shortly after forced to settle in Paris. Election expenses and losses at play in fashionable circles had shattered his fortune and now broke up his family till the eve of war with France. In February 1778, having just been promoted admiral of the White, he used every possible exertion to obtain a command from the Admiralty, to free himself from his money difficulties. By May he had, through the splendid generosity of his Parisian friend Maréchal Biron, effected the latter task, and accordingly he returned to London with his children. Sir George was enabled to remit at once to his benefactor the full loan, and it is worthy of record that the English Government in later years awarded pensions to the maréchal's daughters in recognition of their father's chivalrous act.¹ That an attempt was made by the French ministry during the war crisis to seduce Rodney into accepting high rank in the French navy is undeniable from the evidence we possess, but the details of the common version must be accepted with reserve, excepting the undoubted instant rejection of the offer. To the English cabinet the honour of both Rodney and Biron remained untarnished, if we may judge of the former by his letters, public and private, and of the latter by the pension awarded to his relatives.²

Sir George was appointed once more commander-in-chief of the Leeward Islands, 1st October 1779, but did not sail till 29th December. He captured a Spanish convoy bound to Cadiz on 8th January 1780, and eight days later defeated the Spanish admiral Don Juan de Langara off Cape St Vincent, taking or destroying seven ships. On 17th April an action, which, owing to the carelessness of some of Rodney's captains, was indecisive, was fought off Martinique with the French admiral Guichen. Rodney, acting under orders, captured the valuable entrepôt of St Eustatius, and by his strong measures for stopping illegal and contraband trade evoked an attempt at censure on the part of his political opponents. After a few months in England, recruiting his health and defending himself in parliament, Sir George returned to his command in February 1782, and a running engagement with the French fleet on 9th April led up to his crowning victory off Dominica, when on 12th April with thirty-five sail of the line he defeated Comte de Grasse, who had thirty-three sail. The French inferiority in numbers was more than counterbalanced by the greater size and superior sailing qualities of their ships, yet five were taken and one sunk, after eleven hours' fighting. This important battle saved Jamaica and ruined French naval prestige, while it enabled Rodney to write— "Within two little years I have taken two Spanish, one French, and one Dutch admirals." A long and wearisome controversy exists as to the originator of the manoeuvre of "breaking the line" in this battle, but the merits of the victory have never seriously been affected by any difference of opinion on the question. A shift of wind broke the French line of battle, and advantage was taken of this by the English ships in two places.

Rodney arrived home in August to receive unbounded honour from his country. He had already been created Baron Rodney of Rodney Stoke, Somerset, by patent of 19th June 1782, and the House of Commons had voted him a pension of £2000 a year. From this time he led a

quiet country life till his death, which occurred on 24th May 1792, in London, while on a visit to his son. Next to Nelson we may fairly place Rodney, not only because of his well-merited successes, but for masterly decision and confident boldness in grappling with fleets of the three chief maritime states of Europe while in the plenitude of their power. He fought his equals in naval science, but conquered by superior practical skill.

See General Mundy, *Life and Correspondence of Admiral Lord Rodney*, 2 vols., 1830; Rodney letters in 9th Report of Hist. MSS. Com., pt. iii.; "Memoirs" in *Naval Chronicle* i. 353-393; and Charnock, *Biographia Navalis* v. 204-228. Lord Rodney published in his lifetime (probably 1789) *Letters to His Majesty's Ministers, &c., relative to St Eustatius, &c.*, of which there is a copy in the British Museum. Most of these letters are printed in Mundy's *Life*, vol. ii., though with many variant readings. (G. F. H.)

RODOSTO, a town of European Turkey, in the sandjak of Tekfur Daghi or Rodosto in the vilayet of Adrianople (Edirne), is situated on the coast of the Sea of Marmora about midway between Gallipoli and Constantinople. Its picturesque bay is enclosed by the great promontory of Combos, a spur about 2000 feet in height from the hilly plateau to the north, and round about the town are stately cypress groves. The church of Panagia Rhevmatocratisa contains the graves, with long Latin inscriptions, of the Hungarian exiles of 1696. Rodosto has long been a great depôt for the produce of the Adrianople district, but its trade has suffered considerably since Dedeagatch became the terminus of the railway up the Maritza. In 1880 the value of exports and imports was £230,824. The population, formerly about 30,000, was in 1840 about 10,000, and at present (1885) may be estimated at 17,000, about half Turks, a quarter Armenians, and the remainder Greeks, Jews, and Latins.

Rodosto is the ancient Rhædestus or Bisanthe, said to have been founded by Samians. In Xenophon's *Anabasis* it is mentioned as in the kingdom of the Thracian prince Seuthes. Its restoration by Justinian is chronicled by Procopius. In 813 and again in 1206 it was destroyed by the Bulgarians, but it continues to appear as a place of considerable note in later Byzantine history, being captured and recaptured in successive wars.

RODRIGUEZ, an island in the Indian Ocean in 19° 41' S. lat. and 63° 23' E. long., which, after the Seychelles, forms since 1814 the most important dependency of the British colony of Mauritius, from which it is distant 344 nautical miles. It is the easternmost of all the islands considered as belonging to Africa. With a length of 13 miles east and west and a breadth of 3 to 6 north and south it has an area estimated at 42½ square miles. On all sides it is surrounded by a coral reef, which on the north and south forms a large flat area partly dry at low water. The island proper was long believed to consist of granite overlaid with limestone and other modern formations, and thus it was regarded as a striking exception to the rule that all mid-ocean islands are of volcanic origin, and served in the hands of Peschel and others as a proof of the former existence in the Indian Ocean of the hypothetical continent of Lemuria. The investigations of the Transit of Venus Expedition have shown that it is built up of "doleritic lavas which have been poured out at a considerable number of orifices," now difficult to identify, at successive periods of uncertain date. The lavas are rich in olivine. In some places, as in the Cascade Valley, the disintegration of the rocks has produced beds of earthy clays varying in colour from a dull brick red to a liver brown, and forming a prominent feature in the landscape. A central ridge of considerable elevation (Grande Montagne, 1140 feet) runs through the island from east to west, sending off a variety of spurs (Le Piton, 1160 feet). Deep-cut river valleys, often interrupted by cascades, run down in all directions to the sea. On the south-west there is a large plain of coralline limestone, remarkable for the caves of all sizes (some beautifully stalactitic) with which it is riddled.

¹ See Barrow's *Life of Anson*, pp. 328-329.

² See *Naval Chronicle*, 1799, i. 369-370; Mundy, *Life of Rodney*, i. 183; *United Service Journal*, 1830, pt. ii. pp. 37-38, for divergent evidence about the French offer of service. See also *Academy*, 4th October 1884, for the identification of a letter which perhaps bears upon Sir G. Rodney's prospects in 1778.

Along the north and west coast there are on the reef a number of islands of volcanic origin; those on the south-east are all of coralline limestone or sand. There are only two passages through the reef available for large vessels,—these leading respectively to Port Mathurin and to Port South-East. Rodriguez is comparatively arid; and the streams are as short-lived for the most part as they are beautiful. The climate is like that of Mauritius, but more subject to hurricanes during the north-west monsoon (November to April).

About 1845 the population of Rodriguez was about 250 persons. The original nucleus consisted of slaves from Mauritius, and recruits arrived from Madagascar and the African continent. By 1871 they had increased to 1108 and by 1881 to 1436. The island is governed by a civil commissioner, who is also a police magistrate. Capitalists from Mauritius are beginning to pay attention to the natural advantages of the island. A carriage road has been constructed from Mathurin to Gabriel, the only other village, where the Roman Catholic priests have their chapel and residence.

When originally discovered and down into the 17th century Rodriguez was clothed with fine timber trees; but goats, cattle, and bush-fires have combined to destroy the great bulk of the old vegetation, and the indigenous plants have in many cases been ousted by intrusive foreigners. When the island was in French possession many settlers cultivated large estates, and fortunes were realized; but with the liberation of the slaves the area of cultivation decreased, and it is now of very limited extent. The staple crop is the sweet potato; and manioc, maize, millet, and rice grow well, but are not much cultivated. Wheat is seldom seen, mainly because of the parakeets and the Java sparrows. Beans (*Phaseolus lunatus*), lentils, gram (*Cicer arietinum*), dholl (*Cajanus indicus*), and ground-nuts are all grown to a certain extent in spite of the ravages of the rats (Balfour). Mangoes, bananas, guavas, pine-apples, custard-apples, and especially oranges, citrons, and limes, are the fruits that flourish best. Of the timber trees the most common are *Eleodendron orientale*, much used in carpentry and for pirogues, and *Latania Verschaffeltii* (Leguat's plantane). At least two species of screw-pine (*Pandanus heterocarpus*, Balf. fil. and *P. tenuifolius*) occur freely throughout the island. The total number of known species, according to Professor I. B. Balfour, is 470, belonging to 85 families and 293 genera; and of these 297 are phanerogamous and 173 cryptogamous. The families represented by the greatest number of species are Gramineæ (21 indigenous, 6 introduced), Leguminosæ (14 ind., 15 intr.), Convolvulaceæ (11 ind., 4 intr.), Malvaceæ (9 ind.), Rubiaceæ (8 ind.), Cyperaceæ (8 ind.), Euphorbiaceæ (8 ind.), Liliaceæ (6 ind.), Compositæ (5 ind., 6 intr.). *Mathurina penduliflora* (Turneraceæ) is interesting, as its nearest congener is in Central America, and the family has not hitherto been found in the Mascarenes. Of 33 species of mosses 17 are peculiar. Variability of species and heterophylly are characteristic of the flora to quite an unusual degree. To the naturalist Rodriguez is as interesting as it is to the botanist. At present the only indigenous mammal is a species of fruit-eating bat (*Pteropus rodericensis*), and the introduced species are such familiar creatures as the pig, rabbit, rat, mouse, &c.; but down to a recent period the island was the home of a very large land-tortoise (*Testudo Vosmaeri* or *rodericensis*), and its limestone caves have yielded a large number of skeletons of the dodo-like solitaire (*Pezophaps solitarius*), which still built its mound-like nest in the island in the close of the 17th century, but is now extinct (see vol. iii. p. 732). Of indigenous birds 13 species have been registered. The guinea-fowl (introduced) has become exceedingly abundant, partly owing to a protective game-law; and a francolin (*F. ponticerranus*), popularly a "partridge," is also common. The marine fish-fauna does not differ from that of Mauritius, and the freshwater species, with the exception of *Mugil rodericensis* and *Myxus caeruleus*, are common to all the Mascarenes. Thirty-five species of crustaceans are known. The insects (probably very imperfectly registered) comprise 60 species of Coleoptera, 15 Hymenoptera, 21 Lepidoptera, 15 Orthoptera, and 20 Hemiptera. Forty-nine species of coral have been collected, showing a close affinity to those of Mauritius, Madagascar, and the Seychelles.

Rodriguez or Diego Ruy's Island was discovered by the Portuguese in 1645. In 1690 Duquesne prevailed on the Dutch Government to send a body of French refugees to the Island of Bourbon, at that time, he believed, abandoned by the French authorities. As the refugees, however, found the French in possession they proceeded to Rodriguez, and there eight of their number were landed on 30th April 1691 with a promise that they should be visited by their compatriots within two years. The two years were spent

without misadventure, but, instead of waiting for the arrival of their friends, the seven colonists (for one had meanwhile died) rashly left the island on 8th May 1693 and made their way to Mauritius, where they were treated with great cruelty by the governor. The account of the enterprise left us by Francis Leguat—*Voyages et Aventures* (London, 1708), or, as it is called in the English translation, *A New Voyage to the East Indies* (London, 1708)—is a most garrulous and amusing narrative, and was for a long time almost the only source of information about Rodriguez. His description of the solitaire is of course unique.

See Charles Grant, *Hist. of Mauritius and the Neighbouring Islands*, 1801; Higgin, in *Jour. R. G. Soc.*, London, 1849; the Reports of the results of the Transit of Venus Expedition, 1874-75, published as an extra volume of *The Philosophical Transactions* (clxviii.), London 1879 (Botany, by I. B. Balfour; Petrology, by N. S. Maskelyne, &c.); Behm, in *Petermann's Mittheilungen*, 1880; *Colonial Office List*, 1884, 1885.

ROE. See DEER, vol. vii. p. 24.

ROE or ROW, SIR THOMAS (1568?-1644), an eminent political agent of the reigns of James I. and Charles I., was born in 1568 (?) at Low Leyton near Wanstead in Essex (being a grandson of Sir Thomas Roe, a well-known lord mayor of London). He was entered as a commoner at Magdalen College, Oxford, in 1593, but shortly afterwards he left the university and, having read for the bar, became esquire of the body to Queen Elizabeth. From James I. he received the honour of knighthood in 1604, and in 1609 he was sent by Prince Henry on a mission to the West Indies, during which he visited Guiana and the river Amazons. As member of parliament in 1614 he supported the principles of Sandys and Whitelocke. His permanent reputation was mainly secured by the success which attended his embassy in 1615-18 to the court at Agra of the Great Mogul (Jahangir, son of Akbar), whose importance had been made known by Sir John Hawkins,—the principal object of the mission being to obtain the protection of an English factory at Surat. Sir Thomas Roe's *Journal*, reprinted in a more or less complete shape in the collections of Purchas, Pinkerton, and Kerr, forms one of the leading authorities for the reign of Jahangir. Appointed ambassador to the Porte in 1621, he filled this difficult position under Osman, Mustapha, and Amurat; and after his return from the East he continued to be employed on various political missions to Poland, Denmark, and other European courts, till in 1641 he was sent by Charles I. to the diet of Ratisbon. Roe died in 1644.

The Society for the Encouragement of Learning proposed to publish a whole series of Roe's papers, but owing to lack of funds only one of the five volumes, edited by Samuel Richardson, ever saw the light—*The Negotiations of Sir Thomas Roe in his Embassy to the Ottoman Porte, 1621-1628* (London, 1740). In regard to his minor publications and manuscript remains see Wood's *Athenæ Oxonienses*; Allibone's *Dictionary of British . . . Authors*; and *Notes and Queries*, vii., viii., ix., and xi. (2d ser.).

ROEBLING, JOHN AUGUSTUS (1806-1869), civil engineer, was born at Mühlhausen, Prussia, 6th June 1806. Soon after his graduation from the polytechnic school at Berlin he removed to the United States, and in 1831 entered on the practice of his profession in western Pennsylvania. He established at Pittsburgh a manufactory of wire rope, and in May 1845 completed his first important structure, the suspended aqueduct of the Pennsylvania Canal across the Monongahela river. This was followed by the Monongahela suspension bridge at Pittsburgh and several suspended aqueducts on the Delaware and Hudson Canal. Removing his wire manufactory to Trenton, New Jersey, he began, in 1851, the erection at Niagara Falls of a long span wire suspension bridge with double roadway, for railway and carriage use (see BRIDGE, vol. iv. pp. 338-339), which was completed in 1855. Owing to the novelty of its design, the most eminent engineers, including Stevenson, regarded this bridge as foredoomed to failure; but, with its complete success, demonstrated by long use, the number of suspension bridges rapidly multiplied, the use of wire-ropes instead of chain-cables becoming all but universal. The completion, in 1867, of the still more

remarkable suspension bridge over the Ohio river at Cincinnati, with a clear span of 1057 feet (see CINCINNATI, vol. v. p. 782), added to Roebling's reputation, and his design for the great bridge spanning the East River between New York and Brooklyn was accepted.¹ While personally engaged in laying out the towers for the bridge, Roebling received an accidental injury, which resulted in his death, at Brooklyn, from tetanus, 22d July 1869.

At the time of his death Roebling's work on *Long and Short Span Bridges* (New York, 1869) was in the press. It is devoted to an exposition of his belief that "the principle of suspension will of necessity become the main feature in our future long span railway bridges," and was intended as the initial volume of a series relating to his general theory of bridge construction, with detailed plans and descriptions of the larger works erected by him.

ROEMER, OLE (Latinized OLAVS) (1644-1710), Danish astronomer, was born at Aarhus in Jutland, 25th September 1644. He studied mathematics at the university of Copenhagen until 1671, when he assisted Picard in determining the geographical position of Tycho Brahe's observatory (Uranienburg on the island of Huen). In 1672 he accompanied Picard to Paris, where he remained nine years, occupied with observations at the new royal observatory and hydraulic works at Versailles and Marly. In 1675 he read a paper before the Academy on the successive propagation of light as revealed by a certain inequality in the motion of the first of Jupiter's satellites (see PARALLAX, vol. xviii. p. 251). In 1681 he returned to Copenhagen, where he spent the remainder of his days as professor of astronomy, but his great ability and practical talents were made use of in several other public employments. He died on 23d September 1710.

Roemer's name is now best known by his discovery of the finite velocity of light. Most of his contemporaries doubted the reality of this discovery, chiefly because the eclipses of the three outer satellites of Jupiter did not show similar irregularities to those exhibited by the first satellite. This is not surprising, as the mutual attraction of the satellites makes their motions far more complicated than astronomers imagined before the development of the theory of gravitation, and it should perhaps be chiefly ascribed to chance that Roemer brought forward his theory, which Bradley's discovery of the aberration of light about fifty years later proved to be a true one. Roemer's ingenuity has, however, appeared very prominently in the important improvements which he carried out in the construction of astronomical instruments. The large "armillary spheres," first constructed by the astronomers of Alexandria and also used by Tycho Brahe, had been superseded by the meridian or mural quadrant for measuring meridian zenith distances, and by the sextant for measuring distances between stars in order to find their difference of right ascension by solving the spherical triangle between the pole and the two stars. Both these instruments were introduced by Tycho Brahe. Roemer, however, saw that Tycho's idea of making the rotating earth itself an astronomical instrument by observing the transits of stars across the meridian could be carried out better by fixing a telescope at right angles to a horizontal axis placed exactly east and west, so that the telescope could only move in the meridian. The first transit instrument was constructed in 1689 and erected in Roemer's house in 1690. In the same year he erected in the university observatory an instrument with altitude and azimuth circles (for observing equal altitudes on both sides of the meridian) and an equatorial instrument. In 1704 he constructed a private observatory at Vridløsemagle, a few miles west of Copenhagen, and mounted a meridian circle (the transit instrument and vertical circle combined) and a transit instrument moving in the prime vertical. Roemer may thus be considered the inventor of nearly all our modern instruments of precision, and it is much to be regretted that his ideas were not adopted by astronomers until about a century later. All the results of his observations were destroyed in a great conflagration in 1728, except three days' work, which has been discussed by Galle (*O. Roemeri triduum observationum astronomicarum a. 1706 institutarum*, Berlin, 1845). His disciple Horrebow has left us a very detailed description of Roemer's instruments and ideas in his *Opera mathematico-physica* (3 vols., Copenhagen, 1740-41). Grant's *History of Physical Astronomy* (London, 1852) gives a very correct account of Roemer and his inventions. About his life see also an article by Philipson in *Nordisk Universitets Tidsskrift*, vol. v., 1860.

¹ For description of this the largest wire suspension bridge in the world, see NEW YORK CITY, vol. xvii. p. 465.

ROERMOND or ROERMONDE (*i.e.*, "Roer-Mouth"), a town of the Netherlands in the province of Limburg (formerly Guelderland), on the right bank of the Maas (Meuse) at the mouth of the Roer, which separates it from the suburb of St Jacob. It is 29½ miles from Maestricht by the railway to Venlo (opened 1865). The old fortifications were dismantled in 1819 and have been partly turned into promenades. At this point the Maas is crossed by a bridge erected in 1866-67, and the Roer by one dating from 1771 and replacing the older structure destroyed in 1764. The finest building in the town is the Romanesque minster church, begun in 1218, and dedicated by Archbishop Engelbert of Cologne. In the middle of the nave is the tomb of Count Gerhard III. of Guelderland and his wife Margaret. The cathedral of St Christopher is also of note; on the top of the tower (246 feet) is a copper statue of the saint and the interior is adorned with paintings by Rubens, Jacob de Wit, &c. The Reformed church was once the chapel of the monastery of the Minorites. The old bishop's palace is now the court-house, and the old Jesuits' monastery with its fine gardens is now occupied as a higher burgher school. Woollen, cotton, silk, and mixed stuffs, paper, flour, and beer are manufactured at Roermond. The population of the town was 5712 in 1840 and 8797 in 1870; and that of the commune has increased from 6005 in 1840 to 10,470 in 1879.

Till the 13th century Roermond was only a village with a hunting lodge known as Pot. The erection of the monastic church in 1218 was followed by the building of town walls in 1231 by Count Otho II. In 1543 Roermond was occupied by the troops of Charles V., and in the course of the Eighty Years' War few places more frequently changed hands. The peace of Münster (1648) left it in the Spanish Netherlands; but between 1702 and 1716 it was held by the forces of the United Provinces.

ROGATION DAYS, the Monday, Tuesday, and Wednesday before Ascension Day. The week in which they occur is sometimes called Rogation Week. See LITANY, vol. xiv. pp. 695-696.

ROGER I., "grand count" of Sicily, the twelfth and youngest son of Tancred de Hauteville in Normandy, was born about 1031. He joined his brother ROBERT GUISCARD (*q.v.*) in Italy in 1058, and after taking part with him in his conquests on the mainland passed over to Sicily in 1061. There such success attended his arms that in 1071 he took the title of count; in 1089 he became "grand count" and in 1098 received from the pope for himself and his successors the title of "legate apostolical" in Sicily. He died in 1101. See SICILY.

ROGER II., count of Sicily, son of the preceding, was born about 1093 and died in 1154. He obtained from the antipope Anacletus II. the title of king of Sicily in 1130, and was crowned in the same year. The title was afterwards confirmed in 1139 by Innocent II. See SICILY.

ROGER OF HOVEDON. See HOVEDON, vol. xii. p. 319.

ROGER OF WENDOVER, who was a monk in the abbey of St Albans, and who died prior of Belvoir in 1237, was long regarded as the sole author of a Latin chronicle entitled *Flores Historiarum*, being a history of the world from the creation down to the year 1235. Recent investigation, however, has disclosed that only the portion from 1189 onwards is from his pen, and that the remainder must be attributed to John de Cella, who was abbot of St Albans from 1195 to 1214. See vol. xv. p. 634.

ROGERS, JOHN (*c.* 1500-1555), editor of the English Bible known as Matthew's. See vol. viii. p. 386.

ROGERS, SAMUEL (1763-1855), the "melodious Rogers" of Byron, the "memory Rogers" of the general reader, has a unique reputation among English men of letters. Not only was he a poet of sufficient mark to be hailed by Byron—with perverse but sincere admiration—as one of the few men of genuine weight in an age of

scribblers, but he was also for fifty years the most celebrated entertainer of celebrities in London. From 1803, when he removed from his chambers in the Temple, till the last year of his long life, his house, 22 St James's Place, was the common meeting-ground of men of distinction in every walk of life. Hence, though his poems are no longer read except by the student, his name is kept alive in the letters and diaries of associates whose works are more permanent than his own,—kept alive, too, not merely as that of a cultured Amphitryon but as that of a conversational wit whose tart sayings are worthy of record.

He was born at Newington Green (London) on 30th July 1763, the son of a wealthy London banker, and related on the mother's side to the celebrated Nonconformist divines Philip and Matthew Henry. Dr Price, the Unitarian, Burke's antagonist, was the family pastor and a frequent visitor at his father's house. The influence of this writer's philosophy can be traced in Rogers's poems. Rogers was educated at the famous Nonconformist academy at Newington Green, where Defoe had been a pupil a hundred years before. Attention to English studies had been a distinct object in this school from its foundation, and Rogers, his youthful ambition awakened, rushed into print as an essayist in the *Gentleman's Magazine* at the age of eighteen. His main desire then was to be a preacher like Dr Price; but he yielded to his father's advice and entered the paternal bank. But he was far from abandoning his love for literature. He read Gray and Goldsmith on his way to the bank, and in 1786 proved his admiration for these exemplars in a volume containing some pretty imitations of Goldsmith and a wildly apostrophic *Ode to Superstition* after the manner of Gray. This volume contains one of the few passages of his that are often quoted—

"There's such a charm in melancholy,
I would not, if I could, be gay."

Following Gray's example, the youthful poet took great pains with his verses, and, after nine years' maturing, published in 1792 a more elaborate and more successful bid for poetic laurels, *The Pleasures of Memory*. This poem may be regarded as the last blaze of the poetic diction of the 18th century before its final extinction. We see here carried to the extremest pitch the theory of elevating and refining familiar themes by abstract treatment and noble imagery. So simple an act as that of trying to remember a half-forgotten fact or fancy is elaborately and beautifully compared to the search of an impatient mother for a child lost in a forest. The common organ-grinder becomes "the blithe son of Savoy," and as such is presented in a most romantic situation as an object for refined sympathy. The good familiar creature memory itself is transfigured into a gracious personification of most benignant and wide-reaching power. In this art of "raising a subject," as the 18th century phrase was, the *Pleasures of Memory* is much more perfect than Campbell's *Pleasures of Hope*, published a few years later in imitation. Byron's criticism is complete,—“there is not a vulgar line in the poem.” This is the acme of positive praise for the fashionable serious poetry of the 18th century: when this can be said of a poet, he has reached the perfection of its ideal of poetic diction. In this poem the characters of the school can be analysed in cold blood, for there is not much excitement in laboured reflexions on the pleasures of memory. Human interest is at a minimum in such frigid exercises; it is almost entirely an affair of diction. The chief feeling excited is astonishment at the pains taken by the poet to provide thick and showy wrappages for such starveling little children of thought.

It was six years before Rogers was ready with another

of his elaborate poems,—*An Epistle to a Friend* (1798). This has at least the advantage of some personal interest. It describes the poet's ideal of a comfortable life, and may be put side by side with Pomfret's *Choice* for literary comparison, and with the poet's own life for fifty years afterwards. Although for conventional poetic reasons Rogers establishes his ideal house in the country instead of in St James's Place, still the principles of living are the same which afterwards regulated his real life and were carried out with easy steady perseverance. "It is the design of this Epistle to illustrate the virtue of True Taste; and to show how little she requires to secure not only the comforts but even the elegancies of life. True Taste is an excellent Economist." Rogers illustrated this maxim in proceeding to surround himself with rare and beautiful works of art and letters, and to make his house the centre for all that was most distinguished and agreeable in London society. Many persons in his time spent ten times as much in the pursuit of a similar object without one-tenth of the success. "I believe," Mrs Norton wrote, "no man ever was so much attended to and thought of who had so slender a fortune and such calm abilities. His God was Harmony; and over his life Harmony presided sitting on a lukewarm cloud." When he moved to St James's Place in 1803 he withdrew from active concern in the bank, contenting himself with a moderate income as a sleeping partner; and so careful a manager was he of this income that he was able not only to entertain and to buy choice things—his collection, which seems to have contained hardly a particle of rubbish, fetching £50,000 when sold after his death—but also to extend generous help to struggling men of letters. It was Rogers who came to Sheridan's relief in his last days when he was deserted by his titled friends; Moore and Campbell received help in need from him, as munificent as it was delicately offered; and he was always ready to befriend much less distinguished merit in distress. It was perhaps characteristic of a man so cautious, equable, and dispassionate that his wit had a depreciating turn and was often exercised with calm insolence at the expense of fussy pretence. But that the man was on the whole of a kindly and lovable nature was shown by an incident late in his life. His popularity was put to the test of misfortune by the robbery of his bank. Most of the money was recovered, but upon the news of the misfortune several men of wealth and title came forward with large offers of assistance.

Although the laureateship was pressed upon Rogers by the prince consort on Wordsworth's death in 1850, he had not been a prolific poet during his long life of cultured leisure and social enjoyment. He continued his practice of writing little and writing slowly. Fourteen years intervened between the *Epistle* and the publication of the *Voyage of Columbus* in 1812. In method this poem was a compromise between the old school of reflective poetry and the new school of narrative. The story of Columbus was the theme, but the story was not told: it was only indicated in a series of reflexions on its most striking moments. The experiment helped forward the literary movement; the new school through Byron took the hint, and *The Giaour*, though interpenetrated with a more vigorous life, was avowedly written on the model of *Columbus*, and dedicated to Rogers. In his next poem *Jacqueline*, which was published in the same volume with Byron's *Lara* in 1814, much to the benefit of the wits of the time, Rogers may be said to have gone over to the new school, adopting their four-accent measure and showing his skill, which was considerable, in pure narrative. His reflective poem on *Human Life*, though published in 1819, can hardly be described as a reversion, for he had been engaged on it off and on for twelve years. It is

much the best of his meditative poems, as elegant and finished in diction as the *Memory*, and much more incisive in thought and touching in sentiment. His last, longest, and most interesting published work was *Italy*, the first instalment of which was published in 1821 and the last in 1834. It is said that, when the publisher complained that the public would not buy *Italy*, Rogers affirmed that he "would make them buy it"; and, calling in the aid of Turner and Stothard, he produced the sumptuous illustrated edition at a cost of £15,000. Apart from these adventitious charms *Italy* has much greater general interest than any other of Rogers's poems, and is likely to be read for long, if only as a traveller's companion. The style is studiously simple; the blank verse has quite an Elizabethan flavour, and abounds in happy lines; the reflexions have a keen point; and the incidental stories are told with admirable brevity and effect. Passages of prose are interspersed, wrought with the same care as the verses, and the notes are models of interesting detail concisely put.

For the last five years of his life Rogers, who had been extremely active till his eighty-eighth year, was confined to his chair in consequence of a fall in the street. He died in London on 18th December 1855, in his ninety-third year. Only very fragmentary records are preserved of the brilliant gatherings at breakfast and dinner in his house. Fragments are to be gleaned in the diaries of Byron, Moore, Sydney Smith, and others. *Recollections* of his table-talk were published in 1856, and a volume of his *Recollections* of celebrities in 1857. A complete *Life* is understood (1885) to be in preparation, with Mr P. W. Clayden as editor. Mr Hayward's essay is the most complete account of Rogers hitherto published. (w. m.)

ROHAN, HENRI DE (1579-1638), a general and writer of eminence and one of the last and best representatives of the independent French noblesse, was born at the château of Bleins in Brittany on 25th August 1579. His father was René II., count of Rohan, and head of a family which had hardly a superior in France for antiquity and distinction, and which was connected with most of the reigning houses of Europe. Rohan was by birth the second son, but his elder brother René dying young he became the heir of the name. He appeared at court and in the army at the age of sixteen, and was a special favourite with Henry IV., after whom, failing the house of Condé, he might be said to be the natural chief of the French Protestants. Having served till the peace of Vervins, he travelled for a considerable time over Europe, including England and Scotland, in the first of which countries he received the not unique honour of being called by Elizabeth her knight, while in the second he was godfather at Charles I.'s christening. On his return to France he was made duke and peer at the age of twenty-four and married Marguerite de Béthune, Sully's daughter, receiving lucrative appointments. After the assassination of Henry IV., which was a great blow to him, Rohan fought with success at the siege of Jülich. But from this time onwards he was for the greater part of many years either in active warfare against the Government of his country, or in active though peaceable opposition to it. For a time, however, he abstained from actual insurrection, and he endeavoured to keep on terms with Marie de' Medici; he even, despite his dislike of De Luynes, the favourite of Louis XIII., reappeared in the army and fought in Lorraine and Piedmont. It was not till the decree for the restitution of church property in the south threw the Bearnese and Gascons into open revolt that Rohan appeared as a rebel. His authority and military skill were very formidable to the royalists, forced them among other checks to raise the siege of Montauban, and brought about the treaty of Montpellier (1623). But Rohan did not escape the re-

sults of the incurable factiousness which showed itself more strongly perhaps among the French Huguenots than among any other of the numerous armed oppositions of the 17th century. He was accused of lukewarmness and treachery, though he did not hesitate to renew the war when the compact of Montpellier was broken. Again a hollow peace was patched up, but it lasted hardly any time, and Rohan undertook a third war, the first the events of which are recounted in his celebrated *Memoirs*. This last war (famous for the siege of La Rochelle, in which, however, Rohan's brother Soubise, not Rohan himself, was principally concerned) was one of considerable danger for Rohan: he was condemned to death, and a great reward was offered for him dead or alive. Nor at the close of the war did he think it best to remain in France, but made his way to Venice. Here he lived quietly for some time and is said to have received from the Porte the offer of the sovereignty of Cyprus. It is more certain that his hosts of Venice wished to make him their general-in-chief, a design not executed owing to the peace of Cherasco (1631). Soon afterwards Rohan was again called to serve his lawful sovereign. Richelieu had had experience, though not friendly experience, of his abilities, and when France began once more to take a vigorous part in the Thirty Years' War Rohan was appointed to the task of occupying the Valtelline, and thus cutting off the communication between Germany and Italy. He was entirely successful and repeatedly beat both the imperialists and the Spaniards. But, despite this service, Rohan was still thought dangerous to the peace of France owing to his influence with the Huguenots, and objection was even made to his residence in Geneva. He therefore joined Bernhard of Saxe-Weimar, and was serving in his army when he met with the wound which caused his death at Rheinfelden on 13th April 1638. His body was buried at Geneva and his arms solemnly bequeathed to and accepted by the Venetian republic. Rohan's wife was a woman of talent and energy, though she did not escape scandal. His younger brother Benjamin, generally known as Soubise, was, like him, a famous Huguenot leader. His daughter and only recognized surviving child, named Marguerite, carried the honours of Rohan into the Chabot family.

What has chiefly preserved Rohan's memory is not his military achievements, though they were remarkable, nor his political position, though it was high, but his admirable *Memoirs*. These cover the civil wars in three books, while a fourth contains the narrative of the Valtelline campaigns; and they rank among the best products of the singular talent for memoir-writing which the French aristocracy of the 16th and 17th centuries possessed. Alike in style, in clearness of matter, and in shrewdness of thought they deserve very high praise. The first three books appeared in 1644, that on the Valtelline War not till 1758. Some suspicions were thrown on the genuineness of this latter, but it would seem groundlessly. Rohan also wrote *Le Parfait Capitaine*, an adaptation of the military precepts and examples of Cæsar to modern warfare; an account of his travels; a political tract, *L'Intérêt des États et des Princes de la Chrétienté*, &c. The *Memoirs*, which alone have continued to be reprinted, may be conveniently found in the collection of Michaud and Poujoulat, vol. xix.

ROHAN, LOUIS RENÉ ÉDOUARD, CARDINAL DE (1734-1803), prince de Rohan-Guéméné, archbishop of Strasbourg, the hero of the scandal of the diamond necklace, and a cadet of the great family of Rohan (which traced its origin to the kings of Brittany, and was granted the precedence and rank of a foreign princely family by Louis XIV.), was born at Paris on 25th September 1734. Members of the Rohan family had filled the office of archbishop of Strasbourg from 1704,—an office which made them princes of the empire and the compeers rather of the German prince-bishops than of the French ecclesiastics. For this high office Louis de Rohan was destined from his birth, and soon after taking orders, in 1760, he was nominated coadjutor to his uncle, Constantine de Rohan-

Rochefort, who then held the archbishopric, and he was also consecrated bishop of Canopus. But he preferred the elegant life and the gaiety of Paris to his clerical duties, and had also an ambition to make a figure in politics. He joined the party opposed to the Austrian alliance, which had been cemented by the marriage of the archduchess Marie Antoinette to the dauphin. This party was headed by the duc d'Aiguillon, who in 1771 sent Prince Louis on a special embassy to Vienna to find out what was being done there with regard to the partition of Poland. Rohan arrived at Vienna in January 1772, and made a great noise with his lavish fêtes. But the empress Maria Theresa was implacably hostile to him; not only did he attempt to thwart her policy, but he spread scandals about her daughter Marie Antoinette, laughed at herself, and shocked her ideas of propriety by his dissipation and luxury. On the death of Louis XV., in 1774, Rohan was recalled from Vienna, and coldly received at Paris; but the influence of his family was too great for him to be neglected, and in 1777 he was made grand almoner, and in 1778 abbot of St Vaast. In 1778 he was made a cardinal on the nomination of Stanislaus Poniatowski, king of Poland, and in the following year succeeded his uncle as archbishop of Strasburg and became abbot of Noirmoutiers and Chaise-Dieu. His various preferments brought him in an income of two and a half millions of livres; yet the cardinal was restless and unhappy until he should be reinstated in favour at court and had appeased the animosity which Marie Antoinette felt against him. Though a man of some ability, he became infatuated with the notorious charlatan Cagliostro in 1780, and lodged him in his palace, and in 1782 he made the acquaintance of Madame de Lamotte-Valois, a descendant of an illegitimate branch of the Valois, but a poor adventuress, and married to an adventurer. These people, having acquired great influence over Rohan, determined to turn his excessive desire to become reconciled to the queen to their own advantage. They persuaded him that Marie Antoinette wished him well, and contrived an interview between him and a girl named Oliva, who greatly resembled the queen, in the gardens of Versailles in August 1784, so skilfully that he believed he had seen the queen herself and that she had given him a rose. The adventuress then persuaded him that the queen would be much gratified by the present of an extremely valuable diamond necklace which she had refused in 1778 and 1781, and on 26th January 1785 the cardinal purchased it for 1,600,000 francs, to be paid in three instalments, and handed it over to a pretended valet of the queen on receipt of a forged letter of thanks signed "Marie Antoinette of France." The comte de Lamotte-Valois at once started for London, and, after breaking up the necklace, began to sell the diamonds separately. The plot soon came to light, and the king sent the cardinal to the Bastille. This arrest of a great nobleman and an archbishop excited the wrath of both the nobility and the bishops, and the large party opposed to the Austrian alliance regarded him as a martyr. In this feeling the old courtiers and the judges of the parlement of Paris participated, for they hated the queen for her abolition of strict etiquette and for her extravagance and frivolity. The people, who had also been taught by pamphleteers to hate her and to regard her as the cause of all their ills, shared the feeling of their superiors in education; and, when the parlement of Paris solemnly absolved the cardinal of all blame on 31st May 1786, his acquittal was received with universal enthusiasm, and regarded as a victory over the court and the queen. Though acquitted by the parlement of Paris, the cardinal was deprived of his office as grand almoner and exiled to his abbey of Chaise-Dieu. He was soon allowed to return

to Strasburg, and his popularity was shown by his election in 1789 to the states-general by the clergy of the bailliages of Haguenau and Weissenburg. He at first declined to sit, but the states-general, when it became the national assembly, insisted on validating his election. But as a prince of the church in January 1791 he refused to take the oath to the constitution, and went to Ettenheim, in the German part of his diocese. In exile his character improved, and he spent what wealth remained to him in providing for the poor clergy of his diocese who had been obliged to leave France; and in 1801 he resigned his nominal rank as archbishop of Strasburg. On 17th February 1803 he died at Ettenheim.

For the affair of the diamond necklace and the life of the cardinal see the *Mémoires* of his secretary, the Abbé Georgel, of the baroness d'Oberkirch, of Beugnot, and of Madame Campan; the *Mémoires inédits du Comte de Lamotte-Valois*, ed. Louis Lacour, 1858, in which Rohan is ably defended and Marie Antoinette stigmatized; *Marie Antoinette et le Procès du Collier*, by Émile Campardon, 1863; and Carlyle's "The Diamond Necklace," in *Fraser's Magazine* (1837), republished in his *Essays*.

ROHILKHAND or ROHILCUND, a division or commissionership in the North-Western Provinces of India, lying between 27° 35' and 30° 1' N. lat. and between 78° 1' and 80° 26' E. long. It comprises the six districts of Bijnaur (Bijnor), Murādābād, Budāun, Bareilī (Bareilly), Shāhjahānpur, and Pilibhit, together containing an area of 10,885 square miles, with a population (1881) of 5,122,557 (males 2,728,761, females 2,393,796). By religion, Hindus numbered 3,921,989, Mohammedans 1,192,263, and Christians 6304. In the same year there were 11,327 towns and villages in the division and 639,604 occupied houses. Of the total area 6446 square miles were returned as cultivated and 2516 as cultivable. In 1883-84 Rohilkhand division had 2592 miles of road and 163 miles of railway; in the same year its gross revenue amounted to £980,682, of which the land-tax contributed £695,181.

ROHTAK, a British district of India, in the Hissar division, under the lieutenant-governorship of the Punjab, lying between 28° 19' and 29° 17' N. lat. and between 76° 17' and 77° 30' E. long. It contains an area of 1811 square miles, and is bounded on the N. by Karnal, on the E. by Delhi, on the S. by Gurgaon, and on the W. by Hissar and the native state of Jhind. Rohtak district is situated in the midst of the level tableland separating the Jumna and the Sutlej valleys; it is one unbroken plain, consisting of a hard clay copiously interspersed with light yellow sand, and covered in its wild state by a jungle of scrubby brushwood. It possesses no grand scenery, but on the whole the features of the district are more diversified than many of the plain districts of the Punjab. The only natural reservoir for its drainage is the Najafgarh Jhil, a marshy lake lying within the boundaries of Delhi. The Sahibi, a small stream from the Ajmere hills, traverses a corner of the district, and the northern portions are watered by the Rohtak and Butana branches of the Western Jumna Canal, but the greater portion of the central plain, comprising about two-thirds of the district area, is entirely dependent upon the uncertain rainfall. The climate, though severe in point of heat, is generally healthy; the average rainfall is about 19½ inches. Rohtak has no railway; it is, however, well provided with roads, which cross it in every direction, and telegraphic communication is now under construction.

In 1881 the population of Rohtak district numbered 553,609 (296,224 males and 257,385 females). By religion Hindus numbered 468,905, or nearly 85 per cent. of the total population, and Mohammedans 79,510. There are only two towns in the district with inhabitants exceeding 10,000, namely, ROHTAK (see below) and Jhajjar with 11,650. Rohtak is a purely agricultural district, but its produce hardly more than suffices for its home consumption. Of the total area of 1811 square miles, 1416 were in 1883-84 returned as cultivated and 269 as cultivable. The chief products

are food grains, pulses, cotton, and sugar-cane. There are no manufactures of more than local importance excepting ornamental turbans at Rohtak and saddlery at Kalanar. Pretty pottery is made at Jhajjar, and cotton cloth for home use is woven in large quantities. The gross revenue of the district in 1883-84 was £78,846, of which £65,440 was derived from the land-tax.

Rohtak was formerly included within the region known as Haryana, which in 1718 was granted by the emperor Farokhsar to his minister Rukhan-ad-Daula, who in his turn made over the greater part of it to a Baluch noble, Faujdar Khan, afterwards created nawab of Farakhnagar. The district, together with the other possessions of Scindia west of the Jumna, passed to the East India Company in 1803. Until 1832 Rohtak was under the administration of a political agent, resident at Delhi, but in that year it was brought under the general regulations and annexed to the North-Western Provinces. The outbreak of the mutiny in 1857 led to the abandonment, for a time, of the district by the British, when the mutineers attacked and plundered the civil station of Rohtak, destroying every record of administration. It was not until after the fall of Delhi that the authority of the British Government was permanently restored. The constitution of the present district was then taken in hand, and Rohtak was transferred to the Punjab Government.

ROHTAK, municipal town and headquarters of the above district, lying in 28° 54' N. lat and 76° 38' E. long., with a population in 1881 of 15,699 (males 8155, females 7544). It is situated 44 miles to the north-west of Delhi on the road to Hissar, and, viewed from the sandhills to the south, forms with its white mosque in the centre and the fort standing out boldly to the east a striking and picturesque object. Rohtak is a town of great antiquity, but beyond the fact that it became the headquarters of a British district in 1824 it is of no considerable importance.

ROJAS-ZORILLA, FRANCISCO DE, Spanish dramatist, a contemporary of Lope de Vega and Calderon, was born about the beginning of the 17th century. Of his personal history hardly anything has been recorded, but we know that he lived at Madrid, and about the year 1641 he seems to have become a knight of Santiago. Of his dramatic compositions some thirty still survive, which can be read in the 54th volume of the *Biblioteca de Autores Españoles* (1861); the best by general consent is held to be that entitled *Del Rey abajo Ninguno*, otherwise known by the name of its hero as *Garcia de Castañar*. Of the others, apart from their intrinsic merit, a double literary interest attaches to the *No hay Padre siendo Rey*, which was borrowed by Rotrou for his *Venceslas*, to the *Donde hay Agravios no hay Zelos* and the *Amo criado*, which were imitated by Scarron in his *Jodelet Souffleté* and *Maître Valet*, and to the *Entre Bobos anda el Juego*, to which Thomas Corneille has acknowledged his obligations for his *Bertrand de Cigarral*. The *Garcia de Castañar*, *Donde hay Agravios*, and *Entre Bobos anda el Juego* are given by Ochoa in his *Tesoro del Teatro Español*.

ROKITANSKY, CARL VON ROKITANSKY, FREIHERR VON (1804-1878), the founder of the Vienna school of pathological anatomy, was born in 1804 at Königgrätz in Bohemia. He got his schooling in his native town as well as at the gymnasium of Leitmeritz, after which he became a student of medicine at Prague. He finished his medical studies at Vienna, graduating there in 1828. Soon after he became assistant to Wagner, the professor of pathological anatomy, and succeeded him in 1834 as prosector, being at the same time made extraordinary professor. It was not until ten years later (1844) that he reached the rank of full professor. To his duties as a teacher he added in 1847 the onerous office of medico-legal anatomist to the city, and in 1863 an influential office in the ministry of education and public worship, wherein he had to advise on all routine matters of medical teaching, including patronage. A seat in the upper house of the reichsrath rewarded his public labours in 1867, and on his retirement from all his offices in 1874 he was made a commander of the Order of Leopold. He joined the Imperial Academy of

Sciences as a member in 1848, and became its president in 1869. He was president also of the medical society of the Austrian capital and an honorary member of many foreign societies. On his retirement at the age of seventy his colleagues celebrated the occasion by a function in the aula of the university, where his bust was unveiled. In his leave-taking speech he said that work had always been a pleasure to him and pleasures mostly a toil. His death in 1878 elicited many genuine expressions of affection and of esteem for his upright character. Two of his sons became professors at Vienna, one of astronomy and another of medicine, while a third gained distinction on the lyric stage.

With Rokitansky's name is associated the second great period of the medical school of Vienna, its first success having been identified with the liberal patronage of it by Maria Theresa and with the fame of Van Swieten, whom the empress had attracted thither from Leyden. The basis of its second reputation was morbid anatomy, together with the precision of clinical diagnosis dependent thereon, and associated with the labours of Rokitansky's lifelong friend Skoda. The anatomical vogue had begun under Wagner while Rokitansky was still a student; but it reached its highest point while the latter was assistant in the dead-house and afterwards prosector and professor. The enthusiasm for the post-mortem study of disease brought one very serious consequence at the outset, in the enormous increase of the death-rate from puerperal fever in the lying-in wards of the general hospital. A comparison between the slight mortality in the wards that were afterwards reserved for the training of midwives and the excessive mortality in those set apart for the training of students proved that the cause was the conveyance of cadaveric poison from the dead-house by the hands of the latter. The precautions introduced after 1847 succeeded in removing that grave reproach from the study of morbid anatomy. Another and more lasting consequence of the assiduous pursuit of post-mortem study, counterbalancing somewhat the advantage of a more precise and localized diagnosis, was the loss of faith in the power of drugs to remedy the textural changes—the so-called "nihilism" of the Vienna school. The immediate outcome of Rokitansky's close application to the work of the dead-house was his *Handbuch der pathologischen Anatomie* (1842-46), in 3 vols., of which the first was published last. The value of the work lies in the second and third volumes, containing succinct descriptions of the visible changes and abnormalities in the several organs and parts of the body. Whenever Rokitansky touched the vital problems of general pathology, as he did in the postponed first volume, he revealed a metaphysical bent, which was strong in him behind all his undoubted powers of outward observation and accurate description. Being a few years too soon to profit by the microscopic movement which led to the cellular pathology, he endeavoured to reconcile the old humoral doctrine with his anatomical observations, and to read a new meaning into the doctrine of the various dyscrasias. The third and last edition of his *Handbuch* was published from 1855 to 1861. In 1862 he entered into possession of a new pathological institute, in which he found means, for the first time, to display his extensive collection of specimens in a museum. Although he had no direct share in the newer developments of pathology, he was far from indifferent or reactionary towards them; indeed the laboratories and chairs for microscopic and experimental pathology and for pathological chemistry were warmly encouraged and aided by him.

Next to his *Handbuch*, of which the Syd. Soc. published an English translation in 4 vols., 1849-52, his most important writings were four memoirs in the *Denkschriften* of the Vienna Academy of Sciences (on the Anatomy of Goitre, Cysts, Diseases of Arteries, and Defects in the Septa of the Heart), the last as late as 1875. Other papers of less importance brought up the total of his writings to thirty-eight, including three addresses of a philosophical turn, on "Freedom of Inquiry" (1862), "The Independent Value of Knowledge" (1867), and "The Solidarity of Animal Life" (1869).

ROLAND. JEAN MARIE ROLAND DE LA PLATRIERE (1734-1793), who, along with his wife, MANON JEANNE PHILIPON (1754-1793), played a prominent part in the history of the French Revolution, in connexion chiefly with the policy and fortunes of the Girondists, was born near Villefranche in 1734. He received a good education, and early formed the studious habits which remained with him through life. Proposing to seek his fortune abroad, he went on foot to Nantes, but was there prostrated by an illness so severe that all thoughts of emigration were perforce abandoned. For some years he was employed as a clerk; thereafter he joined a relative who was inspector of manufactures at Amiens, and he himself speedily rose to the position of inspector. To these two

employments may be ascribed those qualities of assiduity and accuracy, and that familiarity with the commerce of the country, which distinguished his public career. In 1781 he married Manon Jeanne Philpon, who was his junior by twenty years. She was the daughter of Gratien Philpon, a Paris engraver, who was ambitious, speculative, and nearly always poor. From her early years she showed great aptitude for study, an ardent and enthusiastic spirit, and unquestionable talent. She was to a considerable extent self-taught; and her love of reading made her acquainted first with Plutarch—a passion for which author she continued to cherish throughout her life—thereafter with Bossuet, Massillon, and authors of a like stamp, and finally with Montesquieu, Voltaire, and Rousseau. These studies marked stages of her development; and as her mind matured she abandoned the idea of a convent which for a year or two she had entertained, and added to the enthusiasm for a republic which she had imbibed from her earlier studies not a little of the cynicism and the daring which the later authors inspired. She almost equalled her husband in knowledge and infinitely excelled him in talent and in tact. Through and with him she exercised a singularly powerful influence over the destinies of France from the outbreak of the Revolution till her death.

For four years after their marriage Roland lived at Amiens, he being still an inspector of manufactures; but his knowledge of commercial affairs enabled him to contribute articles to the *Encyclopédie Nouvelle*, in which, as in all his literary work, he was assisted by his wife. On their removal to Lyons the influence of both became wider and more powerful. Their fervent political aspirations could not be concealed, and from the beginning of the Revolution they threw in their lot with the party of advance. The *Courrier de Lyon* contained articles the success of which reached even to the capital and attracted the attention of the Parisian press. They were from the pen of Madame Roland and were signed by her husband. A correspondence sprang up with Brissot and other friends of the Revolution at headquarters. In Lyons their views were publicly known; Roland was elected a member of the municipality, and when the depression of trade in the south demanded representation in Paris he was deputed by the council of Lyons to defend the interests of the city before the constituent assembly. Accompanied by his wife, he appeared in the capital in February 1791.

They had made many and influential friends in advance, and Madame Roland's salon soon became the rendezvous of Brissot, Pétion, Robespierre, and other leaders of the popular movement. In person Madame Roland was attractive though not beautiful; her ideas were clear and far-reaching, her manner calm, and her power of observation extremely acute. It was almost inevitable that she should find herself in the centre of political aspirations and presiding over a company of the most talented men of progress. Her resolve was fixed, and gradually she impressed it upon all: the France of 1791 was a France of transition; a republic alone was its destiny, was the ideal of philosophy, the expression of liberty, the goal of history. This was the constant aim of her influence and her speech; it was accompanied with a petty animosity, almost hatred, towards the king and queen; but it found a ready echo in the minds of those leaders who willingly admired her calm and learned reasoning. The royal flight in June and the ignominious return lent impetus to these ideas; a journal entitled *The Republican* appeared in Paris, but at its second number was suppressed. In its organization Madame Roland had a hand.

In September 1791, Roland's mission being executed, they returned to Lyons. Meanwhile the inspectorships

of manufactures had been abolished; he was thus free; and they could no longer remain absent from the centre of affairs. In December they again reached Paris. Roland became a member of the Jacobin Club. The rupture had not yet been made evident between the Girondist party and that section still more extreme, that of the Mountain. For a time the whole left united in forcing the resignation of the ministers. When the crisis came the Girondists were ready, and in March 1792 Roland found himself appointed minister of the interior. As a minister of the crown Roland exhibited a remarkable combination of political prejudice with administrative ability. While his wife's influence could not increase the latter it was successfully exerted to foment and embitter the former. He was *ex officio* excluded from the legislative assembly, and his declarations of policy were thus in writing,—that is, in the form in which she could most readily exert her power. A great occasion was invented. The decrees against the emigrants and the non-juring clergy still remained under the veto of the king. A letter was penned by Madame Roland and addressed by her husband to Louis. It remained unanswered. Thereupon, in full council and in the king's presence, Roland read his letter aloud. It contained many and terrible truths as to the royal refusal to sanction the decrees and as to the king's position in the state; but it was inconsistent with a minister's position, disrespectful if not insolent in tone, disloyal in spirit, and grossly disfigured by repeated threats of violence on the part of the people. It was meant, and it was used, simply as a lecture to the king's face and as an accusation behind his back. Roland's dismissal followed. Then he completed the plan: he read the letter to the assembly; it was ordered to be printed, became the manifesto of disaffection, and was circulated everywhere. In the demand for the reinstatement of the dismissed ministers were found the means of humiliation, and the prelude to the dethronement, of the king.

After the abolition of royalty on the 10th of August, Roland was recalled to power, one of his colleagues being Danton. To his dismay he found that the passions which he had lent his aid in evoking he was powerless to allay, and that the party of the Mountain was, on the contrary, utilizing these passions for purposes of incredible excess. From this moment, though too late, the conduct of Roland, his wife, and the whole Gironde became heroic. They fearlessly denounced the massacres of September, Roland writing boldly to the assembly on the subject. Both husband and wife became the butt of calumny and the object of increasing dislike on the part of the ultra-revolutionists,—Robespierre shunning them, Danton denouncing them, and Marat in his journal heaping upon them the foulest falsehoods. Still the Girondists, from Vergniaud downwards, banded themselves bravely on their side; but on 22d January 1793 Roland sent in his resignation. It was the day after the execution of the king.

Still they remained in Paris, unflinchingly, but with ever less and less success, attempting to regulate and elevate the Revolution. Calumny continued. Once Madame Roland appeared personally in the assembly to repel the falsehoods of an accuser, and her ease and dignity evoked enthusiasm and compelled acquittal. But violence succeeded violence, and early on the morning of the 1st of June she was arrested and thrown into the prison of the Abbaye. Roland himself escaped secretly to shelter in Rouen. Released for an hour from the Abbaye, she was again arrested and thrown among the horrors of Sainte Pélagie. Finally she was transferred to the Conciergerie. In prison she won the affections of the guards, and was allowed the privilege of writing materials and the occasional visits of devoted friends. She there wrote her

Appeal to an Impartial Posterity, those memoirs which display a strange alternation between self-laudation and patriotism, between the trivial and the sublime. On 8th November 1793 she was conveyed to the guillotine. Before yielding her head to the block, she bowed before the clay statue of Liberty erected in the Place de la Revolution, uttering her famous apostrophe—"O Liberty! what crimes are committed in thy name!" One week later Roland, having heard of his wife's death, wandered some miles from his refuge in Rouen; maddened by despair and grief, he wrote a few words expressive of his horror at those massacres which could only be inspired by the enemies of France, protesting that "from the moment when I learned that they had murdered my wife I would no longer remain in a world stained with enemies." He affixed the paper to his breast, and unsheathing a sword-stick fell upon the weapon, which pierced his heart, on 15th November 1793. (T. S.)

ROLAND, LEGEND OF. The main incident of this legend is founded upon an undoubted historical event,—the Spanish expedition of Charlemagne (778). The Frankish king, having crossed the Pyrenees and captured Pamplona, was beaten back from the walls of Saragossa.¹ On his return the "Gascons" (Basques) surprised his rear-guard, and, according to the testimony of Eginhard, cut it off to a man (*Vit. Car.*, c. i.),—"In which battle were slain Eggihard, provost of the royal table . . . and Hruodlandus, prefect of the Britannic march." This account is supported by other evidence more or less contemporary, as, for example, the *Vita Hludowici*.² From this work we gather that at the time of its composition (c. 840) the Roncesvalles disaster was already the subject of popular tradition; for its author, speaking of the Frankish chiefs slain in this battle, says, "quorum, quia vulgata sunt, nomina dicere supersedi." Yet in its earliest extant form the legend has already worked in the names and traditions of a later age, e.g., the traitor Ganelon, who probably, as Leibnitz has suggested, represents Wenelon, archbishop of Sens, accused of treason towards Charles the Bald in 859.³ It is interesting to note that during the last few years Dümmler (*Romania*, ii. 146-148) has discovered what appears to be the epitaph of the above-mentioned Eggihard. This, as G. Paris remarks, renders it highly probable that the similar elegiac verses quoted in the *Pseudo-Turpin* (cc. 24, 25), which make Roland thirty-eight years old at the time of his death, are also genuine survivals from the Carolingian era. According to Dümmler's discovery, the battle of Roncesvalles was fought on 15th August.

Earliest Extant Forms.—The legend of Roland makes its first appearance in (a) the so-called *History of Archbishop Turpin* and (b) the *Chanson de Roland*. The former, according to Paris, may be divided into two parts; of these the first (cc. 1-5), written about 1050, deals with Charlemagne's conquest of Spain, but contains no allusion to Roland. The latter section, written by a monk of Vienne between 1109 and 1119, gives the main outlines of the familiar legend: Marsilius and Baligant appear (c. 21); Roland fights with the giant Ferracute, Ariosto's Ferrau (*Orl. Fur.*, c. 1); then follow the narrative of Ganelon's treachery (c. 21) and punishment (c. 26), the episode of Roland's horn, Roland's address to his sword (c. 22), his last prayer, his death (c. 23), and Charles's vengeance on the Saracens (c. 26).⁴ The *Chanson de Roland*, in its extant version probably composed in England between 1066 and 1095, looks like the expansion of an earlier poem written towards the beginning of the same century.

It gives the legend in much the same form as the *Pseudo-Turpin*, but with far more detail and poetic fire. There are, however, a few striking differences between the two accounts. Such deal with the causes and method of Ganelon's treachery, the personality of Baldwin, and the fate of Archbishop Turpin. Above all, the Latin prose-writer has no second hero in Oliver and knows nothing of Roland's love for Aude.

Additions to the Early Legend.—The name of Roland was soon transplanted from its native soil in the *gestes* of Roncesvalles into almost the whole cycle of later Charlemagne romance; and by weaving these notices of him together we may construct the legendary story of his life. Thus the *Enfances Roland* (c. 1200) tells of his parents' disgrace and his infant valour; in the *Chanson d'Aspremont* (late 12th century) we read how he became possessed of his famous sword Durendal; *Girars de Viane* (c. 1200) recounts his great fight with Oliver and his love for that hero's sister Aude. Roland plays scarce less prominent a part in *Renard de Montauban* (13th century) and figures in *Fierabras* (12th century), *Otinel* (c. 1250), and the *Voyage à Jerusalem* (c. 1130). Nicholas of Padua's *Entrée en Espagne* (c. 1320) makes Roland quarrel with Charles and fly to Persia, whence he only returns to aid in the siege of Pamplona and to perish at Roncesvalles.

Diffusion of the Roland Legend in Literature.—The immense popularity of the *Chanson de Roland* and the *Pseudo-Turpin* may be measured by the influence they have exercised on the literature of nearly every country of western Europe. To the original *Chanson de Roland* a poet of perhaps the reign of Philip Augustus added a new ending of some 2000 lines. From this full version are descended the *Remaniements* or *Roncevaux*, of which so many French MSS. remain. During the 12th century a Swabian priest, Conrad, translated the *Chanson* into rhymed German verse. This *Rolandlied* forms the basis of the Stricker's *Karl* (c. 1230), in its turn the foundation for the Roncesvalles section of the so-called *Karl Meinet* (early 14th century). In England Taillefer's singing of a "cantilena Rollandi" prefaced the first Norman charge at Hastings;⁵ but, curiously enough, the English *Roland* of the 14th century in some places seems to look back for its original to the *Pseudo-Turpin* rather than to the *Chanson de Roland*, which received its final shape in England.⁶ It was probably from that country that the Roland legend passed to Scandinavia and Iceland. There the battle of Roncesvalles forms the eighth section of the great *Karlamagnus Saga* (13th century), which is of critical importance, as it preserves some details not to be found in the *Chanson de Roland* as we now have it. Translated into Danish, this work took the form of the *Kejser Karl Magnus* (15th century), to this day a popular book in Denmark. The legend penetrated eastward into Hungary and Bohemia; while in the west Roland appears in the Welsh *Mabinogion* and the tales of Ireland. M. Bormans has published Flemish fragments of the Roncesvalles story; and these, which belong to the 13th and the 14th century, are based on the *Chanson*. In the 16th century the same legend circulated throughout the Low Countries in one of the most popular books of the day. In the 18th century the Spanish "fabulæ histronum," of which Roderic of Toledo speaks (d. 1247), and which may, on one hypothesis, have been the sources whence the *Pseudo-Turpin* drew his materials, gave way to a new and more patriotic legend, in which Bernard del Carpio takes the leading place; but three centuries later (1528) Nicolas di Piamonte revived the purer Frankish tradition in the still popular *Karlo Magno*.

It is, however, on the literature of Italy that the Roland legend has exercised its widest influence. Here the songs, chanted by the early French jongleurs, towards the end of the 12th century made place for the Italianized *Remaniements*, till the epoch of Nicholas of Padua (c. 1320), whose gigantic *Entrée en Espagne* (with its supplement the *Prise de Pampelune*), though but a mosaic of earlier materials, formed the groundwork of the Tuscan poem, the *Spagna* (1350-1380), on which the *Rotta di Roncisvalle* in its turn is founded. Somewhat later than the verse *Spagna* came the *Spagna* in prose; and the extraordinary popularity of the legend in its new guise made the names of Charlemagne's paladins familiar down to the age of the Renaissance. We have now reached the era of the great Italian poets Pulci (*Morgante Maggiore*, 1481), Boiardo (*Orlando Innamorato*, 1486), Ariosto (*Orlando Furioso*, 1516), and Berni (1541), whose poems, however, with the exception of Pulci's, are indebted to those of their predecessors for little more than the names of their chief characters and their general plan.

Roland in Mediæval Art.—The earliest remaining statue of

⁵ Will. of Malmes., *Gest. Reg. Angl.*, iii. 242; Wace, ed. Andresen, ii. ll. 8035-40.

⁶ Still more applicable is this remark to *Roland and Vernagou* (c. 1330), and the death of Roland in Caxton's *Charles the Grete*. All three works have been edited for the Early English Text Society by Mr Hertridge.

¹ *Annales Eginhardi*, 778, with which comp. Dozy, *Hist. des Mus.* d'Espagne, i. 376-380.

³ *Ann. Imperii*, ed. Pertz, i. 77.

⁴ *Turp. Hist.*, ed. Castets, 1880.

Roland seems to be the 12th-century statue in the church of San Zeno at Verona.¹ The whole history of Roncesvalles is blazoned in the 13th-century window in Chartres cathedral.² A similar window existed formerly in the abbey church of St Denis. M. Vétault (*Hist. de Ch.*, p. 496) has also figured a Carolingian coin which bears the names of both Roland and Charles. The so-called Roland statues of Germany are most probably symbolical of the judicial and other rights once possessed by the people of those towns where they are to be found. In some cases at least the name seems to have been transferred to what were originally meant to be representations of the first Othos (10th century). The earliest known allusion to a "statua Rolandi" under this name occurs in a privilege granted by Henry V. to the town of Bremen (1111). The word "Rolandssäule" is perhaps a piece of folk-etymology for an earlier "Rothlandssäule" or red-land-pillar, i.e., the before-mentioned figure or pillar, which signified that the state in which it stood had the power of life and death,—in other words, was a Blutgerichtstätte. Grimm suspects a connexion between the Roland statues and those old Teutonic pillars of which the Irminsul destroyed by Charlemagne is the best-known example.³ These Roland statues are sometimes in the open air, as at Bremen and Magdeburg; or against the town-house, as at Halberstadt; or in the church, as formerly at Göttingen. Sometimes they ride on horseback, as at Haldensleben near Magdeburg; but more generally they are to be found standing upright. They always bear a sword in their right hand and very frequently a shield in their left. They are usually armoured, as at Magdeburg, but are occasionally dressed in more peaceful robes, as at Halle (on the Saale), or both cloaked and armoured, as at Wedel in Holstein and at Bremen. Sometimes they are crowned, as at Wedel and Nordhausen. The heads of the statues differ extremely,—being long-bearded at Erfurt, short-bearded at Wödel, and absolutely smooth-faced at Bremen. At Brandenburg the Roland was ornamented with silver and perhaps with gold. The statues are often of colossal height, that of Belgern (Merseburg) being over 9 ells high, exclusive of its pedestal. Perhaps the most famous Roland pillar still remaining is that of Bremen.

For further information on this subject see Leibnitz, *Annales Imperii*, i. 478, &c.; the treatises of Gryphander (ed. 1666) Eggelingius (1700), B. Carpov (1742), J. H. Hartmann (1785), and Nicholas Meyer, *De Wicbildis* (1739); and Zoepf's exhaustive account in vol. iii. of his *Alterthümer des deutschen Reichs*. For the Roland legend generally consult Léon Gautier's *Épopées Françaises*, iii., and *Chanson de Roland*, edd. 1870 and 1881. Besides these, see the various romances of the Charlemagne cycle edited for the series of Anciens Poètes de France, the various volumes of *Romania*, and the late editions of the several poems alluded to in the foregoing article. For the relationship of the Roland legend to the Italian poets see the works of P. Rajna. (T. A. A.)

ROLLER, a very beautiful bird so called from its way of occasionally rolling or turning over in its flight,⁴ somewhat after the fashion of a Tumbler-Pigeon. It is the *Coracias garrulus* of ornithology, and is widely though not very numerously spread over Europe and Western Asia in summer, breeding so far to the northward as the middle of Sweden, but retiring to winter in Africa. It occurs almost every year in some part or other of the British Islands, from Cornwall to the Shetlands, while it has visited Ireland several times, and is even recorded from St. Kilda. But it is only as a wanderer that it comes hither, since there is no evidence of its having ever attempted to breed in Great Britain; and indeed its conspicuous appearance—for it is nearly as big as a Daw and very brightly coloured—would forbid its being ever allowed to escape the gun of the always ready murderers of stray birds. Except the back, scapulars, and tertials, which are bright reddish-brown, the plumage of both sexes is almost entirely blue—of various shades, from pale turquoise to dark ultramarine—tinted in parts with green. The bird seems to be purely insectivorous. The genus *Coracias*, for a long while placed by systematists among the Crows, has really no affinity whatever to them, and is now properly considered to belong to the heterogeneous group of Birds in this work called *Picariæ* (ORNITHOLOGY, vol. xviii. p. 41), in which

¹ Figured in Gautier's *Chanson*, ed. 1881, p. 38.

² Figured in Vétault's *Hist. de Charlemagne*, pp. 74, 545.

³ Poeta Saxo, ap. Jaffé, 64-68; see Grimm's *Teut. Myth.* (Stallybrass), i. 119.

⁴ Gesner in 1555 said that the bird was thus called, and for this reason, near Strasburg, but the name seems not to be generally used in Germany, where the bird is commonly called *Rake*, apparently from its harsh note. The French have kept the name *Rollier*. It is a curious fact that the Roller, notwithstanding its occurrence in the Levant, cannot be identified with any species mentioned by Aristotle.

it forms the type of the Family *Coraciidæ*; and its alliance to the Bee-eaters, *Meropidæ*, and KING-FISHERS (vol. xiv. p. 81), *Alcedinidæ*, is very evident. Some eight other species of the genus have been recognized, one of which, *C. leucocephalus* or *C. abyssinus*, is said to have occurred in Scotland. India has two species, *C. indicus* and *C. affinis*, of which thousands upon thousands are annually destroyed to supply the demand for gaudy feathers to bedizen ladies' dresses. One species, *C. temmincki*, seems to be peculiar to Celebes and the neighbouring islands, but otherwise the rest are natives of the Ethiopian or Indian Regions. Allied to *Coracias* is the genus *Eurystomus* with some half dozen species, of similar distribution, but one of them, *E. pacificus*, has a wider range, for it inhabits Australia and reaches Tasmania. Madagascar has four or five very remarkable forms which have often been considered to belong to the Family *Coraciidæ*; and, according to Professor A. Milne-Edwards, no doubt should exist on that point. Yet if any may be entertained it is in regard to one of them, *Leptosomus discolor*, which on account of its zygodactylous feet some authorities place among the *Cuculidæ*, while others have considered it the type of a distinct Family *Leptosomatidæ*. The genera *Brachypteracias* and *Atelornis* present fewer structural differences from the Rollers, and perhaps may be rightly placed with them; but the species of the latter have long tarsi, and are believed to be of terrestrial habit, which Rollers generally certainly are not. These very curious and in some respects very interesting forms, which are peculiar to Madagascar, are admirably described and illustrated by a series of twenty plates in the great work of MM. Grandidier and A. Milne-Edwards on that island (*Oiseaux*, pp. 223-250), while the whole Family *Coraciidæ* is the subject of a monograph by Mr Dresser, as a companion volume to his monograph on the *Meropidæ*. (A. N.)

ROLLER MILL. See FLOUR, vol. ix. pp. 345, 346.

ROLLIN, CHARLES (1661-1741), was born at Paris on 30th January 1661. He was the son of a tradesman, but distinguished himself at school, and at the age of twenty-two was made a master in the Collège du Plessis. He was successively promoted to various other posts of the same kind. In 1694 he was rector of the university of Paris. He held that post for two years instead of one, and was then appointed principal of the Collège de Beauvais. He was of Jansenist principles, and in the later years of his life was for this cause deprived of his appointments and disqualified for the rectorship, to which in 1719 he had been re-elected. It is said that the same reason prevented his election to the French Academy, though he was a member of the Academy of Inscriptions. He was concerned in the affair of the deacon Paris, and shortly before his death (14th December 1741) protested publicly against the acceptance of the bull *Unigenitus*.

Rollin's literary work dates chiefly from the later years of his life, when he had been forbidden to teach. His once famous *Ancient History* (Paris, 1730-38) and the less generally read *Roman History* which followed it were avowed compilations, and compilations which were not only far from critical but even somewhat inaccurate. But they have had the merit not merely of instructing but of interesting generation after generation almost to the present day. A more original and really important work, though less generally known out of France, was his *Traité des Études* (Paris, 1726-31). It contains a summary of what was even then a reformed and innovating system of education, including a more frequent and extensive use of the vulgar tongue and discarding the mediæval traditions that had lingered in France. It had very considerable influence. Rollin's style is good and his personal character was irreproachable.

ROLLING MILL. See IRON, vol. xiii. p. 328 sq.

ROLLO, ROLF, or ROU, Scandinavian rover, born c. 860, died 932. He made himself independent of Harold of Norway, visited Scotland, England, and Flanders in pirating expeditions, and about 912 established himself

on the Seine and laid the foundation of the duchy of NORMANDY (see vol. xvii. p. 539).

ROLLOCK, ROBERT (1555-1599), the first principal of the university of Edinburgh, was the son of David Rollock of Powis near Stirling, and was born in 1555. He received his early education at the school of Stirling from Thomas Buchanan, a nephew of George Buchanan, and after graduating at St Andrews became regent of philosophy there in 1580. In 1583 he was appointed by the Edinburgh town council sole "regent" of the "town's college" ("Academia Jacobi Sexti"), and three years later he received from the same source the title of "principal or first master," and also, with consent of the presbytery, professor of theology. From 1587 he also preached regularly to large audiences every Sunday morning at 7 A.M., and ultimately, yielding to urgent entreaties, he accepted "the full burden of one of the eight ministers of the city." He took a prominent part in the somewhat troubled church politics of the day, and distinguished himself among his compeers by gentleness and tact, as well as ability. In 1593 he was appointed, along with some others, by parliament to confer with the popish lords, and in 1597 it was through his mediation with the king that the ministers of Edinburgh, banished in consequence of a "tumult" in December 1596, were permitted to return. For his eminent services he was chosen moderator of the General Assembly held at Dundee in May 1597. His death took place at Edinburgh on 8th February 1599.

Rollock published in Latin a commentary *On the Epistle to the Ephesians* (1590), a similar work *On Daniel* (1591), a *Logical Analysis of the Epistle to the Romans* (1594), *Questions and Answers on the Covenant of God* (1596), a treatise *On Effectual Calling* (1597), and commentaries on *Thessalonians* (1598), fifteen selected Psalms (1599), and the *Gospel of St John* (1599). Soon after his death eleven *Sermons* were published from notes taken by his students, and his *Select Works* by the Wodrow Society in 1849.

ROLLS, MASTER OF THE, is the third member of the Supreme Court of Judicature in England, the lord chancellor, president of the Chancery Division, being the first and the lord chief justice, president of the Queen's Bench Division, being the second. At first he was the principal clerk of the Chancery and as such had charge of the records of the court, especially of the register of original writs and of all patents and grants under the great seal. Until the end of the 15th century he was called either the clerk or the keeper of the rolls, and he is still formally designated as the master or keeper of the rolls. The earliest mention of him as master of the rolls is in 11 Hen. VII. c. 18; and in 11 Hen. VII. c. 24 he is again described as clerk of the rolls, showing that his official designation still remained unsettled. About the same period, however, the chief clerks of the Chancery came to be called masters in Chancery and the clerk, master, or keeper of the rolls was always the first among them whichever name they bore. In course of time, from causes which are not very easy to trace, his original functions as keeper of the records passed away from him and he gradually assumed a jurisdiction in the Court of Chancery second only to that of the lord chancellor himself. In the beginning he only heard causes in conjunction with the other masters in Chancery and his decrees were invalid until they had been approved and signed by the lord chancellor. But later on he heard causes without assistance and his decrees held good until they were reversed on petition either to the lord chancellor or afterwards to the lords justices of appeal (15 and 16 Vict. c. 83). Before any judge with the formal title of vice-chancellor was appointed the master of the rolls was often spoken of as vice-chancellor. By 1 and 2 Vict. c. 94 the custody of the records was restored to him, and he is chairman of the State Papers and Historical Manuscripts Commissions. Under 38 and 39

Vict. c. 77 and 39 and 40 Vict. c. 59 he now always sits with the lords justices in the Court of Appeal, whose decisions can be questioned only in the House of Lords. The master of the rolls was formerly eligible to a seat in the House of Commons,—a privilege enjoyed by no other member of the judicial bench; but he was deprived of it by the Supreme Court of Judicature Act of 1873 (36 and 37 Vict. c. 66), which provides that all judges of the High Court of Justice and the Court of Appeal shall be incapable of being elected to or sitting in the House of Commons. The master of the rolls is always sworn of the privy council.

ROMAN CATHOLIC CHURCH, the name generally given to that very numerous body of Christians who acknowledge the pope, or bishop of Rome, as head of their church. This name also signifies that the Roman Catholic Church is "Roman in its centre and catholic in its circumference." The number of Catholics throughout the world is variously estimated, some statisticians placing it as low as 152,000,000, others at 213,518,000, and others at 218,000,000. The author of the *Katholischer Missions-Atlas* (Rev. O. Werner, S.J.), largely furnished with Propaganda returns, distributes them as follows:—in Europe, 150,684,050; in Asia, 8,311,800; in Africa, 2,656,205; in both Americas, 51,422,566; in Australia and adjacent islands, 443,442; total, 213,518,063. But he considers that this calculation gives less than the whole number of Catholics throughout the world, and adds nearly a million more, making the total 214,370,000. Dr Hugo Franz Brachelli, superior of the Austrian Statistical Department, in *Die Staaten Europa's* for 1884, gives the number of Catholics in Europe as 155,900,000, distributed mainly as follows:—

Austria-Hungary.....	20,229,825
Prussia and German States	16,229,493
Great Britain and Ireland	6,000,000
France	35,387,703
Italy	26,658,679
Russia	8,500,000
Scandinavia: Sweden (1870), Norway (1875), Denmark (1880)	4,075
Netherlands.....	1,439,137
Luxemburg	207,782
Belgium (pop. 5,519,844)	5,501,844
Liechtenstein, Monaco, &c., almost entirely.	
Spain and Portugal (pop. 21,164,380)	21,148,880
Greece and Montenegro, over.....	124,000
Turkey	218,254
Bosnia and Herzegovina.....	209,391

The supreme pontiff, who traces his succession from St Peter (see POPedom), is regarded by Catholics as "vicar of Christ, head of the bishops, and supreme governor of the whole Catholic Church, of whom the whole world is the territory or diocese." He is also patriarch of the West, bishop of Rome and its district, and temporal prince over the states of the church known as the Pontifical States—though the exercise of the last prerogative has been in abeyance since the events of 1859 and 1870. The pope has a primacy or supremacy, not only of honour but of power, authority, and immediate jurisdiction, over the universal church. When he is canonically elected, and has given his consent to the election, he possesses, without any other confirmation, authority over the whole church, even though at his election he may not have been either bishop, priest, deacon, or subdeacon, but a simple layman. In the early ages of the church subdeacons were occasionally elected, deacons more frequently, and bishops rarely. In the 11th century Gregory VII., previously known as the deacon Hildebrand, was ordained priest after his election and consecrated bishop later. The first pope invested with the episcopal dignity prior to his election to the pontificate was Formosus, bishop of Porto, elected

891. From the end of the 13th century it was the ordinary custom to choose the pope from the bishops; and from 1592 to 1775 only three were elected who had not been bishops previously. Clement XIV., Pius V., and Gregory XVI. were simple priests when elected to the papacy. The cardinals, to whom the election of the pontiff is reserved, generally select one of their own body for this important position. The privilege of consecrating the pope is reserved to the cardinal bishop of Ostia. From the moment of election the pope may perform all acts appertaining to his jurisdiction, such as granting indulgences, issuing censures, giving dispensations, canonizing saints, instituting bishops, creating cardinals, and suchlike. The powers inherent in the priesthood and episcopate, such as the remission of sins, the administration of the sacraments of confirmation, holy orders, &c., he cannot exercise unless he be ordained and consecrated. Hence the office of sovereign pontiff is a dignity not of order but of jurisdiction. His pronouncements are regarded as infallible when he defines a doctrine regarding faith and morals to be held by the whole church.

The office of pope is elective (see CONCLAVE), and lasts during the life of the occupant, although he may renounce his dignity. When the election has taken place the fact is made known by the cardinal dean. Many ceremonies follow, such as coronation and taking possession of the cathedral church of Rome, St John Lateran. This latter ceremony is not strictly necessary, for after his coronation the pope enjoys the papal power in all its plenitude; but its object is his enthronization as bishop of the city and diocese of Rome and patriarch of the West. The cardinals are the princes and senators of the church, counsellors of the pontiff, co-operators with him, and vicars in the functions of the pontificate (see CARDINAL). To Pope Evaristus, fifth successor of St Peter, is attributed the creation of the first *titles* or parishes of Rome, the occupants of which were afterwards known as cardinals. At the beginning of the 3d century twenty-five of these titles existed. In the course of time they were increased to fifty and afterwards to seventy. In the *Gerarchia Cattolica* the titles are thus divided: suburban sees (cardinal bishops), 6; titular churches (cardinal priests), 52; and diaconates (cardinal deacons), 16; making a total of 74. The cardinalate, in the sense at present attached to it, is different from what it was in earlier ages, being now the highest dignity after the papacy. The greater part of the administration of the church—the chief subject of this article—is directed by the cardinals who are members of congregations, which correspond, in a certain measure, to the political ministries in modern states. These congregations are established in Rome by the sovereign pontiff, and their objects are to inquire into, discuss, and decide the important affairs of the whole church and of the temporal dominions of the holy see. The cardinals are assisted by consultors or prelates, by distinguished ecclesiastics secular and regular, and by other officials appointed by the pope.

The head of every congregation is a cardinal prefect, though some congregations have the pope as prefect, e.g., the holy office, the apostolic visit, and the consistory. The secretary is ordinarily a prelate; in the holy office he is a cardinal. The acts, decrees, rescripts, and letters issued in the name of a congregation are subscribed generally by the prefect, and always by the secretary. These two officials chiefly regulate the affairs of the congregation and submit to the pope, at periodical audiences, the matters which require his approval. The following are the more important congregations:—inquisition, consistorial, apostolic visit, bishops and regulars, council, residence of bishops, state of regulars, ecclesiastical immunities, propaganda fide, propaganda fide for Oriental affairs, commission

for correction of books of the Oriental Church, index, sacred rites, ceremonial, regular discipline, indulgences and relics, examination of bishops, *fabbrica* of St Peter's, extraordinary ecclesiastical affairs and studies. The congregation of the *Holy Roman Inquisition* or *Holy Office* (see INQUISITION) occupies the first place in regard to the quality of the matters of which it treats, as well as from its antiquity. Its object is the extirpation of heresies. It was formally established by Innocent III. (1198-1216), on the suggestion of St Dominic. The following class of cases falls within its judgment:—crimes of heresy and heretical blasphemy, simultaneous polygamy, robbery of the sacred particles accompanied by insult offered to the same, solicitations *ad turpia* with abuse of sacramental confession, affected sanctity, contempt of sacred images, divination and sorcery, retention and reading of heretical books, &c. This congregation also proceeds against any one who, having been baptized, returns to paganism; against any one who celebrates mass or hears confessions, not being a priest; against false witnesses who depose in causes of faith, &c. Its authority extends, in matters of faith, over every person of whatsoever grade, condition, or dignity, whether bishops, magistrates, or communities, and no local or personal privilege exempts from its jurisdiction. Bishops, according to the council of Trent, being subject to the pope only, the Inquisition may institute inquiries, but may not pronounce sentence, this being reserved to the pontiff. *Consistorial*, instituted by Sixtus V., 1587, considers and judges on matters appertaining to the erection of new metropolitan or cathedral churches, or their limits; instances of bishops who desire to resign their churches; matters relating to chapters and the confirmation or exclusion of subjects elected by them to metropolitan, episcopal, or monastic dignities; the examination of coadjutors; presentations or nominations of bishops made by sovereign princes and republics; concession of rights to the pallium; retention of dignities and major benefices incompatible with episcopal rights, and suchlike. The *Apostolic Visit* insists on the observance of that decree of the council of Trent which enjoins, as a duty, that every bishop shall visit in person or by means of a delegate the churches, pious institutions, &c., in his diocese. *Bishops and Regulars*: this congregation has to do chiefly with the government of monasteries and with complaints from the inmates of these against bishops. It examines new institutions and their constitution; the founding of new monasteries for both sexes, and the removal of subjects from one monastery to another; questions regarding the alienation of the ecclesiastical property of regulars; differences between ordinaries, parish priests, and regulars; and a variety of questions of a similar nature. The *Council*: the fathers of the council of Trent, anticipating that doubts might arise concerning the interpretation of the doctrines and decrees published therein, besought Pius IV. to provide in the most fitting manner for such contingencies. This the pontiff did in approving and solemnly confirming the council in the bull *Benedictus Deus* (1563), interdicting, under severe penalties, any person whatsoever, secular or ecclesiastic, from publishing commentaries, glosses, &c., or any interpretation whatsoever, upon the decrees of the council of Trent, it being enacted that all controversies, questions, and doubts should be submitted to the congregation of the council. The object of this congregation, therefore, is the interpretation of these doctrines and decrees. The congregation of *Residence of Bishops* may be considered as auxiliary to that of the council. It treats of the questions which concern the bishops' obligation to reside in their own dioceses,—a most important matter treated of in the council of Trent. Even in 1352 Innocent VI. ordered, under pain

of excommunication, that bishops and other beneficiaries having care of souls should reside in their respective dioceses. Innocent X. forbade cardinals to depart from Rome or its district—that is, a radius of 40 miles—without licence from the pope. The *State of Regulars* was instituted for enforcing on religious orders and congregations the observance of their special rules and constitutions. *Ecclesiastical Immunities* treats of controversies concerning the liberty and independence of ecclesiastical jurisdiction and its violations, and prescribes that the immunities due to churches be respected. This congregation receives appeals of causes which in the first instance were brought before the episcopal courts. The various concordats entered into between Governments and the holy see have diminished the number of causes which come under the judgment of this congregation. For *Propaganda Fide*, see PROPAGANDA. *Propaganda Fide for Oriental Affairs*, which provides for the affairs of the Eastern Church, was created by Pius IX. in a brief dated 6th January 1862. It depends upon the cardinal prefect of Propaganda, but has its own secretary, consultors, and officials. The *Commission for the Correction of Books of the Oriental Church* took its origin from a report made by Philip IV. of Spain to Urban VIII. in 1631, to the effect that the United Greeks inhabiting the Spanish dominions, especially Sicily, complained that schismatics had printed an *Euchologium*, or liturgy of the mass, filled with errors, and he begged the pontiff to provide a remedy for the evil and its consequences. The correction of the *Euchologium* was decreed, and a special congregation—now called commission—composed of five cardinals, assisted by bishops and ecclesiastics of the Oriental Church, was appointed to correct the books of the Oriental Church, and to publish a correct *Euchologium*. The office of the congregation of the *Index* is to examine printed books and works contrary to faith or morals, and to compile an index or list, which is published at intervals, of the works the reading of which is prohibited. The method now followed in the examination and condemnation of books, especially by Catholic authors, was fixed by Benedict XIV. A consultor examines the suspected work, and reports at a meeting of the congregation what it contains contrary to faith, good morals, ecclesiastical jurisdiction, &c. An examination of these passages is made, and it is determined by vote—the cardinals having the decisive vote—whether the book shall be prohibited or corrected. The congregation of *Sacred Rites* was instituted by Sixtus V. in 1587, in order that in all the churches of Rome and the world, and in the pontifical chapel, in masses, divine offices, and everything else regarding divine worship, the ancient ceremonies may be rigorously followed; that if any primitive rite have fallen into disuse it may be restored to its ancient splendour or reformed; that the pontificals, rituals, ceremonials, and all books of sacred rites may be emended and renewed; and that the divine offices of the saints may be examined. Particular attention is likewise given by this congregation to all things concerning the canonization of saints, the celebration of their feasts, so that all may be done in an orderly manner, correctly, and according to the traditions of the fathers. Hence this congregation decides controversies on all these and on cognate matters. Its most serious work consists in processes for the beatification and canonization of the servants of God, the honours paid to saints, and the recognition of martyrdoms suffered for the Catholic faith. Its first cause in this line was that of the twenty-three minor observants martyred in Japan in the pontificate of Urban VIII. One of the rules established by this pope for the recognition of saints enjoins that, except by licence of the congregation, no one can proceed to any act of canonization, beatification, or declaration of

martyrdom until fifty years after the death of the subject. The congregation of *Ceremonial* investigates and watches over the exact fulfilment of the sacred liturgy, and regulates and decides questions and doubts regarding formalities, pre-eminence amongst cardinals, prelates, and others, as well as certain sacred ceremonies in pontifical functions.

The work of the church in the world is directed immediately by the bishops, who receive their jurisdiction from the pope. The power inherent in the episcopal character and order is received from God directly and immediately. When established in a diocese by the pope, the bishop, in virtue of his title, receives the power of governing and of taking cognizance of all spiritual causes which regard his flock, whether laymen or ecclesiastics, with the exception of what is specially reserved to the head of the church, and he possesses and exercises these prerogatives under the jurisdiction of and in dependence on the pope. The bishops in the Catholic Church at the present time are (*Gerarchia Cattolica*, March 1885) thus divided: (a) patriarchal sees, of the Latin rite, 7; of the Oriental rite, 5; (b) archiepiscopal sees, of the Latin rite, immediately subject to the holy see, 14; with ecclesiastical provinces, 137; Oriental rite, with ecclesiastical provinces, 3; subject to patriarchates, 21; (c) episcopal sees, Latin rite, immediately subject to the holy see, 86; suffragans in ecclesiastical provinces, 579; Oriental rite, immediately subject to the holy see, 2; suffragans in ecclesiastical provinces, 8; subject to patriarchates, 41; (d) sees *nullius dioceseos*, 17. The titles dependent on the sacred congregation of Propaganda are—apostolic delegations, 7; vicariates apostolic, 123; prefectures apostolic, 35. The total of these hierarchical titles amounts to 1085, and, including the 74 cardinalitial titles, to 1159. The vacant titles of all kinds amount to 107, and thus the whole hierarchy of the Catholic Church in March 1885 reached the total of 1266. Priests, placed in the second degree of the ecclesiastical hierarchy, who are generally divided into parish priests and curates or assistants, are immediately under the direction of the bishops and administer directly to the people. Their primary office is the offering of the sacrifice of the mass. They also preach, bless, and administer baptism, penance, communion, and extreme unction. Their functions are numerous and important, and they constitute the working force of the church in its direct relations with its members throughout the world. Priests of religious orders exercise like functions, save those properly parochial.

The Oriental churches in communion with the holy see, holding the same belief and the same principle of authority as the Latin Church, have their own special rites, discipline, and liturgical language. These are chiefly the Greek, Melchite, Bulgarian, Ruthenian, Maronite, Syro-Chaldaic, Coptic, Armenian, and Roumanian rites. The Greek Oriental rite is admitted by the pure Greeks, the Slavs (in the Slav language), the Melchites of Syria (in Arabic), the Roumanians (in the Roumanian tongue), and the Georgians (in their own language). The Georgian Greek rite has no hierarchy, and many Georgians in Russia have passed to the Latin or Armenian rites. The Greek and Slav languages are approved by the church as ritual languages; Arabic is only tolerated.

Greeks in Communion.—These are found at present in Constantinople, in the mission of Malgara in Thrace, and consist of about sixty families, having one bishop and about ten priests. In this rite marriage is permitted to clerics previous to the reception of sacred orders; but there is a tendency to abolish the practice. In Greece nearly 30,000 Greeks have followed the Latin rite, and these have seven bishops and about a hundred priests. The mass of St Basil is celebrated by the Greeks ten times a year,—on the three vigils of Christmas, the Epiphany, Easter, Holy Thursday, the Feast of St Basil, and the first five Sundays of Lent. After St Basil, St John Chrysostom abbreviated this mass and gave it the

form which has existed down to the present time amongst all the Orientals who follow the Greek rite.

Melchites.—The Melchites (see MELCHITES) have the Greek rite in the Arab language. They are found scattered throughout Syria, Palestine, and Egypt, and have one patriarch and ten bishops ruling over from 70,000 to 80,000 souls. Their clergy are, for the most part, regular, following the rule of St Basil, and are divided into three congregations,—that of San Salvatore near Saida (Sidon) in Lebanon, with about 300 persons who mostly have the care of souls; the second, of St John the Baptist, is at Scieur in Lebanon, with thirty members; and the third is the congregation of Aleppo, at St George in Lebanon, with forty members between priests and brothers. A small group of secular clergy is attached to the patriarchate. Besides these there are about forty secular married priests throughout the dioceses. The patriarchal residence is Damascus, which has two bishops-vicars,—one in Damascus, the other in Egypt. The ten dioceses are Tyre, Hauran, Saida or Sidon, Ptolemais, Beyrout, Zakle, Baalbec, Emessa, Aleppo, and Tripoli. Thus there are twelve bishops in all.

Bulgarians.—The United Bulgarians have the same Greek rite, with the mass in the Slav language. Their origin dates from 1860, when many prelates and people passed over to the Catholic Church. At present (1885) their numbers are somewhat diminished, amounting to about 9000 souls. They have one archbishop, who resides in Constantinople, a vicar-apostolic for Thrace, who resides in Adrianople, and another vicar-apostolic for Macedonia, who resides in Salonica. The Turkish Government officially recognizes them as Catholics. They are spread amongst the villages in Turkey and especially in Macedonia. Besides these there are in the diocese of Philippopolis about 15,000 Bulgarian Catholics who have embraced the Latin rite. These are administered by a vicar-apostolic of the order of Capuchins.

Ruthenians.—The Ruthenians attribute their conversion to Christianity to St Methodius (860) and his brother St Cyril. The Ruthenian rite is Greek in the vicinity of Greece and Latin in the countries of western Europe. The Slav is the language used in both rites. The Ruthenians are numerous in eastern and western Galicia, in Poland, and in Hungary. In Russia they have two dioceses. In Galicia they number about 2,600,000 with 2000 priests; in Hungary the two dioceses of Eperies and Munkacs count half a million of Catholics. In Galicia they have one metropolitan (Lemberg) and two bishops, in Hungary two bishops, and in Crisio one, with about 200 priests in these three dioceses. They have a Greek Ruthenian college at Rome and another in Vienna.

Maronites.—The greater number of the MARONITES (*q.v.*) are in Lebanon, where the patriarch resides; others are in Syria, in Egypt, and in Cyprus. The patriarchal title is Antioch; the archbishops are those of Aleppo, Archis, Berito, Damascus, Tyre and Sidon, and Tripoli; the bishops of Cyprus, Heliopolis, and Gibail and Botri. The Maronites of Alexandria are administered by a procurator of the patriarch. The population of these dioceses is nearly 400,000. The number of regular priests is about 1200, of secular priests about 600. In Mount Lebanon there are seventy-five convents of men and women. Five colleges or seminaries depend upon the patriarch and four others on the archbishops. In these seminaries the clerics learn Arabic, Syriac, Latin, French, and Italian. The language used in the mass and in the offices of the church is Syriac, that spoken by the people is Arabic.

Syro-Chaldeans.—The Oriental Syrians are called, ecclesiastically, Chaldeans. This name comprises, not only the inhabitants of Chaldea, but also those of Assyria, Mesopotamia, and a part of Persia. To distinguish them from those having other rites equally Syrian, they were exclusively termed Chaldeans by Pope Eugenius IV. (1431-1447). Previous to the council of Florence (1438) they were called Orientals or Syro-Orientals. The Catholic Chaldeans have a patriarch who for a long period has had his residence at Mosul (Mesopotamia), and has the title of patriarch of Babylonia with archiepiscopal jurisdiction over the city of Baghdad. There are five archdioceses—Amida or Diarbekir in Mesopotamia, Seert in Assyria, Salmas and Adorbigana in Persia, Kerkuk (Carcha) in Parthia Assyria, and Amadia in Kurdistan. The dioceses are Mardin and Gezira in Mesopotamia, Zaku in Assyria-Media, Sena in Persia, Bassorah on the Persian Gulf, and Acrida and Zebari in the mountains of Kurdistan. The number of secular clergy in the patriarchate, archdioceses, and dioceses approximates 200. There is a congregation of Antonian monks, having the title of S. Hormisdas, who have an abbot-general, five houses or convents, forty priests, and a hundred monks. The other religious houses bear the names of Mother of God, St George, St Abraham, and St James. The largest number of Catholics is in the diocese of Mosul with Baghdad, 25,000. In all there are over 90,000 Catholics. The language of the mass and church office is Syro-Chaldaic.

Copts.—The Coptic rite prevails throughout all Egypt. At one time there was a liturgy of Lower and another of Upper Egypt. In the former the Memphitic dialect was in use and the Theban dialect in the latter. But as the patriarchs of Alexandria were Greeks they, followed by several churches in Egypt, changed the liturgy into the

Greek language; and after the schism in the 5th century the liturgy became Coptic, as the patriarchs were Copts. There are three liturgies in use at present—that of St Basil, that of St Gregory Nazianzen, and that of St Mark, rearranged by St Cyril of Alexandria. The Theban dialect is no longer used; but the Memphitic still prevails, and in it the offices of the church are recited. The Catholic population is only about 6000, with twenty-two priests, one bishop, and a vicar-apostolic, whose residence is at Cairo.

Armenians.—The Armenians (see ARMENIAN CHURCH) regard St Gregory the Illuminator as their apostle. Pope Benedict XIV. instituted the patriarchate of Cilicia in 1742, and Pius VIII. in 1830 instituted the Armenian Catholic primacy in Constantinople. In 1867 Pius IX. united Cilicia with the primacy of Constantinople, so that the patriarch now bears the title of Cilicia and has his residence in Constantinople. Turkey, Russia, Asia Minor, Armenia (Greater and Lesser), Mesopotamia, Syria, and Egypt have Armenian Catholics, who altogether number 100,000 at the present time (1885). There are ten archbishops and bishops and over 350 priests. They also possess religious orders, the Mechitarists of Venice and of Vienna, and have an Armenian college at Rome and an Armenian seminary at Bzommar in Mount Lebanon. The liturgical language is literary Armenian, and they have a special rite and liturgy. The people speak vulgar Armenian and Turkish. There is an institut of Armenian sisters of the Immaculate Conception at Constantinople to attend to the education of young girls, especially those newly converted.

Roumanians.—As early as the council of Florence the Roumanian metropolitan of Moldavia subscribed the decree of union; but the time had not yet come for an actual union with Rome. In 1700, under the metropolitan Theophilus and his successor Athanasius I., the great national synod of Alba Julia (Fogaras) was held, in which the bishop, the archpriests, and all the clergy of the Roumanian Church of Transylvania “freely and spontaneously by the impulse of God” concluded a union with the Roman Catholic Church. This declaration was signed by the metropolitan, by fifty-four archpriests (*protopapas*), and by 1561 priests. Historians say that 200,000 families were united to Rome on that day. Some afterwards again fell away, but there is at present a great movement prevailing amongst these towards union. The United Catholics are chiefly in Transylvania and Hungary and number about a million and a half, with from 1500 to 1600 priests. In 1854 Pius IX. erected into an ecclesiastical province the United Roumanian Church with an archbishopric, Alba Julia (Fogaras), and three bishoprics. To the diocese of Grosswardein in Hungary was added that of Lugos in the Banat and that of Armenopolis (Samos-Ujvar), which constitute a flourishing ecclesiastical province. For the education of the clergy four places for students were given by Pius IX. in the Greek college at Rome, and they have sixteen places in the central seminary of Budapest. They have two seminaries, one in the metropolitan diocese with fifty and another at Armenopolis with sixty students. In the diocese of Armenopolis the number of souls is 647,666, with 486 parishes and a monastery. In the archdiocese of Alba Julia the number is 361,000, with 729 parishes and 706 priests. At Grosswardein and Lugos the number of Catholics is less. The rite in use is the Greek, but the language is the Roumanian. This is the only rite which employs the vulgar tongue. (P. L. C.)

English Law relating to Roman Catholics.

The history of the old penal laws against Roman Catholics in the United Kingdom has been sketched in the articles ENGLAND and IRELAND.¹ The principal English Acts directed against “popish recusants”² will be found in the list given in the Acts repealing them (7 and 8 Vict. c. 102; 9 and 10 Vict. c. 59). The principal Scottish Act was 1700, c. 3; the principal Irish Act, 2 Anne c. 3. Numerous decisions illustrating the practical operation of the old law in Ireland are collected in Howard's *Cases on the Popery Laws*, 1775. The Roman Catholic Emancipation Act, 1829 (10 Geo. IV. c. 7), although it gave Roman Catholic citizens in the main complete civil and religious liberty, at the same time left them under certain disabilities, trifling in comparison with those under which they laboured before 1829. Nor did the Act affect in any way the long series of old statutes directed against the assumption of authority by the Roman see in England. The earliest of these which is still law is the Statute of Provisors of 1351 (25 Edw. III. st. 4). Most of what has been already stated

¹ See also Stephen's *History of the Criminal Law*, vol. ii. p. 483; Anstey, *The Law affecting Roman Catholics*, 1842.

² A recusant signified a person who refused to duly attend his parish church.

under NONCONFORMITY (*q.v.*) as to the legal position of nonconformity may be applied to the Roman Catholic faith. The effect of 2 and 3 Will. IV. c. 115 is to place Roman Catholic schools, places of worship and education, and charities, and the property held therewith, under the laws applying to Protestant nonconformists. The Toleration Act does not apply to Roman Catholics, but legislation of a similar kind, especially the Relief Act of 1791 (31 Geo. III. c. 32), exempts the priest from parochial offices, such as those of churchwarden and constable, and from serving in the militia or on a jury, and enables all Roman Catholics scrupling the oaths of office to exercise the office of churchwarden and some other offices by deputy. The priest is, unlike the nonconformist minister, regarded as being in holy orders. He cannot, therefore, sit in the House of Commons, but there is nothing to prevent a peer who is a priest from sitting and voting in the House of Lords. If a priest becomes a convert to the Church of England he need not be re-ordained. The remaining law affecting Roman Catholics may be classed under the following five heads.

(1) *Office.* There are certain offices still closed to Roman Catholics. By the Act of Settlement a Papist or the husband or wife of a Papist cannot be king or queen. The Act of 1829 provides that nothing therein contained is to enable a Roman Catholic to hold the office of guardian and justice of the United Kingdom, or of regent of the United Kingdom; of lord chancellor, lord keeper, or lord commissioner of the great seal of Great Britain or Ireland or lord lieutenant of Ireland; of high commissioner to the General Assembly of the Church of Scotland, or of any office in the Church of England or Scotland, the ecclesiastical courts, cathedral foundations, and certain colleges. The disability in the case of the lord chancellor of Ireland was removed by statute in 1867, with necessary limitations as to ecclesiastical patronage, and the office has been held twice since that date by the late Lord O'Hagan. The Act of 1829 preserved the liability of Roman Catholics to take certain oaths of office, but these have been modified by later legislation (see 29 and 30 Vict. c. 19; 30 and 31 Vict. c. 75; 31 and 32 Vict. c. 72). Legislation has been in the direction of omitting words which might be supposed to give offence to Roman Catholics.

(2) *Title.* The Act of 1829 forbids the assumption by any person, other than the person authorized by law, of the name, style, or title of an archbishop, bishop, or dean of the Church of England. The Ecclesiastical Titles Act, 1851, went further and forbade the assumption by an unauthorized person of a title from any place in the United Kingdom, whether or not such place were the seat of an archbishopric, bishopric, or deanery. This Act was, however, repealed in 1867, but the provisions of the Act of 1829 are still in force. (3) *Religious Orders.* It was enacted by the Act of 1829 that "every Jesuit and every member of any other religious order, community, or society of the Church of Rome bound by monastic or religious vows" was, within six months after the commencement of the Act, to deliver to the clerk of the peace of the county in which he should reside a notice or statement in the form given to the schedule to the Act, and that every Jesuit or member of such religious order coming into the realm after the commencement of the Act should be guilty of a misdemeanour and should be banished from the United Kingdom for life (with an exception in

favour of natural-born subjects duly registered). A secretary of state, being a Protestant, was empowered to grant licences to Jesuits, &c., to come into the United Kingdom and remain there for a period not exceeding six months. An account of these licences was to be laid annually before parliament. The admission of any person as a regular ecclesiastic by any such Jesuit, &c., was made a misdemeanour, and the person so admitted was to be banished for life. Nothing in the Act was to extend to religious orders of females. These provisions exist *in posse* only, and have, it is believed, never been put into force. (4) *Superstitious Uses.* Gifts to superstitious uses are void both at common law and by statute. It is not easy to determine what gifts are to be regarded as gifts to superstitious uses. Like contracts contrary to public policy, they depend to a great extent for their illegality upon the discretion of the court in the particular case. The Act of 23 Hen. VIII. c. 10 makes void any assurance of lands to the use (to have obits perpetual) or the continual service of a priest for ever or for threescore or fourscore years. The Act of 1 Edw. VI. c. 14 (specially directed to the suppression of chantries) vests in the crown all money paid by corporations and all lands appointed to the finding or maintenance of any priest or any anniversary or obit or other like thing, or of any light or lamp in any church or chapel maintained within five years before 1547. The Act may still be of value in the construction of old grants, and in affording examples of what the legislature regarded as superstitious uses. Gifts which the courts have held void on the analogy of those mentioned in the Acts of Henry VIII. and Edward VI. are a devise for the good of the soul of the testator, a bequest to certain Roman Catholic priests that the testator may have the benefit of their prayers and masses, a bequest in trust to apply a fund to circulate a book teaching the supremacy of the pope in matters of faith, a bequest to maintain a taper for evermore before the image of Our Lady. The court may compel discovery of a secret trust for superstitious uses. Since 2 and 3 Will. IV. c. 115 gifts for the propagation of the Roman Catholic faith are not void as made to superstitious uses. It should be noticed that the doctrine of superstitious uses is not confined to the Roman Catholic religion, though the question has generally arisen in the case of gifts made by persons of that religion. The Roman Catholic Charities Act, 1860, enables the court to separate a lawful charitable trust from any part of the estate subject to any trust or provision deemed to be superstitious. It also provides that in the absence of any written document the usage of twenty years is to be conclusive evidence of the application of charitable trusts. (5) *Patronage.* A Roman Catholic cannot present to a benefice, prebend, or other ecclesiastical living, or collate or nominate to any free school, hospital, or donative (3 Jac. I. c. 5). Such patronage is by the Act vested in the universities, Oxford taking the city of London and twenty-five counties in England and Wales, mostly south of the Trent, Cambridge the remaining twenty-seven. The principle is affirmed in subsequent Acts (1 Will. and Mary, sess. 1, c. 26; 12 Anne, st. 2, c. 14; 11 Geo. II. c. 17). If the right of presentation to an ecclesiastical benefice belongs to any office under the crown, and that office is held by a Roman Catholic, the archbishop of Canterbury exercises the right for the time being (10 Geo. IV. c. 7, s. 17). No Roman Catholic may advise the crown as to the exercise of its ecclesiastical patronage (*ib.*, s. 18). A Roman Catholic, if a member of a lay corporation, cannot vote in any ecclesiastical appointment (*ib.*, s. 15). Grants and devises of advowsons, &c., by Roman Catholics are void, unless for valuable consideration to a Protestant purchaser (11 Geo. II. c. 17, s. 5). Where a *quare impedit* is pending before any court, the court may compel the patron to take an oath that there is no secret trust for the benefit of a Roman Catholic. See *QUARE IMPEDIT*. (J. Wt.)

ROMANCE

ROMANCE¹ in its widest sense includes the entire literature of fiction, as well as the early narrations in which fact and legend were blended in historical form, before the simple minds of the people had acquired a clear conception of their distinctness. There are, however, certain ill-defined limitations in the analysis of fiction which enable us to assign distinct places to the legend, the ballad, the epic, the fable, the tale, the romance, and the novel. As usual in all attempts at precise classification, we find that the lines of demarcation cannot be

drawn with rigid exactness, and that many works may be referred to more than one division. But the general conception of romance is the one which will here be followed, and which roughly divides the subject into (i.) *Romances of Chivalry*—chiefly their prose forms—and (ii.) the *Romances of Love and Adventure*, which follow them.

Romance, as a distinct branch of the literature of fiction, belongs essentially to the Middle Ages and to Europe. The romance of chivalry, as it is called, prevailed during the four centuries of knighthood, and there can be little doubt that the institutions of chivalry were considerably influenced by the works of the early romancers. The establishment of the orders of St John and the Temple was based upon an exalted conception of duty and devotion, which the hard test of experience soon modified, and which would have perished utterly but for the em-

¹ In the 9th century the Romana or Romance language made its first appearance in writing. For many centuries, however, it was only used to embody the tales and ballads of each country in which one or other form of the speech was vernacular, so that the word "romance" became finally appropriated to the compositions which were the staple literature of the *Lingua Romana* or *Romance*.

podiment of its ideal in the Round Table romances. The characters of Galaad and the original Perceval represent types of unattainable perfection, and were therefore models which, although commanding reverence, failed to excite as deep an interest as did the second Perceval, Sir Lancelot, Sir Tristan, and Sir Gawain. In these the noblest qualities were blemished by human frailties, and, as a necessary consequence, the knights miscarried a little below the summit of perfect achievement. Walter Map cannot be sufficiently eulogized for the tact and skill with which he drew the two first-named personages. Galaad is brought upon the stage for but a very short time, and is then dismissed in a blaze of saintly glory, while Perceval, although adapted from the French writer's purer knight of that name, is allowed a much larger space upon the canvas, at the cost of a few minor sins which suffice to ensure his failure and to prove him a man. The other knights are brave, generous, self-sacrificing, and devout, but the indispensable virtue of chastity is absent from their lives, and they are foredoomed to misfortune. The perfect ideal, however, underlies the description of all their acts and motives, and the reader or hearer was never allowed to forget it amid the more powerful attractions of the story.

The real prototype of the chivalric romance was the ancient epic: the Greek and Latin poems upon the winning of the Golden Fleece, the siege of Troy, the wanderings of Ulysses and of Æneas, furnish the truest parallel to the mediæval romances of knighthood. The tales which are usually dignified with the name of "classical romances" have really no claim to that rank; they were produced in the age of decadence and correspond much more closely to the mediæval *fabliau* and the 17th-century novel than to the romance proper. As a matter of course every nation had its legends and popular tales, co-existent with literary works of greater importance; but the Greeks at least, and the Romans following their example, never condescended during their ages of intellectual vigour to put such figments into written form, so that even the famous Milesian tales are now quite lost. It was not until the Greeks became a widely dispersed, a subject and deteriorated race, and not till the strength and manhood of Rome were buried in the slough of imperial corruption, that sophists and rhetoricians began to construct those artificial tales which we call Greek and Latin romances. They form, however, an epoch, as the earliest prose works of imagination in a European language, and cannot therefore remain unnoticed here. They were succeeded in time by Christian narratives, usually woven into the lives of saints or used as illustrations in the sermons of great preachers; these latter formed a transition to the semi-religious story of the Grail, a bowl or goblet confounded with the chalice used at the Last Supper, with the cup used to collect the precious blood of our Lord, and symbolically with the Holy Sepulchre itself. The achievers of the Grail-quest, or kings of the Grail, were typified in the Knights Templars and the Knights of St John; thus the true school of romance arose in intimate connexion with the changes in European life and manners which were brought about by the crusades.

Fabliaux. The *chansons de geste*, which constituted a poetical introduction to the romances of chivalry in France, were followed by the *fabliaux*, metrical novelettes which furnished material to the Italian writers of prose tales in the 14th and 15th centuries,—a form of composition which was not acclimatized elsewhere than in Italy till the 16th century, and which then became the remote prototype of the modern novel. The older and nobler knighthood blossomed in France for the last time in Bayard, in England in Sir Philip Sidney; but the genuine literature of chivalric romance may be said to have come to an end with the

15th century. The knightly romances produced in the 16th century were belated and artificial examples of their class; and, although the effects of the conquest of Granada and the discovery of America did not wholly put an end to the lingering romantic spirit in Spain, it hardly survived them for half a century. Hence the inferior character of most of the *libros de caballerias*, which chiefly date from the 16th century. Out of them grew the fictions known as 16th and 17th century romance in Spain, France, and England,—monstrous and uninviting examples of perverted ingenuity, utterly dissonant from the literature of pure romance as we conceive it in the chivalrous fictions of the 12th, 13th, and 14th centuries. A more practical and utilitarian spirit set in with the latter half of the 17th century, in which readers found themselves out of sympathy with the imaginative and mysterious atmosphere of romance. Accordingly the modern novel arose, a form of composition in which the manners and customs of everyday life were more or less faithfully depicted, and which has remained in undiminished popularity to the present time.

The subject will be dealt with in the following order:—I. Greek and Latin romance, under the subdivisions—(a) classical and post-classical prose fictions and (b) pseudo-classical works. II. Mediæval romance, embracing—(a) the Arthurian cycle, (b) the Charlemagne cycle, (c) the Spanish cycle, (d) Teutonic and Anglo-Danish, and (e) unaffiliated. III. Modern romance to the 17th century.

I.—GREEK AND LATIN ROMANCE.

(a) *Classical and Post-Classical Prose Fictions.*

Although the distance in manner is immense between Prose. the *Ass* of Lucian and the *Amadis de Gaula*, and again between the latter and *Ivanhoe* or *Eugénie Grandet*, there are few varieties of modern fiction which are not faintly shadowed forth in the literatures of Greece and Rome (including in this denomination the post-classical periods of Italy and Byzantium): fables and tales, historical, philosophical, and religious novels, love-stories and narratives of adventure, marvellous voyages, collections of fictitious letters—all forms are represented. As even the Andaman Islander and the Bushman have their stories, it is reasonable to suppose that the Greek, who attained a high state of civilization at an extremely remote period, had long been familiar with this method of intellectual gratification. Artistic form was first given to the higher class of such narrations by the Ionians of the Asiatic colonies, when they sang the deeds of gods and heroes in epic poetry and put together the story of Troy now current under the name of Homer. From the Attic Greeks belonging to the same stock came the drama in its highest development,—a fresh step in the representation of events in oral shape. Greek romance is a double misnomer. First, the word "romance" is wrongly applied to the tales we shall shortly discuss; and secondly, we have no right to call anything in art or literature Greek unless it was produced before the time of Alexander the Great, either in Hellas or Ionia or Sicily, or, say, between 800 and 300 B.C. After the defeat of the Greeks at Chæroneia, Macedonia became the ruling centre, and the free political life of the Greek cities passed away. The conquests of Alexander, a Græco-Albanian monarch, spread Greek civilization throughout the known world, but crushed Greece proper out of existence. This civilization (see GREECE, vol. xi. p. 136 *sq.*), influencing peoples foreign to the Greek race, is designated Hellenistic as opposed to the Hellenic, and the chief note of Hellenistic literature is that of imitation. The original springs of Hellenic poetry were dried up, and from the 3d century B.C. the newly

affiliated peoples, whose centre was Alexandria, expressed their fancies in novels rather than in epics.

When, about the 1st century of the Christian era, verse gave place in general favour to rhetorical prose the greater ease of the style lent itself to more detailed narratives than the eclogue and love-poem; and the sophist who might formerly have devoted his attention to poetry became in the decadence of Greek literature a writer of novels. From this period to the 10th century were published the works it is now proposed to analyse. The Greek novel being a late, and it must be confessed an inferior, kind of prose, it would be well if one could trace its rise, progress, and development. This is, however, impossible here; it is sufficient to refer in passing to the fables of primitive invention, the tales inserted by historians, the *Atlantis* of Plato, the *Cyropædia* of Xenophon, the forged histories of Alexander, the fictitious lives of eminent men, the fabulous voyages,¹ and the apocryphal sacred books of Christians and Jews, as supplying in turn material for building up the highly artificial novel which we find first represented by Iamblichus. One element may, however, be spoken of specially, although it is rather a forerunner of the *tale* as distinct from the *novel* or *romance*. The Ionic Greeks, living under an Asiatic sky and corrupted by Oriental luxury, were the first to cultivate to any extent that kind of literature which, without demanding any intellectual labour, tickles the fancy by voluptuous pictures told in a brief and witty manner. Miletus was especially famous for such tales; hence they were usually known as Milesian (*Μιλησιακά*). What was their exact shape it is difficult to say, as they have entirely perished, leaving only the reputation of the universal favour they enjoyed. Perhaps the story of the Ephesian matron told by Petronius in the *Satiræ*, and (though less likely) that of Cupid and Psyche in the *Asinus* of Apuleius, are more closely allied to them than anything we now possess. They must be considered as a natural growth of the imagination, although some may have been contributed by Orientals or Egyptians; and, while forming a portion of the materials upon which the later Hellenistic novel was constructed, they differed widely from it in form and matter. Ovid cannot be considered as a person easily shocked, yet in two passages of the *Tristia* he says—

“Junxit Aristides Milesia crimina secum” (*Trist.*, ii. 413).

“Vertit Aristiden Sisenna, nec obfuit illi

Historiæ turpes inseruisse jocos” (*ib.*, 443-444).

Plutarch (*Crassus*, 32) refers to the fact of a copy of this very translation by L. Cornelius Sisenna (a contemporary of Sulla) having been found in the baggage of a Roman officer, which gave occasion for Surenas to animadvert upon the Romans carrying with them infamous books during war time. This testimony gives sufficient indication of the nature of the Milesian tales. They must have been short and witty anecdotes, turning chiefly upon the subject of love in its grosser form, and may be regarded as the prototypes of the Italian *novelle* and the Provençal and French *fabliaux*. All that remains to us consists of the names of a few writers and some imitations and translations. The best-known writer whose fame has reached us is Aristides of Miletus, though we are ignorant of his life and even of the age in which he lived. A more recent author of the same class was Clodius Albinus, the rival of Septimius Severus. We also hear of Ephesian, Cyprian, and Sybaritic tales, the last almost as

famous as those of Miletus. Aristophanes (as well as Ovid) specially refers to them. Yet after all they exercised but little influence upon the Hellenistic novel beyond perhaps furnishing the more indecent incidents. The lost *Ἔρωτικά* of Clearchus of Soli, a pupil of Aristotle, may have been more closely connected with that branch of our subject. The love-stories (*Περὶ ἐρωτικῶν παθημάτων*) of Parthenius of Nicea are also different. They consist of thirty-six brief tales ending in an unfortunate manner, and were dedicated to Cornelius Gallus as forming subjects for poetical treatment. The author carefully indicates the sources whence he took them, thus giving a special value to his collection. He informs us that some were derived from “the Milesian adventures” of Hegesippus, and also mentions Naxian, Pallenian, Lydian, Trojan, and Bithynian tales. Like Parthenius, Conon was of the Augustan age, and compiled a collection of fifty narratives (*Διηγήσεις*) of heroic times, relating chiefly to the foundation of colonies. They are analysed by Photius. Cervantes has used one of them in *Don Quixote*.

The first we hear of the Greek or Hellenistic novel is in Greek the time of Trajan (c. 110), when Iamblichus, a Syrian by descent and a freeman, born and educated at Babylon, wrote in Greek his *Babylonica*, which is known from Suidas, Photius, and a scholium discovered by Henry Estienne on an ancient MS. of the latter writer. A complete codex existed in 1671; and a considerable fragment has been reprinted by Mai (*Nova Coll. Script. Vet.*, ii. 349, &c.). Suidas states that the *Babylonica* consisted of thirty-nine books, but Photius, who gives a full abstract (*Bibliotheca*, cod. 94), only mentions seventeen. The story is that of Sinonis and Rhodanes, married lovers, persecuted by Garmus, king of Babylon, who is fascinated by Sinonis. They fly, and are pursued by the royal eunuchs, who give them no peace through many adventurous scenes. A remarkable resemblance between the fugitives and another couple, Euphrates and Mesopotamia, is the chief subject of the plot. We now meet, incorporated in the works of writers whose dignity might be supposed above the suspicion of story-telling, short tales of a didactic nature, such as those given by Plutarch under the title “On the Virtues of Women.” Dion Chrysostom, the most eminent of the rhetoricians and sophists, has also left among his orations a short novel called *The Hunter*. The narrator is supposed to have been wrecked on the shores of Eubœa and meets a hunter who tells him his history. Two married couples (the hunter and his wife being one) were living in friendly solitude, when one day a stranger came, and asking for money received all the recluses were able to give in the shape of two deerskins. The hunter goes to the city with the traveller, and his first impressions are happily told. He is frightened by the bustle and excitement, and debates with an idler upon the comparative advantages of town and country life. The return home is very delicately drawn. Lucian of Samosata, one of the chief essay-writers of the post-Christian age, has left two romances, *Lucius or the Ass* and the *True History*, both of which have been briefly analysed in the article LUCIAN (vol. xv. p. 43). The former was considered by Photius (cod. 129) to have been taken from a fable by Lucius of Patræ and to have thus had a common origin with the *Asinus* of Apuleius; others consider Lucian himself to have been the original inventor of the story. The *True History* has been drawn on by Rabelais, Cyrano de Bergerac, Swift, and the author of *Baron Munchausen*. Like the productions of more modern satirists, it loses much of its point and meaning when the allusions upon which the chief interest is based can no longer be understood. Rather of the nature of the fictitious voyage was *The Wonders beyond Thule* of Antonius Diogenes, only known from the account given by Photius

¹ Strabo considered all those who had written about India down to his time as mere fictionists, and at their head he placed Daimachus and Megasthenes. From the analysis furnished by Diodorus Siculus (ii. 55-60) of the *Fortunate Island* of Iambulus we are led to believe that the writer, who lived before the 1st century, intended the work as a kind of social utopia similar to the *Atlantis*,—full of marvels and surprises like all the other imaginary voyages.

(cod. 166), who was of opinion that he belonged to a remote age, shortly after Alexander, and that he served as model to all subsequent writers of romance, including Lucius. A preliminary letter to a friend, Faustinus, indicates by the Latin name a much later origin. The heroes visit the Celts and the Aquitanians, both unknown to the Greeks at an early period. Certain paragraphs of the life of Pythagoras by Iamblichus are nearly identical with passages in Diogenes, who in his turn has similar correspondence with parts of Nicomachus Gerasenus, who lived under Tiberius. The natural inference is that all three writers copied from the same source. Modern authorities place Diogenes at the beginning of the 3d century. The recitals of their travels given by the Arcadian Dinias, the Phœnician Dercyllis, and her brother Mantinias are such as would be imagined by persons who had never left their native hamlet. The itinerary of the routes followed by the different personages is extremely confused. By Thule the writer probably understood Iceland or Norway, deriving his information from Pytheas.

Erotic
romances. The Latin *Apollonius of Tyre* is undoubtedly derived from a lost Greek original, and therefore claims a place here, as representing one of the earliest love-stories we can assign to that literature. It may date from the 3d or 4th century, and was perhaps translated into Latin verse in the 5th century. What we now possess (beyond the Anglo-Saxon version mentioned below) is a second Latin prose translation made in the 12th or 13th century. The first mention of the work is in a list of books belonging to Wando, abbot of Fontanelle (742), in the diocese of Rouen. The story runs that Antiochus, king of Syria, entertaining an undue affection for his daughter Tarsia, keeps off suitors by an unsolvable riddle. But Apollonius, king of Tyre, discovers the answer, is obliged to fly, and (as well as Tarsia) undergoes many trials from pirates and other persecutors. An abridgment is included in the *Gesta Romanorum*. An ancient Anglo-Saxon translation was printed by Thorpe in 1834. Gower derived his adaptation in the *Confessio Amantis* (bk. viii.) from the rhymed redaction of Godfrey of Viterbo (1185). This formed the foundation of Shakespeare's *Pericles* (1609). The earliest English version (1510) is made from the French *Appollyn, Roy de Thire*.

The author of the *Cyropædia* has already been alluded to. Suidas mentions other writers of fictions of the name of Xenophon,—a native of Antioch, who wrote *Babylonica* like Iamblichus; a native of Cyprus, who composed a similar book under the title of *Cypriaca*; and Xenophon of Ephesus, of whom alone we possess anything. This last is the author of the romance *Ephesiaca*, or the *Loves of Anthia and Abrocomas*, of which the Monte Cassino MS. (first published in 1726) is the only one extant. His age is unknown: by Locella, one of his editors, he is placed in the time of the Antonines; Peerlkamp, another editor, considers him to be the oldest of the romancers writing in Greek, and that similar writers imitate him closely. Some go so far as to regard him as an imitator of Achilles Tatius and of Heliodorus, and bring him down to the 5th or 6th century. The story runs that Anthia and Abrocomas are married, and, being forbidden by an oracle to travel, of course do so, and are captured by pirates, who take them to Tyre, where Manto, daughter of the chief, falls in love with Abrocomas. Repelled by him, she marries Moeris and accuses Abrocomas of an attempt to violate her. Moeris in his turn pays improper attentions to Anthia. The great beauty of the hero and heroine causes them many trials at the hands of pirates, brigands, and other stock ornaments of the Greek novel. The local names of the tales of Iamblichus and Xenophon were probably suggested by the *Μιλησιακά* collected by the earlier writers Dionysius and

Aristides of Miletus. This is the weakest of the class we have under review; its only merit lies in a simple and natural style. By far the best of the romances is the *Æthiopica* of HELIODORUS of Emesa (q.v.). From its first appearance and throughout the whole Byzantine period this work enjoyed a reputation which it has not entirely lost. Within recent times three Frenchmen of mark have praised it,—Amyot, who translated it; Racine, with whom it was a favourite; and Boileau, who compared it with the *Télémaque* of Fénelon. It influenced considerably the French romance-writers of the 17th century, D'Urfé, Gomberville, and Mademoiselle de Scudéry. The dénouement is imitated in the *Pastor Fido* of Guarini; Tasso drew from it the early life of Clorinda in *Gerusalemme Liberata*; and Raphael painted scenes from it. It was first brought to light in modern times in a MS. from the library of Matthias Corvinus, found at the sack of Buda (Ofen) in 1526, and printed at Basel in 1534. Other codices have since been discovered. The title is taken from the fact that the action of the beginning and end of the story takes place in Æthiopia. The daughter of Persine, wife of Hydaspes, king of Æthiopia, was born white through the effect of the sight of a marble statue upon the queen during pregnancy. Fearing an accusation of adultery, the mother gives the babe to the care of Sisi-mithras, a gymnosophist, who carries her to Egypt and places her in charge of Charicles, a Pythian priest. The child is taken to Delphi, and made a priestess of Apollo under the name of Chariclea. Theagenes, a noble Thes-salian, comes to Delphi and the two fall in love with each other. He carries off the priestess with the help of Calasiris, an Egyptian, employed by Persine to seek for her daughter. Then follow many perils from sea-rovers and others, but the chief personages ultimately meet at Meroe at the very moment when Chariclea is about to be sacrificed to the gods by her own father. Her birth is made known, and the lovers are happily married. The rapid succession of events, the variety of the characters, the graphic descriptions of manners and of natural scenery, the simplicity and elegance of the style, give the *Æthiopica* great charm. Its chaste tone compares favourably with many of the other works of the same class.

Perhaps the most widely known is the delightful pastoral of *Daphnis and Chloe* (or *Λαοβιακά*), generally attributed to Longus, a Greek sophist, who is supposed to have lived in the 4th or the early part of the 5th century. Longus shows traces of an imitation of the *Æthiopica* of Heliodorus, with whom he may be placed in the first rank of such writers. His work formed the model of the *Sireine* of Honoré d'Urfé, the *Diana* of Montemayor, the *Aminta* of Tasso, and the *Gentle Shepherd* of Allan Ramsay, and has been translated into every European language. The translation of Amyot, afterwards revised by P. L. Courier, has made it extremely popular in France, where the subject has frequently been made use of by Gérard and other painters. The celebrated *Paul et Virginie* is an echo of the same story. Daphnis and Chloe, two children found by shepherds, grow up together, nourishing a mutual love which neither suspects. The development of this simple passion forms the chief interest, and there are few incidents. Chloe is carried off by the inevitable pirate, and ultimately regains her family. A few rivals alarm the peace of mind of Daphnis; but the two lovers are recognized by their parents, and return to a married and happy life in the country. The picture of rural felicity and the innocent affection of the children make the charm of a book which comes nearer perhaps in spirit to the modern novel than any other of its class. Unfortunately there are details here and there which shock modern ideas of decent propriety. Achilles Tatius or Statius, an Alexandrian rhetorician of

the latter half of the 5th or beginning of the 6th century, wrote *The Adventures of Leucippe and Cleitophon*, upon the model of Heliodorus; though an ingenious story, it does not reach the standard of the work it imitates. Like his predecessor, Achilles uses the marvellous with discretion, but the accumulation of difficulties is very tedious. Leucippe and Cleitophon fall in love and fly to escape parental anger. They suffer shipwreck, are seized by brigands, and separated. Cleitophon first believes that Leucippe is dead, then finds her, to lose her once more, and again to meet her, a slave, at the very time he is going to marry her mistress, Melitta, a rich Ephesian widow. It so happens that the husband of the latter is not dead but returns to persecute with his love and jealousy both Leucippe and Cleitophon. The descriptions are the best part, the incidents being either tiresome or repulsive and the character of the hero pitiable. Most of the book is written with taste and judgment, but the digressions are too frequent.

Achilles Tatius is the last of these authors who can be said to have the slightest merit. Of the romances which followed his one of the least bad is perhaps *Chæreas and Callirrhoe*, by one who called himself Chariton of Aphrodisias, placed by various authorities between the 5th and the 9th century. Here the two lovers are already married, and as usual are of superhuman beauty. Unfortunately Chæreas possesses a somewhat irritable temper, and on a jealous suspicion gives his lovely wife a terrible kick in the stomach. She is considered dead and is carried to her grave. But during the night brigands carry her away to Ionia, where her purchaser, Dionysius, falls in love with her. The wife remains faithful to her husband, but, as she is *enceinte*, consents to marry Dionysius in order that her child may have a father. Meanwhile Chæreas, having learned the ravishment of the supposed corpse, starts in pursuit of his wife. He also is captured by pirates and taken to Caria. The two finally come together, when Callirrhoe forsakes Dionysius and her son and returns to Sicily with her first husband.

Equally frigid was *The Loves of Hysmine and Hysminias* by Eustathius or Eumathius, probably a Byzantine, who is placed by Wolf as late as the 12th century, but who may have lived six hundred years earlier. Only a few more remain to be mentioned. Philip of Amphipolis wrote *Ῥοδιακά* (specially referred to by Suidas for its obscenity), *Θασιακά*, and other works, all lost. Severus of Alexandria, a man of fortune with a large library, living in the latter part of the 5th century, has left a few short stories after the style of Parthenius. Photius (cod. 130) also preserves the titles of some works by a certain Damascius, such as *Incredible Fictions*, *Tales of Demons*, *Marvellous Stories of Appearances from the Dead*, &c. The same authority tells us (cod. 188) of a writer of the name of Alexander who compiled a book of marvels. The credit of having written the worst of the Greek romances may be claimed either by Theodorus Prodromus, a monk of the early part of the 12th century, for his metrical history, in nine books, of *Rhodanthe and Dosicles*, or by Nicetas Eugenianus, who lived somewhat later, for his iambic poem *History of the Lives of Drusilla and Charicles*, imitated from the former work. Constantinus Manasses (also 12th century) composed a poetical romance on the loves of *Aristander and Callisthia*, fragments of which were first printed by Villoison (*Anecdota Græca*, 1781).

Under BARLAAM AND JOSAPHAT (vol. iii. p. 375) will be found the origin and development of the story by St John of Damascus, which belongs rather to religious apoloques than to romances. Its origin is entirely Eastern, from India. The early Christians eagerly seized upon fiction as affording them a vehicle for spreading their views.

Their contributions to our subject have a strong family likeness, and usually either close with a martyrdom or are written in praise of a monastic life. To the former class belong the *Clementine Recognitions* (2d century), *Paul and Thelkla* (3d century), and *Cyprian and Justina*, which contains the germs of the episode of Faust and Gretchen. The ascetic novels include *Xenophon and his Sons*, *Euphrosyne*, *Zosimus and Mary*, *Thais*, &c. Christian imaginary travels are represented by the *Voyage of Macarius to Paradise* and comic tales by *Agape*, *Irene*, and *Chionia*.

Besides the forged letters attributed to men of mark, we have from the Greek sophists collections of fictitious letters serving the same purpose as the epistolary novels of Rousseau and Richardson. The best known of those writers were Alciphron, Aristænetus, and Theophylactus Simocatta. Alciphron, the most eminent, of whom we possess 116 *Letters* in three books, lived in the 3d or 4th century. Many of the letters are written by courtezans and supply curious information on contemporary life and manners. The fifty *Erotic Epistles* of Aristænetus form a much less entertaining series than those of Alciphron. Theophylactus Simocatta, an Egyptian by birth, died at Constantinople about the year 640. He wrote eighty-five *Letters*, divided into moral, rustic, and amatory. They are little else than brief moral treatises mingled with stories.

The review of the *origines* of the Greek novel shows that it arose with the decay of old Greek literature and carried on a feeble existence down to the 12th century. Two facts make themselves apparent. First, the romance (or novel) proper came late into the field, where it remained in a secondary place; and secondly, it invariably turned upon a hackneyed circle of incidents and never attained anything of the highly artistic development reached by modern examples. The sameness observable in Greek romance arises from the fact that it was the product of literary decrepitude and impotence. The writers were incapable of rivalling the glories of the old Hellenic literature, and they endeavoured to supply originality with reminiscences more or less disguised. The literary and social surroundings in which these authors passed their lives gave them few fresh subjects for investigation, and the characters they describe are mere names. Human nature and the human heart have little meaning for them; but, as with the Western writers of fiction who closely follow them in point of date, incident is crowded upon incident to the verge of satiety, in order that the attention of the reader may never flag.

The contributions of Roman literature are limited to productions by two writers, Petronius and Apuleius and one story by Martianus Capella, of more recent date and less typical nature. In the comic romance of PETRONIUS ARBITER (*q.v.*), the tale of the matron of Ephesus first appears among Western popular fictions. This was undoubtedly one of the Ephesian tales already referred to. We find it reproduced in the *Seven Wise Masters*, in the French *fabliaux*, and in Brantôme. It is also to be found in the Chinese. The opening words of the *Golden Ass* of Apuleius indicate that his romance and the *Ass* of Lucian were both inspired from the same source, perhaps through the medium of Lucius of Patrae mentioned by Photius. Lucian seems to have reproduced the story in a condensed form; the Latin writer paraphrased and embellished it with other tales, among which the best known is that of Cupid and Psyche,—an antique gem in an unworthy setting. The hero, punished for his curiosity by being turned into an ass, passes through adventures similar in kind to those depicted in the Greek romance. The story ends with a fine description of the mysteries of Isis, into which the hero is initiated and through

which he becomes purified. The first two books of the cyclopædia of the 5th century, the *Satyrice* of Martianus Capella, known as *De Nuptiis Philologiae et Mercurii*, form a kind of philosophico-allegorical romance in prose mingled with verse. Mercury, wishing to marry, goes, accompanied by Virtue, to Apollo on Parnassus and finds him occupied in taking from four urns the elements of all things. Apollo proposes that Mercury should marry Philology, but the consent of Jupiter must be asked. Jove hesitates and assembles a council of the gods to decide the question. The request is granted and Philosophy transcribes a decree permitting mortals of superior merit to be admitted among the gods. The second book is devoted to the marriage. At first Philology has fears as to its advisability, and the Muses form a chorus by whom she is admonished. She is visited by Prudence, Justice, Temperance, and the three Graces. At last the bride goes to Mercury's house and all set out for the palace of Jupiter, who receives them surrounded by the gods and many deified mortals.

Of these three works the last does not comply with all our conditions, and of the first two Apuleius is after all merely a translator. The *Satyrice* of Petronius is thus the sole genuine representative of Latin prose romance. When compared with the Greek compositions it will be found to offer a remarkable variation. In the *Satyrice* we at once come in contact with contemporary scenery and habits; the characters have well-marked individuality; and the book is full of life. It must not, however, be considered merely as a novel; its chief object was to satirize the manners of the time. The same tendency to draw a strongly marked picture of the vices and follies of the hour appears also in the *Asinus*. In the qualities of vigour, interest, and originality of form and substance Apuleius and Petronius are far beyond their Greek rivals.

The texts of the *Scriptores Erotici Graeci* have been edited by C. W. Mitscherlich (Zweibrücken, 1792-94, 3 vols. in four parts); by F. Passow (Leipsic, 1824-33, 2 vols. 8vo); in Didot's collection, the most complete (Paris, 1856, la. 8vo); and by R. Hercher (Leipsic, 1858-59, 2 vols. 12mo). The texts of many of the fictitious historians and biographers are given in *Fragmenta Historicorum Graecorum* (Paris, 1841-51, 4 vols. la. 8vo), and *Scriptores de Rebus Alexand. M.* (*ib.*, 1846, 8vo). Photius (*Bibliotheca*, Berlin, 1824, 2 vols. 4to) has analysed a great many writings now lost. Early biographical information (not always trustworthy) is supplied by Suidas, and latterly and more perfectly by Fabricius (*Biblioth. Graeca*). Translations into French are contained in *Bibliothèque des romans grecs, tr. en français* (Paris, 1797, 12 vols. 18mo); *Collection de romans grecs, tr. avec des notes par Courier, Larcher, &c., précédée d'un essai sur les romans grecs par M. Villemain* (Paris, 1822, 12 vols. 18mo, unfinished); *Romans grecs, tr. en fran. par Ch. Zevort, précédés d'une introduction sur le roman chez les grecs* (Paris, 1856, 2 vols. sm. 8vo). In Italian we have *Erotici greci* (Florence, 1814-17, 6 vols. 8vo), and in English, *Greek Romances*, by C. Smith (1855, sm. 8vo). The general authorities are referred to under GREECE (vol. xi. p. 147). The following are special treatises on the subject:—J. C. F. Manso, "Ueber den griech. Roman," in his *Verm. Schriften* (Leipsic, 1801); F. Jacobs, "Conjecturae de locis nonnullis Achillis Tatii," &c., in Wolf's *Litt. Analecten* (Berlin, 1820); Wiedemann, "Der gr. Roman," in *Arb. der kurländ. Ges.*, 1848, hft. 3; R. Hercher, "Zur Litt. d. gr. Erotiker," in *Jahrb. f. class. Phil.*, 1858, vol. lxxvii.; O. Jahn, "Eine antike Dorfgeschichte," in *Aus d. Alterthumsw.*; H. Peter, "Der Roman bei den Griechen," in *Neues Schweiz.*, 1866; A. Nicolai, *Ueber Entstehung u. Wesen d. gr. Romans* (Berlin, 1867, 8vo); B. Erdmannsdörffer, "Das Zeitalter der Novelle in Hellas," in *Preuss. Jahrb.*, vol. xxv.; C. Hartung, "Die byzantinische Novelle," in *Archiv f. d. Stud. d. n. Spr.*, 1872; H. Usener, "Zur Gesch. des gr. Romans," in *Rhein. Mus.*, 1873, vol. xxviii. (N. F.); E. Rohde, "Ueber gr. Novellendichtung," in *Versamml. deutscher Philologen*, 1875; *Id.*, *Der gr. Roman u. seine Vorläufer* (Leipsic, 1876, 8vo); J. Wimmer, "Der gr. Roman," in *Blätter f. d. bayer. Gymn.*, 1877; "Greek Romances," in *For. Quar. Rev.*, Nov. 1829; "Early Greek Romances," in *Blackwood's Mag.*, July 1843; S. Baring Gould, "Early Christian Greek Romances," in *Contemp. Rev.*, Oct. 1877; Chardon de la Rochette, "Notice sur les romans grecs," in *Mélanges* (Paris, 1812, vol. ii.); Struve, "Romans et nouvelles chez les grecs," in *Journal gén. de l'Instr. Publ.*, 18th Aug., 17th Sept., 1835; V. Chauvin, *Les romanciers grecs et latins*

(1864, sm. 8vo); A. Chassang, *Hist. du roman dans l'antiq. grec. et lat.* (1862, sm. 8vo); P. D. Huet, *De orig. fab. rom.* (Hague, 1682); P. Paciaudi, *De Libris Eroticis Antiquorum* (Leipsic, 1803, 8vo); H. Paldamus, *Römische Erotik* (Greifswald, 1833, 8vo).

(b) Pseudo-Classical Works.

The literature of the Middle Ages recognized three great epic cycles, distinctly defined by Jean Bodel (13th century) in his *Chanson des Saisnes* (*i.e.*, Saxons):

"Ne sont que trois matieres, a nul homme entendant—
De France, de Bretagne, et de Rome la Grant;
Et de ces trois matieres n'i a nule semblant."

Under "Rome la Grant" were comprehended the stories of Troy and the Trojans, Æneas, Alexander the Great, Julius Cæsar, Judas Maccabæus, &c., from Latin sources,—that is to say, the whole ancient world seen through the language of Rome.

The romances derived from antiquity may be arranged in three classes—(1) those which were believed to be direct reproductions, such as *Æneas*, *Thebes*, *Cæsar*, and the *Roman de Troie*, whose authors acknowledged indebtedness, after their fashion, to Virgil, Statius, Dares Phrygius, Dictys Cretensis, &c.; (2) those based upon ancient histories not previously versified,—for example, the legend of Alexander from Quintus Curtius and the Pseudo-Callisthenes; (3) those which merely reproduce the names of antiquity and nothing else, such as *Athis et Profilas*, *Ypomedon*, and *Protésilas*.

1. The chief of the first class was the *Roman de Troie*, Legend of Troy, which exercised greater influence in its day and for centuries after its appearance than any other work of the same order. Just as the *chansons de geste* of the 10th century were the direct ancestors of the prose romances which afterwards spread throughout Europe, so, even before the novels of Heliodorus and Achilles Tatius, there were quasi-histories which reproduced in prose, with more or less exactness, the narratives of epic poetry. Among these nothing has ever equalled in vitality the tale of the two sieges and capture of Troy, and the subsequent destinies of the Trojan and Greek heroes. "It would require a large volume," says Grote (*History of Greece*, i. p. 386), "to convey any tolerable idea of the vast extent and expansion of this interesting fable, first handled by so many poets, epic, lyric, and tragic, with their endless additions, transformations, and contradictions, then purged and recast by historical inquirers, who, under colour of setting aside the exaggeration of the poets, introduced a new vein of prosaic invention." Long previous to the Ἡρωικός of Philostratus (2d century) the Trojan War had been the subject of many a prose fiction dignified with the title of history; but to remodel the whole story almost in the shape of annals, and to give a minute personal description of the persons and characters of the principal actors, were ideas which belonged to an artificial stage of literature. This task was commenced by PHILOSTRATUS (*q.v.*), whose Ἡρωικός bears ample traces of having been compiled from a number of current figments. Philostratus, however, only pictures several characters and a few isolated scenes. His method was subsequently followed in a more complete fashion by two anonymous writers, who either borrowed from him or from a more ancient source common to all three. A spurious history, professing to give the chief incidents of the siege, and said to have been written by Dictys of Crete, a follower of Idomeneus, was known as early as the time of Ælian, and has been largely quoted by the Byzantine chroniclers. This was translated into Latin prose at an early period under the title of *Dictyos Cretensis de Bello Trojano libri VI.* With Dictys is always associated Dares, a pseudo-historian of more recent date. Old Greek writers mention an account of the destruction of the city earlier than the Homeric poems, and also in

the time of Ælian this Iliad of Dares, priest of Hephæstus at Troy, was believed to exist. Nothing has since been heard of it; but an unknown Latin writer living between 400 and 600 took advantage of the tradition to compile what he styled *Daretis Phrygii de Excidio Trojæ Historia*. It is in prose, and professes to be translated from an old Greek manuscript. Of the two works that of Dares is the later, and is inferior to Dictys. The matter-of-fact form of narration recalls the poem of Quintus Smyrnæus. Both compilations lack literary merit; the gods and everything supernatural are suppressed; even the heroes are degraded. The long success, however, of the two works distinguishes them above all apocryphal writings, and they occupy an important position in literary history on account of the impetus they gave to the diffusion of the Troy legend throughout western Europe. The Byzantine writers from the 7th to the 12th century exalted Dictys as a first-class authority, with whom Homer was only to be contrasted as an inventor of fables. Western people preferred Dares, because his history was shorter, and because, favouring the Trojans, he flattered the vanity of those who believed that people to have been their ancestors. Many MSS. of both writers were contained in old libraries; and they were translated into nearly every language and turned into verse. In 1272 a monk of Corbie translated "sans rime *L'Estoire de Troiens et de Troie* [de Dares] du Latin en Roumans mot à mot" because the *Roman de Troie* (to be mentioned lower down) was too long. Geoffrey of Waterford put Dares into French prose; and the British Museum possesses three Welsh MS. translations of the same author,—works indeed of a much later period.

We know that the taste for Greek letters was never entirely lost in western Europe. Eginhard tells how Charlemagne understood Greek and how he encouraged the study. Alcuin states, with pardonable pride, that the library at York contained "Græcia vel quidquid transmisit clara Latinis," which may, however, simply refer to Latin translations. Under any circumstances, however, this knowledge must have been confined to a few. It was through Latin that the Middle Ages knew the ancient world, and in that language read the Pseudo-Dares and Dictys, the *Fables* of Æsop, and the *Iliad* of Homer.¹ Through these translations came many of the traces of Greek literature which occur in the fabliaux and romances. How numerous these traces were in the Arthurian cycle will be pointed out. The tale of the Dog of Montargis, familiar to readers of *Miles et Amys* (Carolingian cycle), is derived from Plutarch. Cerberus may be found in the *Chanson d'Antioche*; the story of Tarquin in the *chanson de geste Moniage Guillaume*; the judgment of Paris in *Foules de Candie*; and Cupid and Psyche in the romance of *Partenopeus of Blois*.

For a thousand years the myth of descent from the dispersed heroes of the conquered Trojan race was a sacred literary tradition throughout western Europe, of which a possible survival still remains in the popular phrase which speaks of a generous and courageous fellow as a Trojan. The classical traditions of extensive colonization subsequent to the Trojan War were adopted by Western nations at a very early date. The first Franco-Latin chroniclers considered it a patriotic duty to trace their history to the same origin as that of Rome, as told by the Latin poets of the Augustan era; and in the middle of the 7th century Fredegarius Scholasticus (*Rer. Gall. Script.*, ii. 461) relates how one party of the Trojans settled between the Rhine,

¹ The name of Homer never ceased to be held in honour; but he is invariably placed in company with the Latin poets. Few of those who praised him had read him except in the Latin redaction in 1100 verses which passed under the name of Pindar. It supplied the chief incidents of the *Iliad* with tolerable exactness and was taught in schools.

the Danube, and the sea. In a charter of Dagobert occurs the statement, "ex nobilissimo et antiquo Trojanorum reliquiarum sanguine nati." The fact is repeated by chroniclers and panegyric writers, who also considered the *History of Troy* by Dares to be the first of national books. Succeeding kings imitated their predecessors in giving official sanction to their legendary origin: Charles the Bald, in a charter, uses almost the same words as Dagobert—"ex præclaro et antiquo Trojanorum sanguine nati." In England a similar tradition had been early formulated, as appears from the Pseudo-Nennius (put together between the 7th and 9th centuries) and Geoffrey of Monmouth. Otto Frisingensis (12th century) and other German chroniclers repeat the myth, and the apocryphal hypothesis is echoed in Scandinavian sagas.

In the 11th century the tale of Troy became the theme of Neo-Latin verse. About 1050 a monk named Bernard wrote *De Excidio Trojæ*, and in the middle of the 12th century Simon Chèvre d'Or followed with another poem on the fall of the city and the adventures of Æneas, blending the Homeric and Virgilian records. We now come to a work on the same subject in a modern language, which in its own day and for centuries afterwards exercised an extraordinary influence throughout Europe. Benoît de Sainte-More, the Anglo-Norman trouvère who wrote in verse *Chroniques des Ducs de Normandie*, composed in England, under the eyes of Henry II., about the year 1184 a poem in 30,000 lines entitled *Roman de Troie*. It forms a true Trojan cycle and embraces the entire heroic history of Hellas. The introduction relates the story of the Argonauts, and the last 2680 verses are devoted to the return of the Greek chiefs and the wanderings of Ulysses. With no fear of chronological discrepancy before his eyes, Benoît reproduces the manners of his own times, and builds up a complete museum of the 12th century,—its arts, costumes, manufactures, architecture, arms, and even religious terms. Women are repeatedly introduced in unwarranted situations; they are spectators of all combats. The idea of personal beauty is different from that of the old Greeks; by Benoît good-humour, as well as health and strength, is held to be one of its chief characteristics. The love-pictures are another addition of the modern writer. We find traces of the *Odyssey* of Homer and the trilogy of Æschylus² as well as of Ovid and Virgil. The author speaks enthusiastically of Homer, but his chief source of information was the pseudo-annals of Dictys and Dares, more especially the latter, augmented by his own imagination and the spirit of the age. It is to Benoît alone that the honour of poetic invention is due, and in spite of its obligation for a groundwork to Dictys and Dares we may justly consider the *Roman de Troie* as an original work. From this source subsequent writers drew their notions of Troy, mostly without naming their authority and generally without even knowing his name. This is the *chef d'œuvre* of the pseudo-classical cycle of romances: it shows the most lofty conception, and in it poetical imagination has the freest and most lively play. The *Roman de Troie* was extremely popular. When Benoît, by reason of his lengthiness, failed to please, the Latin version of Guido revived general interest. The story passed through every country of Europe, first in verse and then as a prose fiction, and portions of it furnished matter for the genius of Boccaccio, Chaucer, and Shakespeare.

The first work inspired by the success of the *Roman de Troie* was the *De bello Trojano* of Joseph of Exeter, in six books, a genuine poem of no little merit, written soon after Benoît's work or about the years 1187-88. It was directly

² The Middle Ages had their Latin Oresteia, see *Orestis Tragedia, carmen epicum seculo post Christum natum sexto compositum*, ed. S. Schenkl, Prague, 1867, 8vo.

drawn from the pseudo-annalists, but the influence of Benoît was considerable. Another was the *Troilus* of Albert of Stade (1249), a version of Dares, in verse, brought back to all its severity and affected realism. But these Latin works can only be associated indirectly with Benoît, who had closer imitators in Germany at an early period. Herbot von Fritslar reproduced the French text in his *Lied von Troie* (early 13th century), as did also Konrad von Würtzburg (d. 1287) in his *Buch von Troie* of 40,000 verses. To the like source may be traced a poem of 30,000 verses on the same subject by Wolfram von Eschenbach, still unpublished. The Low Countries were not behind Germany. A dozen *chansons de geste* were translated into Flemish towards the middle of the 13th century; and Jacob von Maerlant, an illustrious poet, reproduced Benoît, and did not omit to acknowledge the authorship. The fame of the romance travelled to the north, and in various forms the Norse or Icelandic *Trojumanna Saga* acquired a distinctly local colour.

In Italy Guido delle Colonne, a Sicilian, commenced in 1270 and finished in 1287 a prose *Historia Trojana*. Although Guido knew some Greek, he did not translate Dictys and Dares, as some MSS. affirm, but reproduced the *Roman de Troie* of Benoît, and so closely as to copy the errors of the latter and to give the name of Peleus to Pelias, Jason's uncle. As the debt was entirely unacknowledged, Benoît at last came to be considered the imitator of Guido. The original is generally abridged, and the vivacity and poetry of the Anglo-Norman *trouvère* disappear in a dry version. The immense popularity of Guido's work is shown by the large number of existing MSS. The French Bibliothèque Nationale possesses eighteen codices of Guido to thirteen of Benoît, while at the British Museum the proportion is ten to two. Guido's *History* was translated into German about 1392 by Hans Mair of Nördlingen. Two Italian translations, by Antonio Cessi (1324) and by Bellebuoni (1333), are still preserved in MS. at Florence. The book passed the seas, and in the 14th and the commencement of the 15th century four versions appeared in England and Scotland. The best known is the *Troy Book* of Lydgate, who had both French and Latin texts before him. An earlier and anonymous rendering exists at Oxford. There is the *Gest Historiale of the Destruction of Troy* (Early Eng. Text Soc., 1869), also an earlier Scottish version by Barbour. The invention of printing gave fresh impetus to the spread of Guido's work. The first book printed in English was a translation by Caxton from the French of Raoul Lefèvre, issued by the foreign press of Caxton about 1474. Lefèvre's own version appeared from the same press about the same time and was the first book printed in the French language. There were also translations into Italian, Spanish, High German, Low Saxon, Dutch, and Danish; Guido had even a Flemish and a Bohemian dress. But not one of these translators even suspected that the writer was only a feeble representative of an old *trouvère*.

Thus far we have only considered works more or less closely imitated from the original. Boccaccio, passing by the earlier tales, took one original incident from Benoît, the love of Troilus and the treachery of Briseida, and composed *Filistrato*, a touching story. This was borrowed by Chaucer about 1360 for his *Boke of Troilus and Cressida*, and also by Shakespeare for his *Troilus and Cressida* (1609). One reason why the Round Table stories of the 12th and 13th centuries had a never-ceasing charm for readers of the two following centuries was that they were constantly being re-edited to suit the changing taste. The *Roman de Troie* experienced the same fate. By the 13th century it was translated into prose and worked up in those enormous compilations, such as the *Mer des His-*

toires, &c., in which the Middle Ages studied antiquity. It reappeared in the religious dramas called *Mysteries*. Jacques Millet, who produced *La Destruction de Troie la Grande* between 1452 and 1454, merely added vulgar realism to the original. Writers of chap-books borrowed the story, which is again found on the stage in Antoine de Montchrestien's tragedy of *Hector* (1603)—a last echo of the influence of Benoît.

Although the *Troie* reveals the greatest power of imagination, Adaptation and was the most influential and important, of these adaptations of ancient classical stories, it was not the earliest of them. It other was preceded by a *Roman d'Eneas*, written, like the *Roman de Troie*, Roman by an Anglo-Norman at the court of Henry II., a contemporary epic. of Giraldus Cambrensis and John of Salisbury. There is, indeed, every reason to believe that the author was Benoît de Sainte-More himself. The work is a tolerably close reproduction of the *Æneid*, some passages being faithfully translated and others elaborated. But the religious character of Virgil's work is wanting, as well as the spirit of Roman greatness shadowed forth in the ancient epic. Long extracts from the *Æneas* have been published by M. Pey (Paris, 1856), but it has not yet been printed in full. Soon after its appearance it was translated with great fidelity into German by Heinrich von Veldeke. The *Roman de Thebes* is an imitation of the *Thebais* of Statius, with the same general characteristics as the *Æneas*. In each case the *trouvère* found a Latin model on which to superimpose an elaborate structure of his own. In each case also the original is abridged, while all polish is effaced, and the pagan marvels replaced by others more familiar to contemporary readers. The change is specially visible in matters of religion. Lydgate translated the *Thebes*, and Chaucer used the romance in his *Canterbury Tales*. It was composed after the *Troie* by another pen than that of Benoît. Lucan's *Pharsalia* was the last of the great Roman epics to be appropriated. *Li Romanz de Julius Cesar* by Jacques de Forez, of which only one MS. exists, dated 1280, is from this source. It adheres to Lucan's text with more fidelity than the other adaptations; but the general intention is changed. While the classic poem ends in the middle of the 10th book, Jacques de Forez conducts Caesar back to Rome. These romances—*Æneas*, *Thebes*, and *J. Cesar*—are mere translations, and are, indeed, our first renderings of Virgil, Statius, and Lucan in modern dialects. But the *trouvères* rearranged and transformed their originals. Fairies, magic, and enchanters, the novel position of women, the sentiments of Christianity, and the spirit of chivalry are strangely at variance with the stories familiar to us in the language of imperial Rome. The influence of new ideas derived from the crusades and the East is plainly visible. Some of the marvels are found in William of Malmesbury, which indicates that they were of popular acceptance.

It is a remarkable fact that, while the *origines* of the pseudo-Second-classical romances are earlier than any of the others, the prose re-compositions are of later construction than almost all those we are produced about to consider. The *Recueil des Histoires de Troyes*, *Hercule*, *tians*, *Jason*, *Oedipus*, *Alexandre*, *Virgilius*, &c., belong to the second half of the 15th century. They have little interest and intrinsic merit, but their immediate originals exercised an extraordinary influence on the literature of the Middle Ages, an influence which appears even in the romances of other cycles and in those composed in prose at an earlier date than those we are now discussing.

Recueil des Histoires de Troyes was "composé par vénérable homme Raoul le Feure prestre chappellain de mon tres redoubté seigneur monseigneur le duc Phelippe de Bourgogne en l'an de grace 1464," but probably printed in 1474 by Caxton or Colard Mansion at Bruges. It is in three books, of which the first deals with the story of Jupiter and Saturn, the origin of the Trojans, the feats of Perseus, and the first achievements of Hercules; the second book is wholly taken up with the "prouesses du fort Herculez"; the third, "traictant de la generale destruction de Troyes qui vint a l'ocasion du ruisement de dame Helaine," is little else than a translation of that portion of Guido delle Colonne which relates to Priam and his sons. Two MSS. of the *Recueil* in the Bibliothèque Nationale wrongly attribute the work to Guillaume Fillastre, a voluminous author, and predecessor of Lefèvre as secretary to the duke. Another codex in the same library, *Histoire ancienne de Thebes et de Troyes*, is partly taken from Orosius. The Bibliothèque Nationale possesses an unpublished *Histoire des Troyens et des Thebains jusqu'à la mort de Turnus, d'après Orose, Ovide et Raoul Lefebvre* (early 16th century), and the British Museum a Latin history of Troy dated 1408.

Hercules.—The end of the first and the whole of the second book of the *Recueil* are reproduced in *Les prouesses et vaillances du preux Hercule* (Paris, 1500), with the addition of a prologue and the genealogy of the champion. The character and adventures of Hercules were of a nature to attract the fancy of a romancist. His labours are represented as having been performed in honour of a Boeotian princess; Pluto is a king dwelling in a dismal castle; the

Fates are duennas watching Proserpine; the entrance to Pluto's castle is watched by the giant Cerberus. Hercules conquers Spain and takes Merida from Geryon. The book is translated into English as *Hercules of Greece* (n.d.). The marquis de Villena took from the same source his prose *Libro de los Trabajos de Hercules* (Zamora, 1498), and Fernandez de Heredia wrote *Trabajos de Hercules* (1682), also in prose. *Le Fatigue d'Ercole* (1475) is a romance in poetic prose by Pietro Bassi, and the *Dodici Travagli di Ercole* (1544), a poem by J. Perillos.

Jason.—*Les faits et prouesses du noble et vaillant chevalier Jason* was composed in the middle of the 15th century by Lefèvre on the basis of Benoît, and presented to Philip of Burgundy, founder of the order of the Toison d'Or. Jason is shown as a foremost figure in tournaments, overthrowing all competitors at one held by the king of Boeotia to celebrate the knighting of his son Hercules. The two become staunch friends and attend the marriage ceremony of Hippodamia. Centaurs interrupt and are exterminated by Jason. He performs other knightly exploits, and on his return is maliciously sent by his uncle Peleus (Pelias) on the Argonautic expedition. The narrative of the journey to Lemnos and Colchos, the love of Medea, and the episode of the Golden Fleece follows the classical traditions. When Jason returns to the country of the Myrmidons, Medea by enchantment restores the old king to youth and brings about the death of Peleus. For this last good deed Medea is banished, with Jason's consent, and is carried off by four dragons. She soars long over Greece before she is able to find her lover; at length she discovers that he is going to wed the princess of Corinth. She descends amid thunder and lightning, kills the two children she bore to Jason, and allows her attendant dragons to destroy with fire Corinth and all its inhabitants. She then inveigles the old Egeus, king of Athens, into marriage, but is banished upon suspicion of attempting to poison her new son-in-law Theseus. Meeting with Jason, who had escaped the burning of Corinth, she becomes reconciled to him, and, abjuring magic, on the death of Eson becomes a good wife and queen. The manners and sentiments of the 15th century are made to harmonize with the classical legends after the fashion of the Italian pre-Raphaelite painters, who equipped Jewish warriors with knightly lance and armour. The story is well told; the digressions are few; and there are many touches of domestic life and natural sympathy. The first edition is believed to have been printed at Bruges in 1474; the type is the same as that used in the first edition of the *Recueil*. Caxton translated the book at the command of the duchess of Burgundy. A Dutch translation appeared at Haarlem in 1495. M. Paulin Paris doubts whether the romance was written by Lefèvre, whose authorship is distinctly asserted by Caxton. Montfaucon refers to a MS. by Guido delle Colonne, *Historia Medee et Jasonis* (unpublished). There is a *Histoire de la Toison d'Or* (1516) by Guillaume Fillastre, written about 1440-50.

Edipus.—A kind of introduction to the *Recueil* is *Le Roman d'Edipus, Fils de Laïus* (n.d.), written in the 15th century by an unknown pen. The story follows the fable told by the Greek poets, adapted, of course, to the taste and habits of later times. The sphinx is drawn as a giant of great subtlety and ferocity.

Histories
of Alex-
ander.

2. The wonders revealed through the Asiatic expedition of Alexander gave rise to a remarkable development of the marvellous in historical composition. The histories of Onesicritus, Aristobulus, and Clitarchus, themselves members of the expedition, were so full of unheard-of things that they soon fell into disrepute. Callisthenes, another companion of Alexander, also wrote an account, which is lost, but his name remains connected with a spurious work in which were crystallized all the fabulous tales of the conqueror. The life of Alexander had every quality to appeal to the imagination. His marvellous career, his genius as a soldier and ruler, the beauty of his person, his early death, were subjects for legend almost in his own day; and a cloud of mythical story soon floated round his memory. Quintus Curtius, who drew from some of these suspicious sources, is a more critical authority, though he allowed rhetorical fancy to embellish his narration. It is a great fall from the Latin historian to the Pseudo-Callisthenes. The work we possess under the latter title represents the second stage of the Alexander myth. Some of the MSS. attribute it to Aristotle, Ptolemy, and Æsop, as well as to Callisthenes,—all with equal verisimilitude. To reconstruct the true from the spurious work is an impossible task after the increased vogue given to the latter by the re-opening of the East to Europe by the Romans, when all the traditions became remoulded in the form they

now possess. Among the histories separate from Pseudo-Callisthenes and subsequent to Quintus Curtius is an *Itinerarium Alexandri*, in Latin, but of Greek origin, which is little else than an amplification of the apocryphal letter of Alexander to Aristotle. It is dedicated to Constantine, son of the emperor Constantine. Similarities between the *Itinerarium* and the Latin version of Pseudo-Callisthenes prove that the stories were current in the 4th century, and may have emanated from the same source; but, while the *Itinerarium* is inferior in authority to Quintus Curtius, it is less a collection of mere fables than is Callisthenes. The Greek text of the latter is supposed to have been written in Alexandria at the commencement of the third century, and to have been translated into Latin by Julius Valerius before 340. The translation was abridged in Latin some time before the 9th century. Much of the work is a running travesty of the true history of the conqueror. The first book deals with his birth and early exploits. The trace of Alexandrian influence is to be found in the pretence that his actual father was Nectanebus, a fugitive king of Egypt. The latter was a great magician, able, by operating upon waxen figures of the armies and ships of his enemies, to obtain complete power over their real actions. He was obliged, however, to fly to Pella, where he established himself as a doctor and was visited by Queen Olympias to get advice upon her continued sterility. He promised that Jupiter Ammon should perform the cure in the shape of a dragon. To make quite sure Nectanebus himself took the place of the animal, and nine months afterwards Philip became the father of the future Alexander. At first there was some unpleasantness, but a reappearance of the dragon convinced everybody that the infant really was the son of a god, so that the putative father could no longer object. Alexander was small and somewhat deformed, but of great courage and intelligence. He was educated under the supervision of Nectanebus, who at last died through a fall into a pit, into which he had been playfully pushed by his royal pupil. The second book continues the various conquests, and the third contains the victory over Porus, the relations with the Brahmans, the letter to Aristotle on the wonders of India, the histories of Candaces and the Amazons, the letter to Olympias on the marvels of Further Asia, and lastly the account of Alexander's death in Babylon.

Callisthenes was translated into Syriac and Armenian in the 5th century. A second Latin abridgment is known as *Historia de Præliis*. The letter from Alexander to Aristotle on the marvels of India, the correspondence between the king and the wise Brahman Dindimus, and *De Gentibus Indiæ*, ascribed to Palladius, are different parts of the same legend. The myth had a wider circulation than any of the others we have yet dealt with, and the East contributed its share as well as the West. Persians and Arabs told the deeds of Iskander; and Firdousi made use of the story in the *Shah-Namah*. Another early Persian poet, Nizami, made the story specially his own. The crusaders brought back fresh developments; Gog and Magog (partly Arab and partly Greek) and some Jewish stories were then added. In the 11th century Simeon Seth, protovestiarus at the Byzantine court, translated the fabulous history from the Persian back into Greek. In the following century was built up the *Geste d'Alexandre* by the successive labours of Lambert le Cort, Alexandre Bernai, Jehan le Nevelais, Gautier de Cambrai, Pierre de Saint-Cloud, Brisebarre, &c. Alexander becomes then a knightly king, surrounded by his twelve paladins. Bernai says that the foundation was Latin (? Valerius or some other Latin version of Pseudo-Callisthenes):

“Un clerc de Casteldun, Lambert li Cors l'escriit,
Qui del Latin le traist, et en Roman le mit.”

The same origin is to be sought for the Alexander myths found in *Renart le Bestourné* and the *Speculum Historiale* of Vincentius Bellovacensis. Quintus Curtius was largely used for the *Alexandreis* (c. 1176-1202) of Gaultier de Châtillon.¹ It was the theme of poetry in all European languages: six or seven German poets dealt with the subject, and it may be read in English, Spanish, Danish, Swedish, Icelandic, Flemish, and Bohemian.

Towards the close of the 15th century an anonymous writer worked up the subject into a prose romance, *L'histoire du noble et vaillant roy Alixandre le Grant* (1506), in which the *Historia de Præliis* is followed with tolerable exactness. After an account of the ancient history of Macedonia and of the intrigue of Nectanebus we are told how Philip dies, and how Alexander subdues Rome and receives tribute from all European nations. He then makes his Persian expedition; the Indian campaign gives occasion to descriptions of all kinds of wonders. The conqueror visits a cannibal kingdom and finds many marvels in the palace of Porus, among them a vine with golden branches, emerald leaves, and fruit of other precious stones. In one country he meets with women, who, after burial in the winter, become alive again in the spring full of youth and beauty. Having reached the ends of the earth and conquered all nations, he aspires to the dominion of the air. He obtains a magic glass cage, yoked with eight griffins, flies through the clouds, and, thanks to enchanters knowing the language of birds, gets information as to their manners and customs, and ultimately receives their submission. The excessive heat of the upper regions compels him to descend, and he next visits the bottom of the sea in a kind of diving-bell. The fish crowd round him and pay homage. Alexander returns to Babylon, is crowned with much pomp, and mass is celebrated. He dies by poison soon afterwards.

The *Vieux du Paon* and *Restor du Paon* are *chansons de geste* attached to the Alexander cycle, to which also belongs *Florimont*, a poem by Aimé de Varennes, said to have been written in 1188. Florimont was a son of the duke of Albania and father of Philip of Macedonia by the heiress of the latter country. This poem gave rise to two prose romances—*La conquête de Grece faite par Philippe de Madrien*, by Perrinet du Pin, first printed in 1527, and *Histoire du roi Florimond* (1528).

3. We now come to the third order of romances included in the cycle of "Rome la Grant," or those which merely reproduce the names of antiquity. The enchanter Virgil is the most famous of those who have given rise to prose works, and what passes under his name is less a romance than a collection of popular tales, many of Eastern derivation. Among romances in verse we have *Eraclès*, *Anseys de Carthage*, *Cléomède*, *Athis et Proflias*, *Protésilas*, and *Ypomédon*. The first part of *Athis et Proflias*, by Alexandre de Bernai (latter part of 12th century), is adapted from the tale of the two merchants in the *Disciplina Clericalis* of Pedro Alfonso, and is the source of Boccaccio's "Tito e Gisippo" (*Decam.*, x. 8). In *Ypomédon*, written by Hue of Rotelande about 1185, most of the characters are named from the *Thebais*. As early as the year 1210 we find a rhymed translation of Ovid's *Metamorphoses* in German by Albrecht von Halberstadt. From Ovid is taken the story of Pyramus and Thisbe in Chaucer's *Legend of Good Women*, which is the subject of a prose work in Italian, *Piramo e Tisbe* (Milan, s.a.). The episode of Orpheus and Eurydice furnished the plot of the poetical *Histoire d'Orphée* of Guillaume de Machault (d. 1370) and the English *Sir Orpheus*. The tale of Theseus was handled by Boccaccio and supplied the title and names to the prose romance *Histoire du chevalier Theseus de*

Coulogne (1534). The Bible as well as the classics was laid under contribution. Gaultier de Belleperche wrote a metrical *Roman de Judas Machabée* about the year 1240, of which a prose reproduction is *Les chroniques du prince Judas Machabée*, l'un des neufs preux, et aussi de ses quatre frères (Paris, 1514).

The Enchanter Virgil.—After turning the heroes of antiquity The into knights-errant, it was a simple task to transform ancient poets chanter and philosophers into necromancers; and Virgil and Aristotle became popularly famous, not for poetry and science, but for their supposed knowledge of the black art. One of the earliest references to the magical skill of Virgil² occurs in a letter of the chancellor Conrad (1194), reproduced by Arnold of Lübeck in the continuation of the *Chronicon Slavorum* of Helmold. John of Salisbury alludes to the brazen fly fabricated by Virgil; Hélinand (d. 1227) speaks of similar marvels in a work from which Vincentius Bellovacensis has borrowed; and Gervase of Tilbury, in his *Otia Imperialia* (1212), and Alexander Neckham (d. 1217), in *De Natura Rerum*, have reproduced these traditions, with additions. German and French poets did not overlook this accessory to their repertoire. The *Roman de Cléomède* of Adenez (12th century) and the *Image du Monde*, an encyclopædic poem of Gauthier de Metz (13th century), contain numerous references to the prodigies of the enchanter. Reynard the Fox informs King Lion that he had from the wise Virgil a quantity of valuable receipts. He also plays a considerable part in the popular folk-tale *The Seven Wise Masters*, and appears in the *Gesta Romanorum* and that curious guide-book for pilgrims, the *Mirabilia Romæ*. He is to be found in Gower's *Confessio Amantis* and in Lydgate's *Bochas*. A Spanish romance, *Vergilios*, is included by E. de Ochoa in his *Tesoro* (Paris, 1838), and Juan Ruiz, archpriest of Hita (d. 1351), has also written a poem on the subject. Many of the tales of magic throughout Europe were referred to Virgil, and gradually developed into a completely new life, strangely different from that of the real hero. They were collected in French under the title of *Les Faits Merveilleux de Virgille* (c. 1499), a quarto chapbook of ten pages, which became extremely popular, and was printed, with more or less additional matter, in all languages. We are told how Virgil beguiled the devil at a very early age, in the same fashion as the fisherman used the jinn in the *Arabian Nights* when he got him to re-enter Solomon's casket. Another reproduction of a widely spread tale was that of the lady who kept Virgil suspended in a basket. To revenge the affront the magician extinguished all the fires in the city, and no one could rekindle them without subjecting the lady to an ordeal highly offensive to her modesty. Virgil made for the emperor a castle in which he could see and hear everything done or said in Rome, an ever-blooming orchard, statues to preserve the safety of the city, and a lamp to supply light to it. He abducted the soldan's daughter, and built for her the city of Naples upon a secure foundation of eggs. At last, having performed many extraordinary things, he knew that his time was come. In order to escape the common lot he placed all his treasures in a castle defended by images unceasingly wielding iron flails, and directed his confidential servant to hew him in pieces, which he was to salt and place in a barrel in the cellar, under which a lamp was to be kept burning. The servant was assured that after seven days his master would revive a young man. The directions were carried out; but the emperor, missing his medicine-man, forced the servant to divulge the secret and to quiet the whirling flails. The emperor and his retinue entered the castle and at last found the mangled corpse. In his wrath he slew the servant, whereupon a little naked child ran thrice round the barrel, crying, "Cursed be the hour that ye ever came here," and vanished.

Literature.—On the subject generally, see A. Chassang, *Histoire du roman dans l'antiquité*, 1862; P. Paris, *Les MSS. Français de la Bibl. du Roi*, Paris, 1835-48, 7 vols.; H. L. D. Ward, *Cat. of Romances in the Dep. of MSS.*, British Museum, 1883; E. Du Ménil, *Preface to Flore et Blancheflor*, 1866; Egger, *Hélienisme en France*, 1869. The Troy legend is dealt with in the elaborate work of A. Joly, *Benoit de Sainte-More et le Roman de Troie*, 1870-71, 2 vols.; G. Körting, *Der altfranz. Roman de Troie*, 1883; F. Settegast, *Benoit de Ste-More*, Breslau, 1876; Frommann, *Herbert v. Fritzel u. Benoit de Ste-More*, Stuttgart, 1857; R. Jackel, *Dares Phrygius u. Benoit de Ste-More*, Breslau, 1875; E. II.—MEDIEVAL ROMANCE.

(a) Arthurian Cycle.

Origines. The oldest and certainly the most important of the cycles of mediæval romance is that which passes under the name of King Arthur, or of the Round Table. The names, characters, and actions of its heroes have permeated modern literature throughout Europe; yet so little do we know concerning the *origines* and the first authors of the tales which form the body of Arthurian romance that there are few subjects in literary history more obscure and undefined. It can only be said with assurance that from about the year 1150 several poems¹ were composed by minstrels (a class of men recruited from all ranks of society) upon incidents and personages familiar to readers of what is called the *Morte Arthur*, a compilation of the second half of the 13th century. The *Morte Arthur* was not originally so called, and it was not a direct compilation from the ballads of the 12th century, but seems rather to have been a mere unskilful reduction into a single *corpus* of some five or six prose romances which had already grown out of the poems, and each of which professed to relate the adventures of nearly the same set of heroes. The first appearance of these stories in prose compositions is here our chief concern; and it is, unfortunately, likewise our chief difficulty. The sources of information upon the subject are defective and vitiated to a singular degree; and the light thrown by the investigations of recent writers is frequently of the nature of cross-lights. The following attempt at constructing a brief literary history of the Arthurian romances is not offered as a complete analysis of the work which has been done, but as a summary of facts and probabilities.

The Roman conquests in Spain, Gaul, and Britain imposed upon a large portion of the conquered peoples the necessity of using the Latin language, which thereby became, and for centuries remained, the medium of educated intercourse and the language of the towns and the centres of government in those countries. In common speech, naturally, it became depraved in course of time, and the pure *lingua Latina* of the high officials and the clergy existed side by side with the corrupt *lingua Romana* of the Romanized people. The latter was, however, ignored by polite literature, and probably never appeared in a written form till it was used for political purposes on the occasion of the celebrated partition of Charlemagne's empire among his grandsons. We may say that the literature of romance begins with popular poetry of the 10th or 11th century; but, as its subject-matter was derived to some extent from the more respectable *lingua Latina*, we must go back a few centuries earlier to find the *origines*. When the people of Rome became acquainted with the civilization and literature of Greece they framed a fabulous history to connect themselves with the superior race,

and the *Æneid* exhibits that pseudo-tradition in its most permanent and powerful embodiment. A similar desire affected the Romanized Britons, and we may confidently assume that before the end of the 3d century a poetical form had been given to the story of the Trojan Brutus who founded the kingdom of Britain, blended with something of the real traditions of the Celtic race. No such form survives at present, but we may discern its traces and results in Nennius (sec. viii.-x.), Geoffrey of Monmouth (d. 1154), and in all the subsequent chronicles.

In the 11th century the Anglo-Saxons of England had their old Germanic stories of Beowulf, Sigfrid, and the Nibelungen; the Britons of the west enjoyed their Celtic and Britanno-Celtic myths; the Saxonized Britons of Wiltshire and elsewhere combined the legends of both the others; and the best educated men amongst the clergy had an acquaintance with Virgil, Ovid, and Statius. Here was a rich material for the imagination, and the invasion of the Normans brought a fructifying element. In France, Roman, Franco-German, Celto-Breton, and Scandinavian traditions were already intermingled; and the reintroduction into Saxonized England, from the south, of Celtic myths nearly identical with those which the Anglo-Normans found in Wales before the end of the 11th century gave to the latter a fresh life and a distinct predominance over all the other traditions of the composite people. Hence arose the British cycle of romance, accepted partly as history, partly as fiction by the new people of Norman England. Bretons, Britons, Normans and French, the Saxonized Britons, the Franco-Gallicized Scandinavians, and the Dano-Saxons all found a common basis of amalgamation, and it is no mere metaphor to say that the publication of Geoffrey of Monmouth's fabulous chronicle formed a momentous era in the history of England.

When the Saxons entered Britain in the 5th century they found in the middle and the south a Romanized kingdom ruled by a monarch with a British or Cymric name. The vernacular tongue of Britain was then and for centuries afterwards much nearer in form to the Gaelic of Ireland and of western and northern Scotland, the Pictish of Scotland, and the Gaulish of France than the Cymric of Wales is now or was then. It was a long time before the Saxon conquests extended so far as to leave the Cymry or Welsh the sole distinct people of the original inhabitants of the country. In the meantime there had been conflicts with the Pictish kings of the north, the Gaelic or Cambro-Gaelic kings of Strathclyde, and the princes of North and South Wales. Amongst their opposers the most successful and the most memorable was a prince or chief of Strathclyde, who is called by Nennius "Arthur dux bellorum," by the English "King Arthur," by the Welsh "the Emperor Arthur." After the departure of the Romans there were several independent monarchies or principalities in the island—that of the Romanized Britons occupying the centre, south, and south-east of the country; two Cymric principalities in Wales (North and South); the Cambro-Gaelic kingdom of Strathclyde, extending from the Clyde to Chester; the unmixed Gaels in the north-west of Scotland; the Pictish kingdom in the north-east; and a Scandinavian population between the Firth of Forth and Norwich. It is now settled by scholars that the Pictish speech was a dialect, like Gallic, Gaelic, and Cymric, of the common Celtic language; and in the early centuries of the Christian era the radical unity of all these tongues had not yet been effaced by the action of local varieties of pronunciation and arbitrary rules of orthography; consequently there was no such sentiment of national or racial distinction between the divisions of the Celtic race as is nowadays produced by political frontiers. The real Arthur, whoever he was, has been claimed by the

¹ *Chansons de geste*, or ballads of knightly adventure, produced by wandering minstrels called in northern France and England *trouvères*, in southern France, Spain, and northern Italy *troubadours* (troubadours), in Germany *minnesänger*, and intended for recitation with more or less musical accompaniment.

Welsh as their own man, a champion of the beaten Celts retiring westward to the mountain-fastnesses before the victorious Saxons. They have lost sight of the fact that there were always Cymry in Wales, who must have regarded their brothers in Loegria (England) much in the same way as they did those of Strathclyde, namely, as kinsmen and allies sometimes, as fair game for attack and plunder more frequently. The struggle between the Celtic and Germanic race was a long one, and it can only have been after the power of the Romanized Britons of Loegria and of the men of Strathclyde was broken, in the battles to which we may attach the name of Arthur, that the tide of war reached Wales along with the British fugitives who crowded thither and to Brittany; hence the appearance of Roman names among the British warriors. It may be surmised that Arthur is not a name but a title given to a Strathclyde warrior, corresponding to the Latin *imperator*.¹

The traces of Roman occupation and of Roman culture were not wholly effaced for many centuries in the west of England, and, besides the Latin quasi-historical writings attributed to Gildas and Nennius, there must have been something like a British Livy and a British Virgil in existence between the time of Constantine and that of the pseudo-classical compositions of Geoffrey of Monmouth and Joseph of Exeter. It is quite certain that the work we call by the name of Nennius did not furnish all the subject-matter of Geoffrey's *Historia*, and the mysterious old volume which his friend William of Wallingford brought to him from Brittany about 1130 must have contained poetic legends as well as prose pseudo-history. Another mysterious volume is the "Latin book" in the monastery at Salisbury, to which the romancists of 1160-1220 professed to have resorted for their narratives. In Geoffrey's *Historia*, compiled, as he says, from William of Wallingford's book, we find three elements blended—(1) the epic of Brutus (which must have been written in Britain before 300); (2) a record of British kings down to the Saxon invasion (probably a corrupt version of the same real history that appears distorted and truncated in Nennius); (3) the lives of Arthur, Guenhumara, and Merlin (old British popular legends, wrought into union with a later Cymric tradition in which the British or Gadelic Arth-vaur, Art-vor, or Ard-tur had been converted into a Welsh king Arthur).

The Round Table romances had their starting-point in Geoffrey's *Historia*, first published in 1138-39, revised and republished in its present form in 1147.² Yet there is no mention in Geoffrey of Lancelot and Tristan, two heroes of much greater importance in the romances than Arthur himself. It does not seem to have been observed before that there is a curious set of resemblances between the personages of the romances and those of the Homeric siege of Troy. The names of Arthur and Uter suggest Atrides (Menelaus and Agamemnon rolled into one); Mark, again, is Menelaus; Guenhumara and Yseult are

like Helen, Guenhumara also resembling Chryseis and Briseis; Lancelot and Tristan are like Achilles and Paris. Lancelot becomes for a time the enemy of his king (Arthur=Atrides) and stands aloof from him; he is unsuccessful in his quest of the Grail, as Achilles dies before Troy is taken; his son Galaad, like the Achilleid Neoptolemus, achieves the father's unfinished task. Lancelot (*lanc-e-loc*=child of the lake) is brought up in concealment by the Lady of the Lake, just as Thetis (the goddess of the sea) brings up her son Achilles, disguised as a girl, in obscurity. Chiron, to whose care the young Achilles is at first entrusted by Thetis, resembles Merlin, the friend or lover of the Lady of the Lake, in his half divine, half human nature.³ Again, not only does Galaad by his name remind us of the hero of the *Achilleidos* (it must have been as usual to give this genitive name to the poem of Statius as that of *Eneydos* to Virgil's), but there are other curious similitudes. The name of King Perles or Pelles, by whose daughter Lancelot becomes the father of Galaad, is suggestive of, or may have been suggested by, the Græco-Latin appellation of Achilles, Pelides son of Peleus. One of the meanings that has been suggested for the name of Lancelot is *l'ancelot*=the serving man, in reference to one of the incidents of his story. Although a different origin is hinted at above, it would not be inappropriate to designate Achilles in his female disguise at Delos *l'ancillet* (=the male damsel, in attendance on Deidamia). As in the old Greek poems we have Atrides and Pelides contesting for Briseis, and the minor Atrides, Menelaus, similarly contending with Paris the ravisher of Helen, so in the romances we find Guenhumara the object of mutual strife between her lover Lancelot and her husband Arthur, son of Uter Pendragon, and Yseult the cause of war between King Mark and Tristan. Again, a resemblance is to be found in the incidents of fabulous birth between Arthur and Hercules, Arthur and Alexander the Great.

These observations are not intended to contradict the claims of the Cymric people to have furnished the romances with much of their material; for it would be difficult to resist the evidence of such names as Tristan and Yseult, which indicate sufficiently their British or Breton origin, and even Lancelot might have been, as first suggested above, a Welsh or British translation of an epithet which would apply to Achilles in connexion with the following words from Statius.⁴ Thetis says (as the Lady of the Lake might have said of Lancelot)—

"Sæpe ipsa (nefas!) sub inania natum
Tartara et ad Stygios iterum fero mergere fontes;"

while her son's guardian, Chiron, is named in the same place "Carpathius vates," which at once reminds us of the "Caledonius vates" (Merlin) of Geoffrey of Monmouth. At the same time the name of Guenhumara (Guinevere) makes one think of Thetis, the white-footed lady of the sea. As the name Guenhumara certainly preceded in date all the Anglo-French romances and is undoubtedly an old one, we may as well say at once that the intention is here to suggest an hypothesis that Britain produced Latin poets during the time of the Roman occupation, who wrote works not only on the fable of a British descent from the Trojans through Brutus, a fabled kinsman of Æneas, but also on the various subjects of classic mythology, the stories of Thebes, Troy, the Golden Fleece, and Alexander.⁵ This

¹ The name Arthur is found for the first time in Nennius (where the hero is said not to be a king but only *dux bellorum*). He explains it as meaning either the "dreadful bear" or the "iron hammer." Now, although the former may refer equally well to Cymric and to Gaelic, i.e., *arth-vaur* or *art-vor*, the alternative sense is better sought in Gaelic, *ord*, a hammer, being a known word in that language, while there is no trace of it in Cymric. The second syllable of *ord-dur* is common to both languages, equivalent to the Latin *durus*, and has assumed in Welsh the meaning of "steel." It probably also meant "iron." This observation shows that Nennius did not know whether the name was a Gaelic or a Cymric one, and the mere uncertainty is in itself an argument that Arthur was distinctly not Cambrian. If it were permissible to seek a purely Gaelic etymology for Arthur we should find it in *ard-tur*=*altus dux*, high chief or generalissimo. In the two early authorities Gildas and Bede the British champion of the 5th century is named Ambrosius Aurelius, a man of Roman family.

² His poem on the *Life and Prophecies of Merlin* was a separate work, published in 1136-37 and again in 1149.

³ The names of several beings of this mixed nature in the early romances begin with the same word, *mer*, *merhl*, or *mel*, as *Merlin*, *Melusine*, *Melior*, *Melion*.

⁴ Hugh of Rutland's poem of *Ipomedon* (written in 1185) evinces by the names of its personages such an acquaintance with the *Thebais* of Statius as the maker of the *Lancelot* seems to have had with the *Achilleis* of the same poet. He usually calls his King Arthur *Atreus*.

⁵ Yguerne, the name of Arthur's mother, was perhaps akin in its original British sense (although in Cymric it means "the true" or "the

hypothesis, which requires to be associated with the corollary that British translations or adaptations were formed when the Roman influence began to wane, would account for the curious circumstance that some of the Greek and Oriental fictions are found in Anglo-Saxon versions of much greater antiquity than any that have survived in the other vernaculars of Europe. Direct transference of such works from classical codices can hardly be presumed to have been the custom of a rough and semi-barbarous nation of Teutonic invaders; the medium must have been the existence of Brito-Latin and British poems among the conquered people.

The success of Geoffrey of Monmouth's *Historia* and of his *Merlin* brought indignant comment from some of the Anglo-Norman historians, but it inflamed the minds of other writers already excited by the extraordinary events of the period. The result was the genesis of modern fiction. Within a few years after Geoffrey's publication the Norman Wace translated the *Historia Britonum* into French verse (1155), making some additions; and in his work entitled *Roman de Brut* we find the words—

"King Ertur made the Round Table
Of which Bretons tell many a fable"—

from which we may infer that the Round Table stories, which led to the construction of the French romances, were derived directly from Brittany, just as Geoffrey declares his *Historia* to have been. Wace, as a Jersey man, could have made no confusion between the Waleis of Cambria and the Bretun of Armorica.

Recapitulating what has been already said, we may chronologically tabulate the first elements of Arthurian story thus—I. *Arthur*, *Guinevere*, *Merlin* (in Geoffrey), 1136-49; II. the *Round Table* (as shown by Wace), before 1155; III. *Lancelot*; IV. the *Grail*; and V. *Tristan*.

Gast's
Tristan
and
Map's
Lancelot.

The original *Tristan* was earlier than the *Lancelot*, and was presumably a French poem (or prose work?), written about 1160 by Luc de Gast, a trouvère of English birth who lived near Salisbury, and is said to have had access to the book of stories referred to in a previous paragraph. The poem (?) and the book have perished, and the *Tristan* story was written under the name of *Le Bret* (= the Breton), to distinguish it from *Le Brut* (= the Briton) of Wace, at a later date, with so much additional matter that it must be placed after the *Lancelot*. Walter MAP (q.v.) of Hereford, who died archdeacon of Oxford in the year 1210, was a man of Welsh origin or kindred. In 1185 Hue de Rotelande of Credenhill near Hereford wrote a French romantic poem, in which the names of the characters are all derived from the *Thebais* of Statius, but the incidents are wholly imaginative or derived from other sources. In it he speaks, in deprecation of any blame for his falsification of the truth of history, of Walter Map as being quite as great a romancer as himself. In connexion with statements frequently repeated in the early MSS. of the romances, this remark suffices to prove that before 1185 Walter Map had already published his *Lancelot*. We may fairly put the date before 1175, say about 1170; and it would be probably correct to assume that the *Lancelot* was a French poem (or prose work?) composed while the author was still young (1165-70). It has perished, like Luc de Gast's *Tristan*, and we can only conjecture that it had some similar connexion with the *Achilles* of Statius to that of Hue de Rotelande's poem with the *Thebais*. It was, however, reduced to or rewritten in prose and amplified before 1200 in the form in which we now find it in several old MSS. (none earlier than the 13th century). It is certain that Rustighello or Rusticien of Pisa was employed about

faithful") to "Alcmena," and may have meant "manly," "robust." Arthur proves his fitness for kingship by the performance of wonderful feats like the labours of Hercules.

1270-75 to unify or harmonize in a single compilation the scattered Arthurian romances, and it is considered probable that the result was the French prose original of the existing *Morte Arthur*. But it is also certain that there exist prose Arthurian romances in MSS. at least as old as 1270, and that they were copies of yet older ones. Rusticien's work must have been simply one of compression and combination. We know from the MSS. of two different prose translations of a totally different romantic chronicle (the Pseudo-Turpin's *Chronicle of Charlemagne*), written in and about 1200, that metrical narrative was losing credit and that French prose composition had already set in. This statement, which refers to the French kingdom, is likely to be yet more applicable to England, where metrical success would naturally be more difficult to achieve than in the true home of French speech. As prose was current in France before 1200, it is not rash to assume that it had an earlier and less limited currency in England. Reckoning thus we may assume that the *Lancelot* and the *Tristan* were written in prose before 1190.

The Round Table and the Grail are so closely connected that it is difficult to regard them as having had each a separate origin. The mention of the former by Wace and proves the existence of stories of a Round Table current before 1155. The Round Table as it appears in the current texts of the romances is simply an important portion of the furniture of the narratives: it does not represent a cycle of incidents or even a number of special episodes. One might suppose from the form of Wace's phrase that the word was with him, as it is now, a general epithet to designate Arthurian stories, rather than merely the name of a material object, as it is in the romances. But we cannot assume the fact for lack of specific information. The first and also the chief instance which we have of the appearance of the Round Table (beyond Wace's allusion) is in the existing *Lancelot*, which we may refer to about 1190. In the epilogue of the *Tristan*, Hélie de Borron speaks of Luc de Gast's original work on that hero as the first of "les grans livres de la tauble roonde." There is no reason to imagine that this phrase was written after the year 1200; and it indicates sufficiently that several books were collectively styled "Romances of the Round Table" between 1155 and the end of the century. One of these books was *Joseph of Arimathea, or the History of the Holy Graal*, written about 1170-80 by Robert de Borron or Robert of Bouron, a trouvère born near Meaux. This narrative seems to have taken at least two forms before it was incorporated in the prose *Lancelot*, and the alterations were so numerous and important that some writers consider the *Grand Graal* to have been a rewriting effected in collaboration by Walter Map and Robert de Borron. The earlier portion of the *History of the Graal* was but lightly treated on its incorporation in the *Lancelot*, and the form in which we have it in the separate romance of the *Graal* is of more modern compilation. The later portion of the Grail story—namely, the *Queste du Graal*, which was utilized by Map (or his recomplier) in the *Lancelot*—differs from that of the French writer in making Galaad the achiever, while Perceval was the hero of the quest in Robert de Borron's work and its recom compilations, as well as in the separate prose romance of *Perceval* and the separate *Histoire du Graal*. We may conclude that the older works (the original *Lancelot*, *Merlin*, and *Tristan*) had nothing of the Grail in them, and that the publication in French of the *Tristan* by Luc de Gast and the *Lancelot* by Walter Map (produced in this succession between 1160 and 1180) were accidentally contemporaneous with Robert de Borron's poem (or prose work) on the grail (= chalice) or cup of Christ's passion and the table of the Last Supper, based upon an old legend (connected in some way with the

ancient popular *Gospel of Nicodemus*), according to which Joseph of Arimathea brought Christianity to Britain in the time of Vespasian. Then Robert de Borron continued his story in another work which represented the quest or re-discovery of the Grail in Avalon, Brittany, or Britain, by Perceval, the grand-nephew of Joseph of Arimathea; and Walter Map appropriated so much of De Borron's *Histoire* and *Queste* as suited him, working it up in a continuation of his story on Arthur, Guinevere, and Lancelot, whilst adding to and altering the incidents of the narrative very considerably. Finally, Hélie de Borron (about 1190) re-wrote the *Tristan* in something like its existent form, weaving it by enlargement into connexion with the other tales, and probably soon after 1200 united for the first time in one enormous and unharmonized corpus the full set of Arthurian stories. One reason why we cannot assign this first combination to a later date (as those do who hold the work of Rusticien de Pisa to have been something more than a mere compression) is that the *Guiron*, written by Hélie de Borron (probably soon after 1200), is not incorporated in the *Morte Arthur*, which it would assuredly have been if Rusticien (about 1270-75) had been employed to unite a number of detached stories rather than to re-edit an already existing compilation. Of Hélie de Borron we only know that he was a relative of Robert; that he was the virtual author of the *Bret* or *Tristan*, in which he incorporated the substance of tales written by Luc de Gast and Gasse li Blont; that he also wrote *Palamedes* in two parts (*Meliadus* and *Guiron le Courtois*); and that his work was done at the request of a king of England, alleged to have been Henry II. or Henry III. Of the other early writers of Arthurian stories the chief were the trouvère Chrestien de Troyes (about 1180-90), who composed a poem upon an episode of Map's Lancelot story, and another upon the *Perceval* (in which he may have combined Robert de Borron and Map), and Guyot de Provins (about 1190-95), who wrote a romance of *Perceval*, now lost, and only known through the German translation of Wolfram von Eschenbach (about 1205). As for the Welsh stories in the *Mabinogion* and the Welsh *Seint Greal*, there is really no evidence to show their anteriority to the English *Morte Arthur*, except the fact that two of the tales (*Geraint* and the *Lady of the Fountain*) are of similar substance to the poems of Chrestien de Troyes, *Erec et Enide* and *Le Chevalier au Lyon*,—narratives of Arthurian personages but not embodied in the French prose romances. Even the Welsh chronicles which are supposed to have furnished the original text of Geoffrey of Monmouth's *Historia* have been ascertained to be merely translations from the Latin version. It is a safe conclusion to say that anything in Welsh literature corresponding with portions or incidents of the French romances was simply a translation made in the 13th or 14th century from a French original. This refers, of course, to what is now extant, for there can be little question that Breton and Cymric legend furnished the earlier romancists with names and legends in plenty. Returning to the consideration of names, it is obvious that when Lancelot dy Lak appears in Welsh it is simply a corruption of the Franco-English Lancelot, and that the Cymric writer had no idea of its above-suggested origin in a British *lanc-e-loc* (a conjecture which is fortified by the pleonasm of *du-lak* or *del-lak*) or in a French *l'ancillet*. Consequently the original Lancelot story has left no trace in purely Welsh literature. With Perceval we may think differently; the Welsh name Peredur, under which he is known, is a sufficient warrant for supposing that portions of the Welsh tale are at least as ancient as Walter Map. The very form Peredur, like that of Arth-ur, is archaic, and with the latter it requires a different interpretation from that which Welsh scholars

have given it. Here it may be observed that the terminal *ur*, whatever may have been its true sense, is remarkable for its frequent use in the names of Pictish princes. As for Perceval, wherever Robert de Borron got the name (see below), Walter Map, in adopting it for the hero of the story that belongs to Peredur, made the two names thenceforward identical.

Analysis of the Arthurian Romances.

I. II. *Arthur and the Round Table* had no separate romance, or else it has perished. It exists now substantially as part of *Lancelot* (III.).

I. *Merlin*.—Most of his story appears in Geoffrey of Monmouth and in Wace, from whom it was probably worked up into a French poem (or prose work) by Robert de Borron about 1160-70. The French prose composition, embracing his life and, as an appendix, his prophecies (Latin by Geoffrey), was apparently written about 1200 (by Hélie de Borron) in the form in which it exists in certain MSS., and nearly as it appears in printed books. Merlin, the son of an incubus, rescued at his birth by sudden baptism from the malignant destiny for which his diabolical parent had begotten him, is always described as a magician. He is called by the Welsh Myrddin, a form which betrays the posteriority of the existing Cambrian legends not only to the date of Geoffrey but also to the French romances; in one of the earliest incidents of his story, however, he himself gives his name as Ambrosius.¹ He is represented as living apparently at the time of the Saxon invasion of England. He was not a friend of Vortigern; this king, whom we know from English sources to have been attached more to the Saxons than to his countrymen, was represented in the old Merlin story as a usurper reigning in an interval between Moines, son of Constans, and the two brothers of Moines, Uter and Pendragon. After the successive deaths of Vortigern and Pendragon (on whose fall Uter adds his brother's name to his own) Merlin continues to be the friend and counsellor of King Uter Pendragon. In that capacity he helps the king to assume the shape of Gorlais, duke of Tintagel, and thereby to beget Arthur upon the Duchess Yguerne. (The name Pendragon and the action remind us of the fabulous birth of Alexander the Great; the name Uter, in connexion with the go-between Merlin, and the probable Celtic meaning of Yguerne remind us of Jupiter, Mercury, and Alcmena.) The result is the birth of a hero who resembles both Hercules and Alexander. He grows up and is held to be merely the son of Gorlais, in spite of the fact that he was born after Yguerne (already a widow) had married Uter Pendragon; but he proves his right to royal place after the king's death by performing some extraordinary feats. In these he has Merlin's aid, as well as in the conduct of his subsequent wars with the Gauls and the Saxons. Merlin has a lover or mistress in Viviane, the Lady of the Lake, to whom in an unlucky moment (as Samson to Delilah) he betrays a certain spell. She uses it to try her power, without having learned the converse charm, and poor Merlin vanishes into the midst of a thornbush, whence his voice can be heard; but he is seen no more. Here the romance ends,—one of the most interesting, as well as one of the best-constructed and most simply told of the Arthurian series. The name and deeds of the enchanter have found their way into most modern literatures. One of Merlin's actions was to institute a round table at Carduel, at which room was made for King Arthur and fifty of his nobles, with a vacant place for the Holy Grail. This was a ceremony to be performed once every year, and it was on the first of these occasions that Gorlais brought his wife Yguerne with him to court, and that King Arthur fell in love with her (as David with Bathsheba). This circumstance, although of later date than the original Merlin, leads us to the next romance in the cycle.

IV. 1. *The Holy Grail*.—The Grail romance began with Borron's Holy poem (or prose narrative) on Joseph of Arimathea. An old tradition maintained that Joseph of Arimathea (confounded in some respects with the centurion at the crucifixion and with Josephus the historian) brought the gospel to Britain or to Gaul in the first century of our era. The French romance on this subject, whichever of its existent early forms in verse and prose was the earlier, relates the story thus:—Pilate allowed Joseph to take down the body of Christ from the cross, and gave Him also *son vaisseul*, by which was evidently meant the chalice of His passion, or the cup used at the Last Supper. Of all the numerous interpretations suggested for the word "grail" or "grail" the only tenable one is that of "cup," which plainly refers to the words "son vaisseul." In that cup Joseph collected the precious blood of his Saviour. He loses it when put in prison by the Jews, but it is restored to him in

¹ When we remember that the Ambrosius Aurelius of Gildas was probably the Arthur of Nennius and the romances, and that Merlin was called Ambrosius Merlinus, we are drawn to believe in the Romano-Briton origin of the stories, and to conclude that "Arthur" and "Merlin" are two explicative or distinguishing epithets attached to the older names.

infringed a vow, and the labour is achieved by one even purer than himself among the Round Table heroes, namely, Galaad, the son of Lancelot. All this is of Map's own invention, and much of it must have been posterior to Chrestien's poem, in which (although based partly on Map and partly on Robert de Borron) Perceval remained the achiever of the quest.¹ The Borronesque view of Perceval as one of a line of successive Grail-custodians or Grail-kings impressed the imagination of Guyot de Provins, and led him to regard with contempt the pleasant episodes of Perceval's youth as told by Chrestien. In Wolfram von Eschenbach's poem there is a long succession of Grail-kings, beginning with Titurël, and ending with Partzifal (Perceval)²; the scene of their rule is shifted to Anjou and Spain; the story is said to draw its origin from a book found at Toledo; several Moorish and Catalan names are found in it; and finally the Grail-kings and their people are confounded with the Templars, struggling against the heathens. The romance of *Perceval le Gallois*, such as we have it since its first appearance in print in 1530, is a prose compilation derived from the poem begun by Chrestien de Troyes about 1180 and finished by Manessier about 1230.

Lancelot. III. *Lancelot*.—This hero, like Perceval, has furnished an addition to European nomenclature. In this romance, which there is so much evidence for ascribing to the celebrated Walter Map (see above), the substance of Geoffrey's Arthur, Guinevere, and Merlin was used as the introduction to a powerful fiction in which a new hero, Lancelot of the Lake, carries on an adulterous amour with Queen Guinevere, while at the same time he reveres and loves King Arthur and performs deeds of heroic daring under the influence of the most generous feelings. The tale, although lengthy and overlaid with a crowd of adventures which have no bearing on the direct development of the plot, and notwithstanding the unpleasant nature of the chief subject, is one of extraordinary interest. The character of Lancelot remains unaltered throughout the course of the story, and is drawn with a masterly hand. Although his love is criminal, and he frequently does pious penance for his sins, yet his utter self-sacrificing devotion to the queen weakens by its exquisite fidelity the reader's sense of his treachery towards the king, whom he never ceases to regard with a feeling of the deepest affection and reverence. His faults are such that he recognizes his own incompetence to become the achiever of the quest; but he begets, upon Elaine, the daughter of King Pelles, a son Galaad, to whom the glory of winning the Grail and redeeming his father's sins is reserved. Even here the romancer takes care to show that he was not untrue to Guinevere, his senses having been deceived by a spell (used by Elaine's maid to gratify her mistress's longing), which makes him imagine that his bedfellow is the queen. Nemesis begins to work when, upon a second use of the spell, Guinevere, after having waited for him in vain, finds him in the arms of King Pelles's daughter. She reproaches him bitterly and drives him from her presence with such cruel words that he becomes insane and wanders about the woods and fields like Nebuchadnezzar. Some years elapse before he is recognized by Elaine, when chance takes him to the castle of Corbin, in which King Pelles has custody of the Grail. She cures him by means of the sacred vessel; but it is not long before he quits her again and finds his way to Camelot. Arthur and the queen and his fellow-knights are rejoiced to see the lost Lancelot again, and the usual round of tournaments begins. We now come to the episode of Galaad. On the eve of Pentecost an old man dressed in white brings a youth to Arthur's court. When all the knights are assembled at the ensuing banquet every seat is filled save that which was always left vacant for the Holy Grail, so that there is no place for young Galaad. Certain wondrous signs are pointed out by the old man which indicate that the "seat perilous" is meant to be filled by the young hero, who at once accomplishes another test which has foiled Gawain and Perceval. The Grail appears, and light and perfume fill the hall; it passes away again, and the next day the knights depart upon the quest of the holy vessel, Arthur giving way to a pathetic regret that his merry company of Round Table champions is to be broken up for ever. Galaad, the pure knight, is the only one who succeeds, and becomes king of the Holy City; then Joseph of Arimathea appears, and Galaad dies, his task accomplished. Gawain and Bors fail; Lancelot and Perceval nearly succeed, but are foiled. Bors brings back an account of Perceval's death, and Lancelot returns to court, a moody man; he and Guinevere fall back into the old sin. The queen is accused of having poisoned a knight, and is exposed to the usual ordeal. Lancelot saves her by conquering her accuser, but receives wounds which break open at the next secret meeting between them. Scandal

has been busy; spies are on the watch; and, although, when the lovers are surprised, he escapes by dint of hard fighting, the stains of blood found in the queen's bed are sufficient to condemn them. She is doomed to the stake, but at the moment of execution Lancelot appears and rescues her. They fly together to his castle of Joyeuse Garde, in which he is soon besieged by King Arthur, the king's nephew Gawain, and the other faithful knights. He offers to give up the queen if no harm shall be done her; Arthur rejects the offer; and, after long fighting, news comes of a papal interdict promulgated against the kingdom so long as King Arthur refuses to take back his wife. Guinevere is then received by her husband, but Arthur is advised by Gawain to continue the war against Lancelot, whom he follows to his castle of Gannes in France. During the siege Arthur has tidings of an insurrection in Britain: his nephew Mordred has seized the throne, and the queen has fortified herself in London against the usurper. He returns, and after a series of desperate battles Mordred is killed and Arthur wounded to death. Flinging his sword away, the king disappears from mortal view and is borne by fairies to Avalon. Lancelot also returns to England, laments the king's death, pays a mournful visit to the queen, now in a nunnery, retires himself to a monastery, and dies soon afterwards in sorrow and repentance. The original *Lancelot* was the true Arthur or Round Table romance, although when first written it probably contained no mention of Perceval and Galaad. To it all the other tales and episodes gravitated, and the above analysis represents probably its final form about the year 1200. When at a later period, in the 13th century, it was abridged, and the *Bret* (Tristan) also, and both of them amalgamated in the general Arthurian work now extant in many MSS. of the 14th and 15th centuries, the compilation came into existence which was translated into English by Sir Thomas Malory under the title *Morte Arthur*. The original complete *Lancelot* may be considered as a corporate work including the five branches which had previously been separate, namely, (1) Merlin; (2) Arthur and the Round Table; (3) Arthur, Guinevere, and Lancelot; (4) Joseph of Arimathea and the Grail; the Quest of the Grail and Perceval modified into (5) the new Quest of the Grail and Galaad. A sixth element was added in the French compilation, which formed the original of the *Morte Arthur* of Sir Thomas Malory, namely, (6) the story of Tristan and Yseult.

V. *Tristan*.—This beautiful Breton or Cornish romance was originally a work totally independent of the Arthurian, Round Table, and Grail fictions; and, if it is said by Hélié de Borron to have been left incomplete by its first author, the Anglo-Norman knight Luc or Luces, of the castle of Gast, Galt, or Gau, near Salisbury, and by Gasse li Blont (Eustace Blunt), who is spoken of as a continuator, we may presume that his statement was based upon no deficiency in the original narrative, but simply on the absence of all allusion to the Round Table. He therefore set to work to produce what he called the *Bret*, or the complete *Tristan*, by constructing a number of episodes which exhibit Tristan as one of the Round Table knights, as also having engaged in the quest, and as having been with his lady-love entertained for some time at Lancelot's castle of Joyeuse Garde. The Saracen knight Palamedes, who takes an important place in the complete *Tristan*, and who is not one of the least interesting characters, seems to have been one of the additions. Whether the first author was really a knight or not, and whether he wrote in poetry or prose, it may here be said once for all that the earliest exoteric reference to the authors of the Round Table romances is that of Hélinand, who, writing close to the date of Walter Map's death (c. 1210), mentioned them as "quosdam procures," a phrase which could only be used as indicating personages ranking at least as high as knights. Tristan (in the old English form, *Tristram*) of Lyonesse is the nephew of King Mark of Cornwall.³ Warned by a dwarf that his nephew's existence will be pernicious to him, the king resolves to compass his death. His attempt is frustrated: the child is carried to the court of the Frank king Faramond, and there grows up towards man's estate. He wins the love of Faramond's daughter, on the discovery of which he is compelled to fly to his uncle at Tintagel, with whom a reconciliation is effected. A prince called Morhoult or the Morhoult⁴ of Ireland lands in Cornwall to claim tribute of King Mark. Tristan challenges him to single combat, wounds him mortally, and compels him to embark in a dying condition, but is himself wounded by the poisoned lance of his adversary. Seeking afterwards a healer for his wounds, he is borne by the wind to Ireland, and well received by the king of Ireland and his daughter Yseult, who restore him to health. It is, however, observed that he is wearing the sword of Morhoult, and he is obliged to take a hasty departure. On his return to Cornwall the incidents of the complete *Tristan* begin to connect him with Arthur and the Round Table, but his victory over a knight, there said to have accused the

¹ As Chrestien never finished his poem, and as he had two or three continuators before 1244, he may not be responsible for the Borronesque ending; but it is to be remarked that Robert de Borron and Chrestien were both from Champagne.

² Whatever be the meaning of the Welsh name Peredur, that of Perceval seems to be also British and to mean "possessor of the Grail." It may not have been one man's appellation but a title applicable to Bron, Alan, or the last achiever. The British words of which it seems compounded are *perchen*, a root which implies ownership or possession, and *mail* (initially inflected *vail*), a cup or chalice, so that the earliest form was perhaps *Perchenvail*.

³ His father Meliadus and mother Isabel, as well as the preceding generations of ancestors, were probably invented by Hélié de Borron, as well as the account of his premature birth in the open country.

⁴ Is this a corruption of Muirheartach or Muirhartach, and, if so, was it suggested by a recollection of the visit of Diarmuid MacMuirheartach to England to claim help from the Normans in 1168?

Irish king of treason before King Arthur, is probably part of the original tale. He goes with the absolved monarch to Ireland at his request, and is prayed to accompany Yseult to Cornwall, whither her father sends her as King Mark's bride. Yseult's mother delivers a philtre or love-potion to Brangian (or Bronwen), her daughter's nurse, which the latter is commissioned to give Yseult to drink on the wedding-day, in order that she may conceive a true wifely affection for her stranger husband. Brangian, however, gives it to Tristan and Yseult, who drink, unconscious of the spell that is about to influence their lives. They love each other at once and for ever. During the voyage they land on an island, where Tristan, by overcoming an enchantment, proves that he and his companion are the best knight and fairest lady in all the world. They reach Cornwall at last, and think with dread on the approach of the fatal night which is to separate them and to make King Mark aware of his bride's fault. A device, which appeared to the old romancers one of easy performance, is suggested by Brangian, who, to save her mistress's honour, takes her place on the marriage night, trusting that King Mark's carousals and the darkness will cover the fraud. The scheme is carried out satisfactorily; but the fair Yseult hires two ruffians to slay Brangian, lest the fact should ever come to light. The intending murderers, however, are smitten with pity, and simply leave their victim bound to a tree, from which position she is soon afterwards rescued. As her rescuer was Palamedes, the Saracen knight, who must be looked upon as one of the inventions of Hélié de Borron, we may venture to hope that Yseult's unwomanly cruelty formed no part of the original story. Palamedes is a magnanimous and interesting character, who loves Yseult with a purer love than Tristan, and who spends his life in a generous antagonism to his rival. The man who invented Palamedes and Guiron must have been himself a knight of the noblest type. The intrigue of the two lovers is carried on for some time, till Mark's suspicions are aroused and Tristan leaves Cornwall. Again he receives by treachery a poisoned wound; but, as he cannot return to Mark's court to obtain healing at the hands of the fair Yseult, he decides upon going to Brittany, to seek a remedy there from her cousin, the white-handed Yseult, who is equally expert in treating wounds. She cures him and falls in love with him; he marries her from gratitude. The description of the wedding night proves that he still loves the other Yseult, for he remains faithful to her in the most material point, the white-handed lady being so innocent that she is unaware of the slight cast upon her charms. He makes his wife's brother Peredur or Pheredur his confidant, and the two quit Brittany together and reach Cornwall. A fresh source of misery opens for him now, as Pheredur falls in love with fair Yseult. Tristan becomes insane and wanders away; but after some time he is brought back to the court, where Yseult restores him to reason, at the cost, however, of reawakening the jealous wrath of King Mark, who compels him to quit Cornwall, making him swear never to return. Hélié's Tristan now joins the Round Table company at King Arthur's court, and King Mark, still unsatisfied, goes thither also with the purpose of bringing about his nephew's death. The unfavourable view of Mark's character is here heightened by making him speak and act in the most ridiculous manner. Arthur reconciles the uncle and the nephew; Tristan goes back with Mark, and frees Cornwall from an invasion by the Saxons; but he fails to win favour from the king, who puts him in a dungeon. He is released by an insurrection and King Mark himself is imprisoned; Tristan flies with Yseult and is received in Joyeuse Gardé by Lancelot, until King Arthur brings about a fresh reconciliation, and Yseult is restored to Mark along with his kingdom. Tristan now returns to his neglected wife, but finds that a revolt has fortunately saved him from the necessity of repaying her devotion with caresses. He goes forth to fight, and subdues the rebel count, but is sorely wounded again. The white-handed lady tends him, cures him, and becomes his wife in deed as well as in name. He quits her once more, and renews his secret intercourse with fair Yseult in Cornwall, until discovery compels him to return to Brittany. In giving his aid to the unsuccessful prosecution of an amour by his brother-in-law he is once more poisonously wounded. He comes to such a dangerous pass that at last he sends a secret messenger to fair Yseult, to bring her back with him if possible. Should she be able and willing to come the ship is to be rigged with white sails; with black, on the contrary, if the mission is unsuccessful. Tristan's anxiety comes to the knowledge of white-handed Yseult, who, seized with sudden jealousy, when the white-sailed vessel comes gaily dancing over the waves, goes to her sick husband and tells him that the sails are black. He bids her at once farewell and dies of a broken heart. Fair Yseult, on reaching land, hears of his death, makes her way to the chamber where his corpse is lying, and dies upon her dead hero's breast. Their bodies are conveyed to Cornwall, along with Tristan's sword, formerly Morhoult's, and Mark learns the story of the love-potion. Seized with pity, he has the two lovers buried not far from each other, and a wondrous tree extends its branches to overshadow their two graves.

Palamedes: Meliadus and Guiron.—This, the last romance

written by any of the original writers of the Round Table stories, Meliadus was composed by Hélié de Borron about 1220 at the desire of and Henry III. of England (who paid him noble guerdon for his labour). Guiron. He had already made Palamedes (the Saracen knight finally baptized and adopted to the Round Table) so prominent and so noble a character in his *Bret*, or romance of *Tristan*, that the king wished for another book on the subject. Since the story was to be one of knightly courtesy, its name should be *Palamedes*. As that hero takes only a minor part in the transactions of the story it is difficult to believe that he meant the name as other than a metaphor. The book is divided into two distinct tales,—one relating the adventures of Meliadus, who begat Tristan upon the adulterous queen of Scotland, and the other those of a knight whose name appears here for the first time,—Guiron le Courtois.¹ *Meliadus* is a dull and clumsy composition, chiefly remarkable for the circumstance that it alludes to the Charlemagne romances, and includes among its personages Aryhoan of Saxony, ancestor of Ogyers le Danois (Ogier the Dane). Even the account which it gives of Tristan's birth is wholly at variance with that which the writer had already given (or accepted) in the romance of *Tristan and Yseult*. As for Guiron, the beauty of his character redeems the tediousness of the narrative. From the point of view of human noble-mindedness it is the best of all the Arthurian tales, Guiron being equally free from the criminal sensuality of Lancelot and Tristan on the one hand, and distant from the superangelical purity of Galaad and Perceval on the other. Under the most trying circumstances he keeps himself chaste aloof from sin, although love is mutual between himself and his friend's wife; and, when on one occasion he reflects how near he has been to the verge of criminality, he strikes his own sword into his breast as a punishment. It is needless to say that he does not die but lives to see that same friend, Denain le Roux, carry off a maiden on whom he (Guiron) has bestowed a more justifiable affection. When, after a year's vain search, he meets his false friend and his ravished lady-love together, he fights and conquers Denain but spares his life, and goes away with the lady, still in love with her. Denain exhibits his friendship and gratitude effectually afterwards, but the story is left unfinished, Guiron and Bloye having been entrapped by treachery and lying still within the walls of a dungeon. The author refers to his *Meliadus* for an account of their liberation; but this simply shows that he intended to rewrite *Meliadus*. Fifty or sixty years later Rusticien de Pisa abridged the *Palamedes*, and inserted the incidents of the two in his compilation of Arthurian romances, now lost as a whole, although usually confounded with the *Morte Arthur*. From his compilation the printed *Meliadus* and *Guiron* were further abridged and finally printed so in separate form.

Ysaie le Triste, Arthus de Bretagne, and Perceforest are three Ysaie, romances which had also considerable vogue, but, although they Arthus belong to the Arthurian cycle, they have no real connexion beyond de Bret—the use of British names and the supposed kinship of the heroes aigne, with those of the old stories. Almost as much might be alleged and against the *Meliadus* and the *Guiron*, but they were at least written Perceby one of the first authors of the genuine works, and he had pre-forestsumably some acquaintance with the British folk-legends. The fact that Rusticien de Pisa about 1270-75 abridged and compiled in a single great book the scattered and discordant stories of the earlier period, at the request of Prince Edward (afterwards Edward I.) of England, is universally conceded. That compilation has never been printed; it is even uncertain whether any MS. in existence represents it, for, although the English *Morte Arthur* is usually supposed to have been compendiously translated from it, we may infer with greater probability that Sir Thomas Malory used an earlier compilation, perhaps the work of Hélié de Borron. One reason to justify such a conjecture may be found in the absence of *Guiron* and *Meliadus* from the English book, which would hardly be the case if the former notion were correct, since we know that Rusticien published an abridged text of those two works. Rusticien's compilation could in fact only be recovered approximately by reuniting the texts of the various Arthurian romances as printed in French in the 15th and 16th centuries,—these abridged and inferior texts having apparently been derived or rewritten from his book, not from MSS. of the separate old romances. The *Morte Arthur* was printed by Caxton from Sir Thomas Malory's MS. translation or adaptation made in England not many years before the printer's establishment at Westminster. As an early English text and as the only existing homogeneous embodiment of the ancient Franco-British romances, it is of the highest interest, while at the same time it breathes the earnest and simple feeling which animates the originals,—differing thus *toto calo* from the colder, more artificial, and less interesting narratives which were invented in the 15th century, and of which the *Ysaie, Arthus de Bretagne, and Perceforest* are examples. All three may be referred to the first half of that century, although it has been alleged that the second was written in the 14th. *Ysaie* forestalls to some extent the type of the 16th and 17th century French romances. It is an early instance

¹ Guiron appears to be the Breton or Cymric word which means "loyal," "true," or "honest," and is a fitting title for the hero.

of the use of a favourite device in later fiction, by which fairies are introduced who bestow special gifts at the birth of a hero; and amongst its chief personages is the misshapen dwarf Tronc, afterwards named Aubron—that is, Oberon—and made beautiful. He was adopted from the old French story of Huon de Bordeaux, just as the Oberon of the latter had his origin in the Elberich of the *Heldenbuch*. The original composition of *Perceforest* has been assigned without reason to the 13th century, and it is possible that some insignificant portion of the romance may have been written in the 14th; but the probability is that David Aubert was the real author of the extant work, and that he wrote it at the court of Burgundy about 1450. It would be difficult to imagine a work more absurd, heterogeneous, and wearying in its immensity than this. The very "variety" for which Dunlop praises it merely indicates the mass of multifarious and incongruous incidents, unconnected and uninteresting, of which it is full. Antiquaries, however, find it useful for the history of those knightly sports called tournaments, immense numbers of which are described in minute detail. *Arthur of Little Britain* must have been considered a very interesting romance when Lord Berners translated it into English, but we cannot discover its attractiveness. It is a dull inartistic composition, with scarcely any distinctiveness in the drawing of its personages.

Minor
Arthur-
ian ro-
mances.

A great number of poetic and prose compositions, beginning with chansons and fabliaux in the 12th and 13th centuries, form a large portion of the literature of Arthurian romance; but in most instances they deal only with episodes, and are better described in the articles relating to the literature to which they belong than they could be, or ought to be, here. Some of them may, however, be mentioned briefly in chronological succession. In the 12th century—that is, between 1170 and 1200—Arnaud Daniel the troubadour wrote a poem, now quite lost, on Lancelot and Guinevere; Chrestien de Troyes the trouvère wrote one entitled the *Charrette*, i.e., in reference to Lancelot's unknighly mode upon one occasion of hurrying to the rescue of Guinevere in a cart for want of a horse; this story was continued by Godefroi de Leigni. Chrestien wrote another poem on (Peredur) *Perceval*, which was continued by three other hands, in which Perceval remains the achiever of the Grail-quest. He also wrote *Erec et Enide*, a poem which contains the same substance as the Welsh story of Geraint in the *Mabinogion*, and which never appeared in any of the Arthurian romances; and the *Chevalier au Lion*, which is similarly identical with the Lady of the Fountain in the *Mabinogion*. Owen or Ywain, the Chevalier au Lion, is a prominent Round Table knight in the romances, but his story is not incorporated in them. Hartmann von der Aue translated Chrestien's poem into German verse before 1200; in English it appeared as *Ywain and Gawain* in the 14th century; another English poem, *Sir Gawaine and the Green Knight*, was written about 1360, as well as a Scottish *Golagrass and Gawaine*, in the 14th century. A poem, dated 1212, containing *Le Roman de Joseph d'Arimathie*, has been published by Francisque Michel, and is supposed by many to be Robert de Borron's original work. Its substance is the same as the first part of the prose *Petit Graal*, which Hucher has published as Borron's real original. About the same time, or a few years earlier, Ulrich von Zatzikhoven translated Arnaud Daniel's *Lancelot* into German verse; the lost *Perceval* in verse of Guyot de Provins and Wolfram von Eschenbach's metrical German version of it (in which he miscalls the trouvère "Klot der Provençal") have already been mentioned. There is an early German poem called *Wigalois*, composed by Wirnt of Grafenberg (i.e., Gui, son of Gawain), evidently derived soon after 1200 from a French original, *Gui Gales or Giglan*, which is lost. On Gawain himself there are two French poems by Raoul and Renault or Raoul de Beaujeu, of the 13th century; and one of Chrestien de Troyes's chansons (before 1200) celebrates Cliges, a nephew of Gawain. A French poem on Merlin dates from about 1300. There is a *Petit Tristan* or *Brun de la Montagne*, written in verse in the 14th century. The French poems of Marie de France, written in England early in the 13th century, contain lays of *Lanval* and of *Chevre-feuille* (on Tristan), which are professedly Arthurian subjects. Of the English works on the Round Table romances the chief are the metrical *History of the Grail*, translated early in the 15th century by Henry Lonelich, and published from a MS. by the Roxburghe Club, and Sir Thomas Malory's *Morte Arthur*. An English prose romance of Merlin was written about 1450, and a metrical *Arthur and Merlin* is probably fifty or sixty years older. A further *Life of Arthur* in English verse is supposed to have been composed about 1428. There is a metrical version of Renault de Beaujeu's *Giglan*, probably of the latter part of the 14th century. Two poems both entitled *Morte Arthur* exist, one written about 1390, which especially treats of King Arthur, and another belonging to the middle of the 15th century, of which the story of Lancelot is the subject-matter; and there is a Scottish *Lancelot of the Laik* in verse, which was composed late in that century. A romance of the *Seint Graal*, in verse, written about 1350, was probably a translation of Robert de Borron's *Joseph d'Arimathie*. Between 1838 and 1849 Lady Charlotte

Guest printed and translated the *Mabinogion* (Children's Stories) from the Welsh MS. known as the *Llyfr Coch o Hergest*, transcribed late in the 14th century, and now preserved at Oxford, in the library of Jesus College. At first it was believed that these stories, so far as they agreed with the narratives of the printed French romances, were copies of the original legends used by Walter Map and the Borrons; but there can be little doubt that only those portions which are not found in the romances are of independent Celtic or Cambrian origin, while the remainder was derived from the French stories or poems of the 13th and 14th centuries.

BIBLIOGRAPHICAL LIST OF EARLIEST EDITIONS OF CHIEF ROUND TABLE ROMANCES.—*Partisyal und Titurel*, in German verse, 2 vols. fol., 1477. This book is a translation by Wolfram von Eschenbach, about 1205, of Guyot's lost French poem, based upon Robert de Borron's *Histoire du Graal*. *Perceval*, fol., Paris, 1530. A totally distinct work from the Franco-German *Partisyal* mentioned above. Various poems in French and English of early date exist on the adventures of Perceval, but they are not to be identified with the prose romance.

Morte Arthur, fol., print. by William Caxton, 1485. Sir Thomas Malory's English translation of the second French Arthurian compilation which had been made about 1250, and united Tristan with the so-called *Lancelot*.

Lancelot du Lac, 3 parts, fol., Rouen, 1438; and Paris, A. Vêrard, 1494. This, the first Round Table compilation, was made about 1300, and embodied three or four tales which had previously had a separate existence. An Italian translation appeared in 3 vols. 8vo, Venice, 1558-59. A Spanish translation appears to be the *Demanda del Sancto Graal*, fol., Toledo, 1515, which may possibly be the whole *Lancelot* notwithstanding its name. A Dutch *Roman van Lancelot* of the 13th century was printed by Jonckbloet in 2 vols. 4to, 1846-49, from a MS. It may not be a translation of the French romance. The Maitland Club printed in 1839 a *Lancelot du Lac* in Scottish metre, from a MS. of the 15th century.

Tristan, fol., Rouen, 1489; and Paris, Vêrard, about 1499. *Don Tristan de Leonis*, fol., Valladolid, 1501, is a Spanish translation. The Italian *I due Tristani*, 2 vols. 8vo, Venice, 1555, is a compilation of the two romances of Tristan and his son Ysaie. The two stories were united also in the late Spanish versions, if not in the first edition of 1501. A Scottish poem on *Sir Ystram* was written by Thomas Rhymer of Ercildoune in the 13th century; published by Sir Walter Scott. Various early poems on the same subject have been printed in *Tristan* by Francisque Michel, 2 vols. 12mo, 1835-37. A German poem of *Tristan und Iside*, begun by Gottfried of Strasburg early in the 13th century, and continued by others in the same century, was published at Berlin in 1821, 4to, by Grotte, and by Von der Hagen in 2 vols. 8vo, Breslau, 1822. This poem and the Scottish one are supposed to be derived from a French *Tristan* in verse by a trouvère Thomas, which is included in Michel's *Tristan*. There exist also an Icelandic *Saga of Tristan og Isold*, of the 13th century, published in Muller's *Saga-Bibliothek*, and old popular chapbooks on the same subject in German, Danish, Italian, Bohemian, and modern Greek. The oldest German edition of the popular *Tristrant* was printed in 4to at Augsburg in 1484.

Artus de Bretagne, fol. (no place), 1493; also at Lyons in 1496. An English translation was made by Lord Berners, *Arthur of Lytell Brytayne*, fol. (print. by Robert Redborne, no date, but probably about 1565).

Vie et Prophéties de Merlin, 3 vols. fol., Paris (ed. Vêrard), 1498. There exist an Italian translation, *Historia di Merlino*, made by Antonio Tedeschi in 1879, fol., Venice, 1490, and a Spanish translation, *El Balaadro del Sabio Merlín*, fol., Burgos, 1498. The *Lytel Treatys of the Byrth and Prophecie of Merlín*, published by Wynkyn de Worde, 4to, 1510, is a popular poem; and the *Life of Merlín*, 4to, 1841, is an original work by Thomas Heywood. The Early English Text Society has published *Merlin or the Early History of King Arthur* (8vo, 1869-77), in prose, from an English MS. of the 15th century, which was made from a French original. There exists also an *Arthur and Merlin* in verse, written about 1400, which has been printed for the Abbotsford Club, 4to, 1838. Geoffrey of Monmouth's original *De Vita et Vascinis Merlino*, in verse, was printed by the Roxburghe Club in 1830, 4to. His prose narrative (portion of the *Historia Brittonum*) was first printed in the *Britanniae virtuosae Regum Origine*, 4to, Paris, 1508, and afterwards better in the *Heidelberg Script. Berum. Britann.*, fol., 1587.

Gyron le Courtois, fol., Paris, Vêrard, no date (about 1501). Two old Italian translations of the 14th or 15th century have been printed from MSS. in Italy, 8vo, Verona, 1834, and 8vo, Florence, 1835. Alamanni's *Girone el Cortese* is a poem on the subject of the romance, written for Francis I., 4to, Paris, 1548.

Histoire (et Queste) du S. Graal, fol., Paris, 1516. The Spanish *Demanda del Sancto Graal* and *Balaadro de Merlín* have probably no connexion with this book, but are rather to be considered as drawn from the *Lancelot*. A French poetic *Roman du Saint-Graal* of the beginning of the 14th century has been published by Francisque Michel, 12mo, Bordeaux, 1841; and a prose one of earlier date (perhaps the remote original of the French romance printed in 1516) has been published by Hucher, 12mo, Le Mans, 1874. The Early English Text Society has printed (8vo, 1871) a 14th-century poem, *Joseph of Arimathæa*, derived from the earlier French. The English verse *Seynt Graal*, by Henry Lonelich, published by the Roxburghe Club, 4to, 1868-64, must be considered as derived from the *Lancelot* rather than from the *Histoire du S. Graal*.

Ysaie le Triste, fol., Paris, 1522. For Italian and Spanish translations see *Tristan*, above.

Meliadus de Leonnoys, fol., Paris, 1528. Of this there exists an Italian translation, *Egredi Fatti del gran Re Meliadus*, 2 vols. 8vo, Venice (Aldo), 1559-60.

Perceforest, 6 vols. fol., Paris, 1528.

(b) *Charlemagne and his Twelve Peers.*

The cycle of Franco-Teutonic or French romance of which the mythical history of Charles the Great forms the central design is, so far as its original literary elements are concerned, more ancient than the Franco-British cycle of Arthur and his knights. The reduction into prose of the old *chansons de geste* and of the *poèmes cycliques* which followed them was, however, of much later date than the similar conversions of Round Table poems; and the 15th century prose romances are so mangled and altered from the character of the earlier stories in verse that without a short notice of the latter it would be impossible to get a

true notion of the richness and copiousness of Frankish romance.

We know from Eginhard that the Frankish heroic ballads were reduced to writing by Charlemagne's order, and thus the first step was taken which led to the creation of similar ballads about himself and his principal warriors. His own large and catholic spirit seems to have embraced all the people within his dominions, and thus indirectly brought about the official employment of the French language in the famous compact between his grandsons in 841. He was then only twenty-eight years dead, yet his influence was still so mighty that even the Gauls and Aquitanians are declared in a 9th-century chronicle to have gloried in bearing the name of Franks. This both implies an amalgamation of the two races more complete than is usually believed, and accounts for the creation of French as well as of Frankish ballads on the life and exploits of Charlemagne in the second half of the 9th century. The number of persons who could speak only Theotisc (Teutonic language) and of those who could speak the two languages was of course constantly diminishing, and the *chanson de geste* soon displaced the *Heldengedicht* within the limits of modern France. Of all the French ballads current in the 9th and 10th centuries some have perished utterly, others survive only in later refusions; the most ancient now extant is the *Chanson de Roland*, in the modified form which was given to it soon after 1066 by a Norman called Turolf. This poem contains so many references to others on Charlemagne and his *douze pairs* or *paladins* as to make it certain that such a ballad-literature existed in the 9th and 10th centuries. None of the existing *chansons de geste* represents those older forms; all are rifacimenti of the 12th and 13th centuries, and bear evidence of additions, interpolations, and arbitrary changes. In the 13th century we find the older episodic ballads rearranged in the form of "cyclic poems," and falling into three groups, which take each its name from the central personage or subject. One is the *Geste* of the king (Charlemagne, his father, and grandfather); the next is the *Geste* of Provence or of Garin de Montglane; and the third, the most heterogeneous, is the *Geste* of Doon of Mayence. Each of these is composed of many separate parts, but the first may be generally described as the entire mythical history of Charles the Great, his family, and his faithful peers; the second a separate and independent set of narratives concerning his conquest of Narbonne; the third a history of his wars with rebellious vassals and with traitors, including Ganelon, through whom the peers were defeated and slain at Roncevaux. The number and names of the peers are variously given in nearly all the poems, but Roland and Oliver are included in all the lists, united as in a proverbial English phrase. Roland is the daring warrior, Oliver the wise one; the one is the Achilles, the other the Ulysses of the Carolingian epopee. Many of the early *chansons* give the name of Turpin, archbishop of Rheims (an actual historical contemporary of Charlemagne), as one of the *pairs*,—warrior and priest combined; and there is a chronicle bearing his name which has furnished the later romancers with a goodly proportion of their matter. This *Pseudo-Chronicle of Turpin* was written in Latin, by various hands and in various places between 1000 and 1150, being apparently constructed from the *chansons* for the purpose of forging history to suit monastic ends. It took its final and existing form between 1160 and 1180, when edited by Geoffroy de Brueil, and was for many centuries regarded as actual history. This work was not the first so-called history which embodied monastic fiction in the narrative of Charlemagne's career. A monk of St Gall wrote about 890 a chronicle *De Gestis Karoli Magni*, based partly upon oral tradition,

in which certain fabulous incidents appeared for the first time, such as Pippin's fight with the lion, and the conversation about the Iron Emperor between Ottokar the Frank (better known as Ogier the Dane) and the Lombard king Desiderius, on the walls of Pavia, when Charlemagne was advancing to besiege it. Another fabulous incident of great moment in the romances is Charlemagne's supposititious journey to the Holy Land, which was related for the first time by Benedict, monk of St André, about 968, in his *Descriptio qualiter Carolus M. Clavum et Coronam Domini a Constantinopoli Aquisgrani attulerit*.

A great deal of historical truth underlies the absurdities of the *Turpin Chronicle* and the rhapsodies of the *chansons de geste*. Compare *ROLAND, LEGEND OF*. In fact all the older poetic literature of this cycle is based upon purely historical events and real personages; it is only at a later date that the events are multiplied or variously misapplied, and that the personages also are arbitrarily distorted and augmented, according to the fancy and local sentiments of the various writers. As for the language in which the older poems were written, the idea that they were chiefly the work of troubadours in the *langue d'oc* is now abandoned. Gaston Paris holds the curious theory that the French language (*langue d'oïl*) was popularly current over the north of Italy, instancing the works of Rusticien of Pisa as an illustration, besides certain works in Italianized French which belong to this class. Such a notion cannot be accepted readily, as we know that the *langue d'oc* was the general language of southern France, western Spain, and north-west Italy. But it is possible that the French language (*langue d'oïl*) may have been used as a general literary vehicle for the Charlemagne cycle of poetical fiction, and that Rusticien or Rustighello may have compiled an abridgment of the Frankish stories. Such a work, if it ever existed, has perished; and it is in the Italian language of Tuscany that we find the first prose compilation of Carolingian romance. The *Reali di Francia* (Princes of France), if it had been completed, would have occupied a corresponding position to the *Morte Arthur* of the British cycle; for, while no such popular compilation appears to have ever been made in France itself and in the French tongue (unless the late 15th-century *Fierabras* may be considered to take that rank), the *Reali* in verse and in prose was current in Italy early in the 14th century. From some peculiarities in the language it is conjectured that the author, although writing in Tuscan, was a Venetian. In France at the same period we find only the separate fictions, mostly in verse, but a few in prose. The first French prose compilation of the whole cycle was made by David Aubert in 1458 for Philip of Burgundy; but it was dead-born and has never been printed. The second, in three books, was made a few years later by Jean Bagnyon, for Henri Bolomier, canon of Lausanne; it was first printed in 1478, and is entitled in some editions *La Conquête que fist Charlemagne es Espaignes*, and in others *Fierabras*; both titles are insufficient, having apparently been merely created to supply the lack of a general heading. The first section is a summary chronicle of the history of the Franks from Clovis to Charlemagne, the second an abridgment of the old poem of *Fierabras*, and the third an account of the Spanish expedition, taken from the *Pseudo-Turpin*. This work became very popular in and out of France, and most readers during the 16th and 17th centuries derived their entire knowledge of the Charlemagne romance from it. Although the French prose works of the cycle were for the most part very late in their construction, there were three French prose translations or adaptations of the *Turpin Chronicle* executed soon after 1200.

The names as well as the offices of the *douze pairs* varied

French
ballads.

Historico-
mythical
works.

Charlemagne's
paladins

considerably in the earlier *chansons*. The final conception appears to be that which is contained in the *Fierabras*; but the substitution of new personages for the old ones is so great that it is not possible to regard the *douze pairs* as a definite set of *dramatis personæ* on the stage. Nor indeed do any of the heroes of the printed prose romances belong to that society, however frequently its members appear in their stories. Originally it would seem that some fortuitous coincidence between the number of the apostles and the number of the captains who headed Charlemagne's evangelizing expedition into Spain had been utilized by some of the monkish legendaries, and thus the early *chansons* became affected with a mystic respect for the *douze pairs*. But each writer allowed himself the licence of excluding and including any warrior he chose in that number. The *Pseudo-Turpin* makes no reference to such a society, although it gives the names of the more celebrated knights. The full story of Roland has no prose romance to itself (see *ROLAND, LEGEND OF*). The story of Oliver is in similar case, unless the prose romance of *Galien*, Oliver's son, may be held to embody it. Regnault de Montauban (the chief of the four sons of Aymon), Huon of Bordeaux, Amys and Milles, Jourdain, Galien, Maugis, Mabrian, and many other heroes of the printed romances are unknown to the earliest ballad-histories of Charlemagne and his barons. Ogier the Dane seems to have grown out of two historical personages, a real Othger or Ottokar, a Frankish margrave of Charlemagne's time, and a real Olgar or Hulger, a Danish or Norse warrior who plundered Aix-la-Chapelle some seventy odd years after the Frankish Othger had accompanied Roland into Spain. Othger fought with the Lombards against Charlemagne in 773; and Amys and Milles, in the battle in which they won the crown of martyrdom, are said to have fallen by his hand. Beaten by the emperor, he became his vassal and five years later commanded the advanced guard of the army whose rear-guard was destroyed at Roncevalles. M. Gaston Paris has admirably discussed the historical bearings and the various phases of the original *chansons de geste* in his *Histoire Poétique de Charlemagne*, but has dismissed with a brief reference all the printed prose romances we are now about to consider.

Real di
Francia.

The *Real di Francia* exists both in metrical and in prose form, and it is difficult to decide which is the earlier; the metrical version was certainly current in the 13th century, and there seems little reason to doubt that the prose story was in existence before 1300. The latter was first printed at Modena in 1491. It is a general work on the subject of Frankish romantic history, and is divided into six books, of which the subjects are as follows:—(1) Clovis and Rizier; (2) Fioravante and Rizier; (3) Ottaviano de Leone (the emperor Octavian and his sons Florent and Lion); (4) Buovo d'Antonna (Bevis of Hampton); (5) Buovo avenged by his sons Guido and Sinibaldo and King William of England; (6) birth of Charlemagne, death of Pippin and his natural sons. Thus we may conclude that it was, so far as printed under the name *Real di Francia*, the first part of a compilation of all the Charlemagne cyclical stories. The first book of the continuation *Aspremont*, a translation from the French poem of *Aspremont*, or rather a prose composition from an Italian version of that poem, exists in MS. The *Real di Francia* has been drawn upon by many later writers.

Pseudo-
Turpin.

Chronicle of the Pseudo-Turpin.—The early part of this work was evidently forged by some monk interested in exalting the glory of St James's shrine at Padron in Galicia (Spain), before it was transferred to Compostella. He represents St James as appearing in successive visions to Charlemagne, urging him to conquer Spain, the land in which the saint's bones are laid and of which the Saracens are masters. Charlemagne advances with a Frankish army and besieges Pamplona, which is invincible to his arms, but falls a prey to his prayers. After further exploits and the foundation of many churches, he returns home, but is brought out again very speedily by news that the Saracen king, Aigoland, has once more seized the country. This king is borrowed from the older *chansons* relating to the war against the Lombards; but for the 12th century all Charlemagne's foes were Saracens. The topographical difficulty is made light of, and Aspremont is placed in Spain. Roland, Oliver, and Ganelon (afterwards infamous for his treachery, the hereditary result of his kinship to the family of

which Doon of Mayence was the head) distinguish themselves; Aigoland is beaten and killed. Charlemagne next attacks Navarre, where his paladins enter into single combat with the heathen giant Ferracute, who vanquishes all but Roland, and is overcome by the latter by means of a stratagem. Cordova is next conquered and taken possession of, and Charlemagne retraces his steps, but remembers that he has left two other Saracen kings unsubdued—Marsilius and Baligant—in Saragossa. He sends Ganelon to claim tribute from them; they contrive to rouse the predestined spirit of traitorousness in the envoy, and he returns with a false tale, which leads the monarch to forget military precautions by dividing his army into two portions. He himself with the advanced half passes the Pyrenees in safety, but Roland, Oliver, and the rear-guard are suddenly attacked in the pass of Roncevalles. All perish in the fight except Roland, who, mortally wounded, dies alone in the wild mountain gorge, after having flung his famous sword away, and blown such a blast upon his horn that it bursts and the sound reaches the ears of Charlemagne. The emperor returns to Roncevalles, slays the Saracen host, recovers the body of Roland and gets it embalmed, and causes Ganelon to be torn to pieces by wild horses. After a time his health suffers and his death approaches. Turpin becomes aware of a multitude of demons who are preparing to carry off the emperor's soul on account of his sins. They are foiled, however, by St Denis, who, in return for Charlemagne's benevolence towards the church, rescues his soul and bears it to heaven.

Fierabras.—The basis of this romance was the lost poem upon *Fierabras*, the amir Balan, a Saracen leader conquered by Charlemagne in bras. Italy; the rest of the book was put together from Turpin and other sources so as to form the one general prose romance of Charlemagne. The scene is changed from Italy to Spain in the prose romance. *Fierabras*, the giant, is son of Balan, and, after having sacked Rome, is met by the Frankish host; Oliver encounters and defeats him in single combat; the giant is converted and baptized by the name of Florent, and receives half his father's kingdom when his father is conquered and slain. Floripas, sister of *Fierabras*, marries Gui de Bourgogne, who takes the other half. The Spanish prose *Historia del Emperador Carlo Magno*, printed in 1528, is a translation; there is also a German version.

Guerin de Moniglave (or properly *Garin de Montiglave*).—This *Garin de* romance of the 15th century is based upon the 13th-century poems *Monton* Girard de Vienne and *Aimeri de Narbonne* of "le clerc Bertrand." *Glane*. It is a spirited and entertaining fiction relating the adventures of the four sons of Garin, one of the heroes of the elder Provençal cycle, and is misnamed, in so far as it contains only the story of his family, not of himself. The four sons are sent forth to seek adventures. Arnaud, the eldest, asserts his right to the dukedom of Aquitaine against a usurper who has succeeded on his uncle's death. He is treacherously persuaded to seek the hand of the princess Fregonde, daughter of the Saracen sultan of Lombardy. His traitorous kinsman, Hernault, contrives to set Arnaud and the sultan at enmity, and Arnaud is flung into a dungeon, where the daughter, ready to accept Christianity for love of him, secretly visits him. Hernault apostatizes and goes back with a promise of the sultan's help to conquer Aquitaine for himself, but turns aside from some qualm of conscience to confess his sins to a giant hermit, who happens to have been an old comrade of Garin. Thus learning the peril of Arnaud, the giant hermit Ribastre slays Hernault, and, seeking assistance from another old comrade, a converted magician named Perdigon, sallies forth to the aid of the imprisoned hero. In disguise he obtains admittance to the captive and the princess, baptizes the latter, kills the jailer, and sends Arnaud forth free to reconquer Aquitaine and to bring aid, while he and the lady hold the dungeon-tower, which is at once besieged by the sultan. After numerous fights, in which Perdigon's magic is the chief actor, Ribastre and the princess get away without having received help from Aquitaine, and on reaching that land find Arnaud a prisoner in the power of Hernault's uncle. Ribastre kills the latter; Arnaud is restored to his duchy and marries Fregonde; the sultan turns Christian; and all ends well. But the romance does not close here; it proceeds to narrate the honours which fall to the other sons, Milon de Pouille, Regnier de Gènes, and Girard de Vienne, or de Toulouse, through the favour of Charlemagne, who feels himself bound to Garin's family in consequence of the obligation attached to a rash game of chess formerly lost by him to that hero. However, when Arnaud's son has grown up, an accidental affront put upon the empress by him changes Charlemagne's friendly feeling to hate. He makes a long war upon Girard in Vienne, who is aided by his brother, and it is agreed at last to settle the affair by a duel between Roland, the emperor's nephew, and Oliver, the son of Regnier de Gènes. The two had previously become fast friends, and Roland loves Aude, Oliver's sister; consequently, although they fight with great vigour and equality of strength, they throw aside their swords in the middle of the combat and embrace one another as worthy brothers-in-arms. A fitting compromise is found between the warring parties in an agreement that they shall all unite and attack the Saracen conquerors of Spain. Then begins the famous expedition which ended at Roncevalles.

Galien. *Galien le Rhetoré.*—This romance was first printed in 1500. It is partly of late composition, although sufficiently ancient to have rendered the word "rhetoré" (*i.e.*, rhetorized, or narrated in elegant prose) incomprehensible at the time of its impression. The word was supposed to mean "restored," and to indicate the restoration of chivalry by Galien. The chief substance of the story was the ancient tale of Charlemagne's journey to the East and the *Turpin Chronicle*. Hugues, emperor of Constantinople, at first receives the Frankish emperor and his peers courteously, but is informed by a spy of certain vaunting expressions to which, as is the Frankish manner, they have given utterance amongst themselves after supper. These "gabes," as they are called, are merely frolicsome braggadocio, spoken in lightheartedness, and not intended to convey any serious intention. The spy and the Greek emperor, however, take them as the threats of dangerous magicians; the Franks are seized and menaced with death if they fail to fulfil their words. Oliver is first put to the test; his speech had had reference to the Greek princess Jacqueline, and might better have befitted the lips of a Parisian *gamin* of to-day than of a young paladin. He, however, awakens a tender interest in the lady's heart, and she indulgently informs her father the next morning that the knight's boast has been fulfilled. Hugues requires that the others shall also exhibit their power, which they do to his satisfaction, partly by celestial succour and partly by the use of mother-wit. He finally dismisses them with presents. After Oliver has gone, Jacqueline becomes the mother of Galien, who grows up in time to hear of the expedition to Spain and to arrive just too late for the battle in the pass of Roncesvalles. His dying father there acknowledges him, and Galien signalizes himself in the renewed fighting in which Charlemagne takes reprisals for the loss of his peers and the treachery of Ganelon. After various deeds of valour in the West, Galien returns to the East, saves his mother from a shameful death, and resumes the imperial crown.

Milles et Amys. *Milles et Amys.*—The prose romance in its existing form was written in the 15th century, and first printed by Vérard about 1508. The martyrdom of the two friends is supposed to have taken place in 774 in Charlemagne's war against the Lombards, and their story was popularly current in the 12th century. Milles was the son of Anceume, count of Clermont, and Amis the son of the count's seneschal. Milles's parents celebrate his birth by making a pilgrimage to Jerusalem. During their adventures and captivity in the East Milles is robbed of his inheritance at home and Amys is brought up under a feigned name. They enter into the closest friendship and set out for Constantinople, where Milles discovers his captive mother acting as nurse to the Greek princess Sidoine, whom by her assistance he weds, after having taken a chief part in forcing the sultan of Acre to raise the siege of Constantinople. He becomes emperor of Byzantium, but after a while returns to France with Amys, regains possession of his estates, and makes Amys a duke. Hearing that the Saracens have again attacked Constantinople and that his Greek wife has perished in the flames, he allows himself to be seduced by Bellisant, the daughter of Charlemagne, who, however, makes an honest man of him by marriage and behaves honourably ever after. Amys also gets married. Then the two friends also go on a pilgrimage to Jerusalem, from which Amys returns stricken with leprosy. His wife refuses to receive him, but he is carefully tended by Milles in his own castle; and now the most striking episode in the story takes place. Amys learns in a dream that he can only be healed by bathing in the blood of his friend's offspring and tells Milles of it. The latter is painfully affected, but does not hesitate to strike off the heads of his two children. Amys is cured and the devotion of Milles repaid by a miracle from heaven: the children's heads are replaced upon their shoulders. Afterwards Milles and Amys set out on another pilgrimage to Santiago de Compostella. Ogier the Dane, then at war with Charlemagne, meets and treacherously slays them on their way homeward. A continuation follows, narrating the adventures of the infant children of Milles. The widow of Amys plots for their destruction, but they are zealously tended by a wise ape, which shares their fortunes until separated from them by malice and mishap. Florisset becomes a Saracen leader in Venice and Anceume a brave warrior in the army of Charlemagne. The two brothers have a desperate encounter in the war which takes place, but are recognized by the ape (which has already brought about the punishment of the wicked widow of Amys, in a similar fashion to that of the celebrated dog of Montargis). A restoration takes place: the two young men are acknowledged the emperor's grandsons, and the ape dies of joy.

Jourdain de Blaves. *Jourdain de Blaves* (or *de Blaye*).—The prose romance, first printed in 1520, is altered from a 15th-century poem. It is affiliated to *Milles et Amys*, the hero being the grandson of Amys. He undergoes the most varied fortunes: he throws his wife with his yet unborn child into the sea, enclosed in a box, when the vessel bearing himself and his warriors is in peril of shipwreck; he searches for her some years later, and finds her in a refuge, to which she has fled from the love of the man who fished her out of the sea, and who exposed her baby-girl at the birth; and next, when hunt-

ing in a forest, he finds his daughter running wild in company with a bitch and her young. This is a reflexion of the story of Apollonius of Tyre, and is rather a dull work.

Doon of Mayence.—Doon or Doolin of Mayence is the hero of a Doon of 14th-century poem, adapted as a prose romance in the 15th century, first printed by Vérard in 1501. He is represented as defying and almost defeating his lord the emperor, whom he treats at first with disrespect. In his earlier history he appears as a son of Gui of Mayence, who, as penance for an unintentional crime, retires to a hermitage. On his disappearance his wife is accused of murder, condemned to death, and her children banished. Doon meets his father and returns to fight as his mother's champion, conquers his enemies, and assumes his rightful possessions. He falls in love with a Saracen princess and wins her by force, with the help of Charlemagne, after the episode of his quarrel with the emperor. The lady's father has been aided by the king of Denmark; Doon, after his victory, seizes the Danish crown, which he transmits through his son Geoffrey to his grandson Ogier.

Ogier le Danois.—There are twelve *chansons* upon the story of Ogier the this hero, dating from the 12th and 13th centuries, and based Dane, upon still older poems now lost. The trouvères Raimbert and Adenez le Roi were among the authors. The story was recomposed in prose, from the poem of the latter writer, probably in the second half of the 14th century. The fairies who preside at Ogier's birth and endow him with many gifts are a later addition to the story; one of them is Morgan la Fay, King Arthur's sister, who foretells that at the end of his career he shall go to live with her in immortal youth at Avalon. While yet a little boy he is sent as a hostage to Charlemagne and is brought up at the imperial court. When fourteen years of age he is banished to the castle of St Omer, where he falls in love with the young châtelaine, but is soon afterwards ordered out of his prison to accompany Charlemagne on an expedition to Italy against the invading Saracens. Here, for the first time, he is subjected to the hatred and envy of young Charlot, the emperor's son; but on the triumph of the Frankish arms he accompanies the monarch in his return to Paris and learns that his father is dead and that the châtelaine has borne him a son. He departs to assume the crown of Denmark, but lays it down after a few years and returns to Charlemagne. His son has grown up and is one day engaged in a game of chess with Charlot, who, having lost it, becomes irritated, and kills him with the chess-board (an incident frequently met with in old fiction). Ogier, in his fury for revenge, uses such language that he is compelled to fly, and betakes himself to the court of the Lombard king Desiderius, then at war with the emperor. It is on this occasion that the famous dialogue takes place on the walls of Pavia. Desiderius or Didier wonders, as he and Ogier look forth together, at the great number of the Frankish warriors advancing over the plain, and, as each successive body of troops, ever increasing in strength and grandeur, makes its appearance, he says, "Is this the emperor?" Ogier to each question answers, "Not yet," till at last he cries, "When thou shalt see the fields bristling with an iron harvest, and the Po and the Ticino, swollen with sea-floods, inundating the walls of the city with iron billows, then perhaps shall Karl be nigh at hand." Soon after the Iron Emperor with his mightiest host darkens the horizon, and Didier falls smitten with terror. The Lombard king is beaten; Ogier is made prisoner while sleeping, and brought to the emperor. He still refuses to be reconciled until the monarch yields Charlot to his revenge. Charlemagne at last gives way; Ogier, when just on the point of striking off the prince's head, abstains, and foregoes his vengeance. Then, returning to his old station as one of the emperor's chief paladins, he fights an invading army and slays their giant leader. He next saves the king of England's daughter Clarice from captivity, marries her, and is recognized as king of that country; but he abandons for a second time the kingly dignity and sets out for the conquest of the Holy Land. Whilst returning to France, he is shipwrecked, comes upon a diamond castle, invisible by day, and finds himself in Avalon in the company of Morgan la Fay. She puts the ring of perpetual youth on his finger, the crown of forgetfulness on his head, and he lives a life of joy for two centuries. Then the crown is taken off; he remembers his old life, and betakes himself to the new and degenerate French kingdom which has succeeded to the empire of Charlemagne. After restoring the spirit of the older knighthood, vanquishing the Norse invaders, and passing through some curious adventures in connexion with his ring, he is carried away by Morgan la Fay and disappears for ever.

Meurvin.—This was a romance of late origin, first printed at Paris in 1531. Meurvin was the son of Ogier by Morgan la Fay, and is a personage of little interest, except for his connexion with the romance of the Knight of the Swan, whose ancestor he is represented to be through his son Orient.

The Four Sons of Aymon; or Regnault de Montauban and his Four Three Brothers.—This, one of the most popular and delightful of sons of the romances of this cycle, was printed many times in the 15th Aymon. and 16th centuries, and in later abridgments as a chap-book.

Adapted from a 13th-century poem, it has been considered as the work of Huon de Villeneuve based upon earlier *chansons*. Aymon de Dordogne, brother of Beuves d'Aigremont and of Girard de Roussillon, brings his four sons to the court of Charlemagne. They are knighted by the emperor, who makes a present of the marvelous steed Bayard to the eldest, Regnault. This is the charger pictorially represented as bearing all the four champions on his back at once. Bertholais, the nephew of Charlemagne, plays one day a game of chess with Regnault, and, losing, petulantly strikes his adversary, who smites him dead with the board. All the four sons of Aymon are compelled to fly and war is immediately declared against them as outlaws, in which their unhappy father, as the feudal vassal of Charlemagne, is obliged to take an active part. Numerous incidents of deadly peril and adventure on both sides are recorded, and Regnault displays so much daring, skill, and magnanimity as to create in the reader's mind a hatred of the ungenerous monarch who relentlessly pursues the brothers. It will be remarked how singularly the character of Charlemagne has deteriorated from the earlier type. The famous Bayard plays a notable part in the story. On one occasion, by the help of his cousin, the enchanter Maugis (son of Charlemagne's assassinated enemy Beuves), Regnault captures the emperor, Roland, Ogier, Naimés of Bavaria, and Turpin. Although they are in his power, the chivalrous knight and his brothers merely kneel to Charlemagne and beg for peace and pardon. The monarch's hatred is implacable; but Regnault nobly sets his captives free, and the war begins again. Regnault, who is lord of Montauban, a castle given him by Yvon, sovereign of Gascony, for having repelled a Saracen invasion, retires from the strife and makes a pilgrimage to Palestine. On his return he goes as a simple mason to aid in the building of Cologne cathedral, and is there slain by the treachery of his fellow-workmen.

Maugis d'Aigremont.—The special romance bearing this title (first printed about 1520) is not the only one in which Maugis the enchanter plays a prominent part. He is originally derived from the 13th-century poem on the four sons of Aymon, to whom he furnished material assistance in the struggle against Charlemagne. He also appears as a comrade and helper of Renaud in the *Conquest of Trebisond*, and again in the romance of *Mabrian* (1530), in which he is elected pope, and finally perishes in a cave to which Charlemagne sets fire. These are all three of late origin; and the *Conquest of Trebisond* (s.a., about 1520) is not even of French composition, but is adapted from the 14th-century Italian poem of *Trabisonda*. The four sons of Aymon, especially Regnault (Tasso's hero Rinaldo), and their kinsman Maugis seem to have been especially dear to the Italian imagination.

Gerard d'Euphrate.—This, printed in 1549, and professedly translated from a metrical Walloon original, is an absurd tale of magic, containing nothing except names to connect it with the ancient poem on Girard de Fratte, one of the vassals who warred against the emperor. Although split into two personages in course of time, Girard de Fratte (not d'Euphrate) and Girard de Roussillon seem to have been originally identical. Girard was one of the sons of Doon of Mayence, and therefore brother to Aymon. Consequently this romance may be placed in connexion with the *Four Sons of Aymon*, and also serves to link it with *Garin de Montglane*, as it is evident that Girard de Vienne in the latter romance is only another form of the older Girard.

Huon of Bordeaux.—This interesting story was compiled in prose in 1454, from a late form of a poem which was current towards the end of the 12th century, and which has often been attributed to the trouvère Huon de Villeneuve, but without reason. Huon, duke of Guienne, one of the paladins of Charlemagne, is on his way to Paris to pay his respects to his liege lord, when he is attacked by the malicious and envious Charlot, whom he kills in self-defence. The emperor grieves so much for his son's death that he dooms the unlucky Huon to death also, notwithstanding the intercession of all the peers and councillors. At last Huon is pardoned, but only on condition that he shall make a journey to the East and bring back from Baghdad a part of the Saracen amir's beard and four of his back teeth, after having slain one of the Saracen lords and kissed the amir's daughter before his face. These impossible tasks he is enabled to accomplish by the help of the pretty dwarf Oberon, who presents him with a magical cup and horn. A loud blast upon the latter suffices to bring Oberon and 100,000 warriors to his aid. At the most critical instant his magic powers fail him, simply because he had been guilty of deceit in announcing himself as a Mohammedan in order to gain entrance. The princess Esclarmonde has, however, fallen in love with him and succours him. He is at length brought out to fight the giant Agrapard, who has invaded Baghdad; he conquers him, and tries to persuade the amir to turn Christian. Again when he is in danger, Oberon saves him; and the teeth and beard are taken from the dead Saracen. Then begins a series of adventures full of peril and distress. Huon overcomes strong temptations practised on his chastity and the deadly straits in which he is placed by Saracen foes and treacherous kinsmen, and at last makes Esclarmonde his lawful wife and justifies

himself before Charlemagne. Oberon always makes his appearance when the needs are sorest, and in fact plays the best part in the narrative. This romance has no connexion with the actual history of Charlemagne; but it is an attractive work of imagination.

Valentin et Orson.—This well-known and charming story, first Valentin in 1489, relates the lives of two brothers exposed in infancy and of whom one is suckled by a bear. After many adventures, Orson, they regain their rightful position and each learns his relationship. The events are supposed to take place in France in the time of Pippin. It is a composition of the 15th century.

Octavien, or Florent et Lyon. is a similar story, never printed in Octavien French, although written in that language, probably in the 15th century, from an episode of the *Reali di Francia*.

Beuve d'Hamstone, or, as he is called in English, Bevis of Hampton, Bevis of is the subject of an old French story which was embodied in the *Hamp-Reali*, and is only connected with Charlemagne by the mention of ton. King Pippin and the hero's kinship with the sons of Aymon. As a French prose romance it was printed by Vêrard about 1500. It had been printed separately in Italian at Bologna in 1480. An old English poem on Bevis was in the 15th or 16th century turned into a prose romance, and was printed about 1560.

Morgant le Géant is only a translation of Pulci's poem *Morgante Maggiore*, and *Guérin Mesquin* is similarly translated from an Italian prose recomposition of an old Italian poem. Little more than the names was derived from the old Charlemagne *chansons de geste*; and the same may be said of the famous poems of Boiardo, Berni, and Ariosto upon Roland (Orlando).

Bibliography of the first printed Prose Romances, including Texts and Translations.—*Reali di Francia*, fol., Modena, 1491. *Pseudo-Turpin chronica*, fol., Frankfurt, 1566 (forming a portion of Schard's *Rerum German. 17. vetustiores chronographi*); *Chronique composée par Turpin*, fol., Paris, 1476 (forming part of the *Chroniques de S. Denis*; first independent edition, Paris, 1527). *Gallien Bethoré*, fol., Paris, Vêrard, 1500. *Pierabras le Géant*, fol., Geneva, 1478—printed also under the title of *Conquête du grand roy Charlemagne*, fol., Lyons, 1486; in English, *Charles the Great*, Caxton, 1485; in Spanish, 1528. *Guérin de Montglane*, fol., Paris, 1518. *Doon de Mayence*, fol., Paris, Vêrard, 1501. *Ogier le Danois*, fol., Paris, Vêrard, c. 1498. *Quatre Fils Aymon*, fol., Lyons, c. 1480; in English, *The Four Sons of Aymon*, fol., Caxton; in Spanish, *Reynaldos de Montauban*, fol., Seville, 1525 (translated from an unprinted Italian version of the *Quatre Fils* and the *Trebisond* united); *Conquête de Trebisond* (Regnault de Montauban), 4to, Paris, c. 1520. *Chronique de Mabrian*, fol., Paris, 1580. *Maugis d'Aigremont*, 4to, Paris, c. 1520. *Beuves d'Antihonne et la belle Josienne*, fol., Paris, Vêrard, c. 1500; in English, *Syr Bevis of Hampton*, 4to, W. Copland, c. 1560. *Roman de Meurvin, fils d'Oger le Danois*, 8vo, Paris, 1531. *Gérard d'Euphrate*, fol., Paris, 1549; *Gérard de Roussillon*, Lyons, c. 1590. *Milles et Amys*, fol., Paris, Vêrard, c. 1508; in Italian, *Milles e Amis*, 4to, Venice, 1508; *Jourdain de Blaves*, fol., Paris, 1520. *Huon de Bordeaux*, fol., Paris, 1516; in English, *Huon of Bordeaux*, Copland, c. 1540. *Valentin et Orson*, fol., Lyons, 1489; in English, *Valentine and Orson*, 4to, ed. (c) Spanish Cycle: *Amadis and Palmerin*.

Arthur had become in Britain not only a national hero Amadis of romance but also a leading figure around whom might of Gaul be grouped the adventures of subordinate knights. Charlemagne filled a similar place for French writers, but had the advantage of being a more distinct historical character than Arthur. In the Iberian peninsula, where we find the next great cycle of stories, the circumstances which produced the national hero (the Cid) were still progressive, and his history was too real to melt into such romantic fiction as dealt in France and England with remote and shadowy paladins and the wonders of fairyland. Therefore, while the Cid had an ever-present reality in ballads, the earliest appearance of prose romance in Spain was in an artificial imitation of the Franco-British cycle. As it was a work of great merit, its fictitious hero became, as it were, the central figure in the stories which followed and which bore to one another a strong family likeness. Most of the chief heroes are illegitimate, like Amadis; the adventures of two brothers are told; and there is much similarity of incident and character. Many of the scenes are laid in Constantinople. *Amadis de Gaula* is the poetical sire of an extraordinary series of romances, which in the words of Cervantes¹ form an "innumerable linaje," and is itself the most interesting and remarkable of them. Although its reputation is due to the Spanish redaction of Montalvo, there was an earlier Portuguese version by Vasco de Lobeira (d. 1403), a gentleman of the court of João I.

¹ Under AMADIS of Gaul (vol. i. p. 650) may be seen the different references in *Don Quixote* to the romance.

At the end of the 16th century a manuscript of this version was in the possession of the dukes of Aveiro at Lisbon, but since the middle of the 18th century all traces of it have been lost. There is, however, reason to believe that the earliest form of the story was in Castilian (c. 1250?), also entirely lost. In a moral poem, *El Rimado de Palacio*, written about 1400, we find Pedro Lopez de Ayala speaking of having wasted his youth with

"Libros de desvaneco e mentiras probadas
Amadis e Lanzarote,"

which is sufficient to prove that *Amadis* existed about the period 1350-60. There is also a reference to Galaor, brother of Amadis, in the chronicle of Ramon Muntaner (1325-28), as well as to Tristan, Lancelot, and "other knights of the Round Table." There are several allusions in the *Cancionero* of Baena (1440-50) to an ancient version, one especially to its being "en tres lybros." The earliest form is likely to have been in verse. The author was well acquainted with the Arthurian legends, and we find a marked imitation of *Tristan* and especially *Lancelot*. Many of the names indicate a Celtic origin: Gaula certainly means Wales and not France, as they who insist upon a French original of the romance would lead us to believe. There still remains much that is entirely novel. In the words of M. Baret, to whom the literary history of this romance owes so much—

"Si, par la tradition primitive, l'*Amadis de Gaule* dérive de la source commune des romans de la Table Ronde, si même il a existé une version Portugaise, c'est néanmoins à l'Espagne que doit demeurer l'honneur d'avoir créé, sur un thème ancien, une composition originale, en introduisant dans un cadre emprunté la nuance particulière de sentiments et l'art nouveau qui donnent à notre roman son importance et sa valeur spéciales" (*De l'Amadis*, p. 21).

Of the primitive *Amadis*, probably in three books, which charmed the youth of Ayala nothing is known. The prose romance we now possess was written about 1465 by Garci-Ordoñez de Montalvo, governor of Medina del Campo, to whom we may assign all traces of a spirit later than the first years of the 14th century, and to whom the whole of the fourth book may be due. This book is more refined and more romantic than the others. One of the chief reasons of the popularity of this version is the happy manner in which the improvement in manners is indicated. For the first time in chivalric romances we find distinct traces of the personality of the writer. The tastes, feelings, and prejudices of Spain towards the end of the 15th century are well expressed, without loss of the high chivalry of an earlier and simple time. It was first printed at Saragossa in 1508.¹ Within the next fifty years thirteen or fourteen more editions issued from the press, and *Amadis* became fully established as the popular hero of Spanish romance. When the Spaniards first saw Mexico in 1519 they were reminded of the enchantments of the story.

Francis I. made acquaintance with the *Amadis* during his Spanish captivity and directed Nicolas de Herberay, seigneur of Essarts, a gentleman of Picardy, to translate it. The first four books of the original work were first printed in French in 1540. De Herberay also translated most of the continuations down to the ninth book. He died about 1552, and Boileau, Gohorry, and others continued the work. Estienne Pasquier, in his *Recherches de la France* (1611), alludes to the popularity of the French *Amadis*, "dans lequel vous pouvez cueillir toutes les belles fleurs de nostre langue Françoise. Jamais livre ne feut embrassé avec tant de faveur que cestuy." De Herberay gives as his reason for the translation, "pour ce qu'il est tout certain qu'il fust premier mis en nostre langue Françoise, estant Amadis Gaulois et non Espagnol. Et qu'ainsi soit, j'en ai trouvé encores quelque reste d'un vieil livre escrit à la main en langage Picard." This contention, which cannot seriously

be held, was insisted upon by M. de Tressan in his abridgment of the *Amadis de Gaule* (1779), wherein a French origin for the first three books is claimed upon the authority of certain MSS. in that language. The commencement of an Italian translation of the *Amadis* romances was printed at Venice in 1546, and the stories became equally popular in that language. Bernardo Tasso, while on a mission to Spain about 1535, read the *Amadis* with delight and afterwards based upon it his poem of *Amadigi di Francia* (1560). He preferred the *Amadis* to all the French romances, not even excepting *Lancelot*. Living at that time, his evidence is extremely valuable. He does not seem to have heard of Lobeira's version nor yet of the French and Portuguese pretensions. In his opinion the story was taken from some ancient British history. The romance was translated into German in 1569 and into Dutch in 1619. Graesse (*Trésor*, vii. p. 30) describes a Hebrew translation of the first four books by Jacob ben Moses Algabbai, printed at Constantinople by Eliezer ben Gerson Soncini, without date. The *Amadis* was first read in English through a version from the French by Anthony Munday (1592). Robert Southey's *Amadis of Gaul* (London, 1803, 4 vols. sm. 8vo) is an excellent translation, in which, however, there are constant signs of editorial pruning. W. S. Rose put the romance into verse from De Herberay's French text (London, 1803, sm. 8vo). Besides the *Amadigi* of Tasso, the romance gave rise to *Amadis*, a drama by Gil Vicente (1521), the Portuguese Plautus, to an opera by Lulli, represented at the Académie Royale de Musique at Paris (1684), to a poem by Wieland (1771), the forerunner of his *Oberon*, and to another by Créuzé de Lesser (1813). The translation of De Herberay had an extraordinary success. It penetrated even to the convents. The Huguenot La Noue and the Catholic Possevin protested against it in vain. The allusions to the *Amadis* and its continuations are endless; for instance,—"La gloire de Nicquée," used for the bracket seat of a coach; the proverbial saying "envoyer chez Guillot le songeur"; "Dariolette," the name for a confidant; "Urgande la desconnue," a phrase with Scarron and La Fontaine; and many more. The romance even furnished Christian names to some noble families, as to the lovely Corisande, countess of Guiche. The festal pageantries in vogue at the court of Charles V. were imitated from it. A poetical title of Queen Elizabeth was "the fair Oriana." Burton refers to the reading of the romance in his *Anatomy of Melancholy* (1621).

The period of *Los Quatro Libros del Cavallero Amadis de Gaula* is supposed to be earlier than that of Arthur or of Charlemagne. The hero is the illegitimate child of Perion, king of Gaul, and of Elisena, princess of Brittany, and is set adrift at sea in a cradle. He is picked up by a Scottish knight, who takes him to his own country; he calls him the Child of the Sea and educates him at the king's court. Having been knighted, Amadis goes to the assistance of his father Perion (the relationship being then unknown), who in the meantime had married Elisena, by whom he had a lawfully begotten son, Galaor. The second child is stolen by a giant. Amadis becomes revealed to his parents through a ring, and consoles them in their new loss. He overthrows the king of Ireland, who had invaded Gaul, and returns to England. The adventures of the two brothers Amadis and Galaor in England, France, Germany, and the East occupy the remainder of the work, which is full of combats between them and other knights, magicians, and giants. While a youth at the Scottish court Amadis met Oriana, daughter of Lisuarte, king of England, who had been sent away from home in consequence of political troubles. The vicissitudes of their love form a marked feature of the tale. At one time the hero, disguised and under the name of Beltenebros,² retires to a hermitage upon receiving a cruel letter from Oriana. After defeating a hundred knights by whom Lisuarte had been attacked, and some further exploits, Amadis has to leave Oriana and the English court owing to the jealous suspicions of the king. He returns to rescue the princess from the Romans, and afterwards carries on a long war with Lisuarte, who is also attacked by a second enemy, Aravigo. In this perplexity Lisuarte is generously assisted by Amadis, who

¹ Until recently bibliographers considered an edition printed at Salamanca in 1519 as the *editio princeps*, although Clemencin and others cited one of 1510, which no one had seen. A most interesting discovery was, however, made at Ferrara in 1872 of an entirely unheard-of edition produced at Saragossa by G. Coci in 1508.

² From the French translation "Le beau ténébreux" comes the popular application of the phrase to taciturn and melancholy lovers. The episode, parodied by Cervantes, is derived from the romance of *Tristan*. Amadis was also known by the names of the Knight of the Sword and the Greek Knight.

slays Aravigo. Lisuarte then consents to the marriage of his daughter with Amadis on the Firm Island, whose wonders are brought to an end by Oriana entering a certain magic chamber,—a feat only to be accomplished by the fairest and most faithful of women.¹

The *Amadis* is one of the best of the romances and contains many passages of much beauty and even tenderness. The boyish attachment between the Child of the Sea and Oriana is well told. The princess is weak and jealous, and not altogether a pleasing character. Amadis is a fine creation and is well distinguished from his brother Galaor. Both are brave, but the elder is grave and the younger gay. Amadis is the type of a constant lover; his brother is more changeful. A modern reader may be wearied by the intolerable length of the *Amadis* and by the continual recurrence of similar adventures all ending in the same way. But these repetitions seemed no fault to readers whose tastes were easily satisfied and to whom such fictions came as an entirely new source of delight.

The continuations are inferior to their prototype and become more full of complicated incidents and strange adventures as they proceed. The characters alter: for instance, the Urganda of the first four books is a fairy like Morgan la Fay, but subsequently she develops into an enchantress of a more Eastern and malignant nature like her rivals Zirfea and Melia. Besides his redaction of the *Amadis*, Montalvo composed about 1485 an original work, about one-third as long, giving the history of a son of the hero, called Esplandian. In order that it might share in the popularity of the father's achievements, it came forth as *Quinto Libro d'Amadis de Gaula, o las Sergas del Cavallero Esplandiano*. The curate justly decreed that "the merits of the father must not be imputed to the son" when he cast the volume on the bonfire in Don Quixote's courtyard. Although perhaps the best of the continuations, it is not equal to the original. We read that before marriage Oriana bore a child to Amadis, and in order to hide her shame the boy is sent to a distant country. While those in charge of him are passing through a forest a lioness carries him off, but a hermit meets and rebukes the animal, which subsequently suckles the young Esplandian. When he grows up the lioness continues her care and accompanies him to the chase. King Lisuarte one day witnesses this, which is the cause of Oriana recognizing her son by certain marks on his body. He is brought up at the court of Lisuarte and receives knighthood. He then begins his adventures under the title of the Black Knight (from his armour), and sails for Turkey, where most of his exploits take place. The Christians are assisted by the enchantress Urganda and the infidels by her rival Melia. Amadis, Galaor, Esplandian, and the knights being in great danger of death, Urganda saves them by putting them all to sleep on the Firm Island until Lisuarte, son of Esplandian, could obtain possession of a certain magic sword. The romance was first printed in 1510, and five editions appeared before the end of the century. This was soon followed by other similar romances, each with an illegitimate descendant of Amadis for a hero, with a son who performs exploits still more wonderful than those of his father,—a perpetual succession of heroes. At the end of the *Esplandian* Montalvo speaks of writing another book to carry on the history still further. This caused some one, believed to be Paez de Ribera, to bring out *El Sexto Libro, en que se cuentan los Grandes Hechos de Florisando*, nephew of Amadis, taken from an Italian source. This was translated into English and Italian, but not into French. The *Septimo Libro, en el qual se trata de los Grandes Hechos en armas de Lisuarte de Grecia y Perion de Gaula*, deals with the life of the son of Esplandian and Leonorina. The other character is Perion, son of Amadis and Oriana, and the type of the fickle lover, as opposed to Lisuarte, who is more like Amadis. The book commences with the voyage of Perion from England to Ireland, but a lady in a boat with a crew of four monkeys separates him from his followers. He goes to Trebizond and falls in love with Gricleria, daughter of the emperor. When Lisuarte is a prisoner in charge of the king of the Giants' Isle, Gradafille, the daughter of the latter, escapes with him to Constantinople, where after many combats he obtains the magic sword and enables Amadis and the knights to escape from the magic sleep in the Firm Island (see *Esplandian* above). Lisuarte eventually marries Onoloria, sister of Gricleria. The work continues *Florisand* and is attributed to Feliciano de Silva. Juan Diaz, the author of *El Octavo Libro, que trata de*

¹ This kind of incident, which is frequently to be found in the subsequent books as a test of chastity, is connected with the kindred story of the ill-fitting cloak in the Arthurian legend. Spenser uses it in the *Faerie Queene* (iii. 12) where,

"The maske of Cupid and th' enchant-ed Chamber are displayed."

Lisuarte de Grecia y de la Muerte del Rey Amadis, pretended that his work was taken from the Greek. It also is a continuation of *Florisand* and was not translated.

We now come to *Libro Noveno, que es la Chronica del Principe y Cavallero de la Ardiente Espada, Amadis de Grecia*, a continuation of the seventh and not of the eighth book, and more full of marvels than any of its predecessors. Amadis of Greece, the son of Lisuarte and Onoloria, is carried off by pirates when an infant and sold to a Moorish king. He derived his name from the figure of a flaming sword upon his breast. The exploits commence, like those in the *Esplandian*, at the Forbidden Mountain, and the family history concludes, as in the same romance, with the enchantment by Zirfea of all the heroes and princesses in the Tower of the Universe in order to prevent their death at a fated moment. Feliciano de Silva is the reputed author. Stimulated by the success of his two anonymous productions, the same writer continued the series with four more parts, of which the *Coronica de los Valientes Caballeros D. Florisel de Niquea y el Fuerte Anaxartes* forms the tenth book and contains the first two parts. Genealogically the romance is a continuation of *Lisuarte* and *Amadis de Grecia*. Florisel is the son of the latter person and the princess of Niquea. In these fictions a new character is introduced, Darnel, a kind of comic shepherd, in love with the heroine Sylvia, daughter of Lisuarte and Onoloria, through whom Florisel becomes acquainted with the heroine. All three go to the relief of Anaxartes, who is confined by enchantment in a fiery prison. But the achievement of the exploit is reserved for the Amazon Alastraxera, whose adventures occupy a great portion of the tale, which culminates in the siege of Constantinople by all the potentates of western Europe in consequence of Florisel having carried off Helena, princess of Apollonia. Among other new characters are the enchantress Armida and the "strong" Anaxartes, who marries young Oriana, sister of Florisel. The amount of bloodshed throughout the work is only equalled by the number of marriages. The third part of *Florisel* forms the eleventh book of *Amadis* and is known as *Chronica de Don Florisel de Niquea, en la qual se trata de D. Rogel de Grecia y el Segundo Agesilao*. Rogel is the son of Florisel and Helena, and brother of Agesilao the Second, so called to distinguish him from Agesilao of Colchos. A few years later Feliciano de Silva published the fourth part of *Don Florisel*, in two books, the second of which treats of the loves of Rogel of Greece and Archisidea, and of Agesilao and Diana, daughter of Queen Sidonia. The author in his preface implies that the work was intended as an allegorical celebration of the military and domestic virtues of Charles V.

The hero of *La Dozena Parte que trata de los grandes Hechos en Armas del Cav. Don Silves de la Selva*, was the son of Amadis of Greece and Finistea. Born on a desert island, Don Silvio first distinguishes himself at the siege of Constantinople described in the tenth book. The Greek empresses and princesses having been carried off by enchantment, he accompanies the knights who go in search of them. The ladies are rescued, but during their absence have become mothers, among others of Spheramond, son of Rogel, and Amadis of Astre, son of Agesilao. Feliciano de Silva sometimes passes for the author, who was really Pedro de Lujan. The work is in two parts, which in French make the thirteenth and fourteenth books. *Lepolemo ó el Caballero de la Cruz* and *Leandro el Bel* are considered to make the thirteenth and fourteenth books. From a unique first edition (1521) of *Lepolemo* discovered a few years since it appears that it professed to be a translation by Alonso de Salazar. The hero was the son of the emperor Maximilian and was carried away in infancy to the East. N. Antonio speaks of a certain romance composed by a Portuguese, entitled *Penalva*, the last of the line of the original Amadis. It is supposed to have dealt with the last exploits and death of Lisuarte of Greece, but if it existed at all no printed copy has ever yet been seen. The other Spanish romances usually appended to the Amadis series are mentioned in the bibliographical list below.

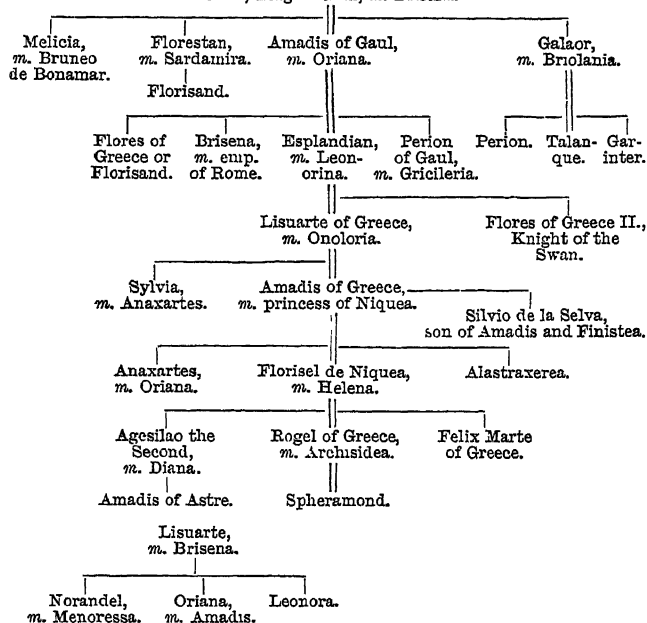

In the French series more and more liberties are taken with the original as the work proceeds. As shown in the table below, the French numbers of the books do not tally. The fifteenth, entirely due to series of Antoine Tyron, describes the feats of Sferamond (so called from continuing a birthmark representing a globe) of Greece and Amadis d'Astre. The sixteenth to the twenty-first books continue the adventures of Sferamond and were translated from the Italian of Mambrino Roseo by Gabriel Chappuys. Duplicate versions from the Italian were made by Nicolas de Montreux of the sixteenth, by Jacques Charlot of the nineteenth, and by Jean Bovion of the twentieth books. The twenty-second to the twenty-fourth books, devoted to Fulgoran, Saframan, and Hercules d'Astre, continue and form a new conclusion of the French *Amadis*. Only one edition appeared (Paris, 1615, 3 vols. 8vo), now extremely rare. The naive and pure style of the earliest of the series degenerates into an uninteresting succession of coarse and obscene incidents. In the twenty-third book we are taken for the first time to America. *Flores de Grèce* (1552) is considered to form the twenty-fifth book. Genealogically it would be the sixth, as the hero is the second son of Esplandian. In the 16th century the French Amadis library extended to 30 vols. of various

sizes. In the 17th century appeared a new work forming, as it were, the preliminary, being the history of the *Chevalier du Soleil* and his Brother *Rosclair*, sons of the emperor Trebatius (Paris, 1620-25, 8 vols.),—not identical with the Spanish *Fébo*. *Belianis de Grèce* (1625) forms one vol., and the *Roman des Romans* (1626-29)—containing the end of the career of the Knight of the Sun, all the Amadis, Flores, and Belianis—forms 8 vols., and finishes this long series of about 50 vols. The *Thresor de tous les Livres d'Amadis* (1559-60, frequently reprinted) is a selection of the speeches, letters, cartels, complaints, &c.; it was translated into English as *The Treasury of Amadis of France* (H. Bynnenman, n.d.; about 1575).

The Italian translation, which is extremely difficult to obtain complete, conforms more closely to the Spanish. The *Sferamundi* romances were first composed in that language by Mambrino Roseo. A perfect set of the German version is also very rare. Some of these volumes were translated by a Protestant, who made changes to suit his religious views, such as altering "mass" to "sermon."

	<i>Roman des Romans</i> (1626-29)
	<i>Penalva</i>

Although the Palmerins have not enjoyed the celebrity of the line of Amadis, they were nevertheless closely allied in dignity and importance, and their histories are written in evident imitation of their distinguished original. At the head of this second great family of Spanish romances stands *El libro del Cavallero Palmerin de Oliva*. From some Latin verses at the end it appears to have been written by a woman, said to have been a carpenter's daughter of Burgos, or a lady of Puente del Arzobispo (Augustobriga), at the beginning of the 16th century. Only one copy is known of the *editio princeps* of Salamanca (1511). The love-scenes are described with more voluptuous detail than is usually to be expected in a female author. But this warmth of colouring may have been one of the causes of the success of the romance. There are many Spanish and Portuguese editions, and it was first translated into French by Jean de Voyer, vicomte de Paulmy, in 1546, into Italian by Mambrino Roseo in 1544, into English by Anthony Munday in 1588, and into Flemish in 1602.

Like most of his compeers, Palmerin was not born in wedlock. He was the son of Griania, daughter of Reymicio, emperor of Byzantium, and of Florendos of Macedon. The infant was exposed on a hill covered with palm trees and olives (whence the name) and was discovered by a peasant, who reared him as his own son. Palmerin's earliest exploit is to save a travelling merchant from a lioness. The grateful traveller furnishes him with arms and a horse, and Palmerin sets forth in quest of adventures, the first of which is to kill a serpent that guards a fountain whose waters are necessary to Primaleon, king of Macedon. He then succours the emperor of Germany, with whose daughter, Polinarda, he falls in love. Like the lady in *Arthur de Bretagne*, she had previously appeared to him in a dream. Norway, England, and Greece are successively the scene of his daring. He delivers from the power of the Grand Turk the princess Agriola, who ultimately marries Trineus, the companion of Palmerin. After many combats, enchantments, and love escapades, the hero at length marries Polinarda and becomes emperor of Byzantium upon the death of Reymicio.

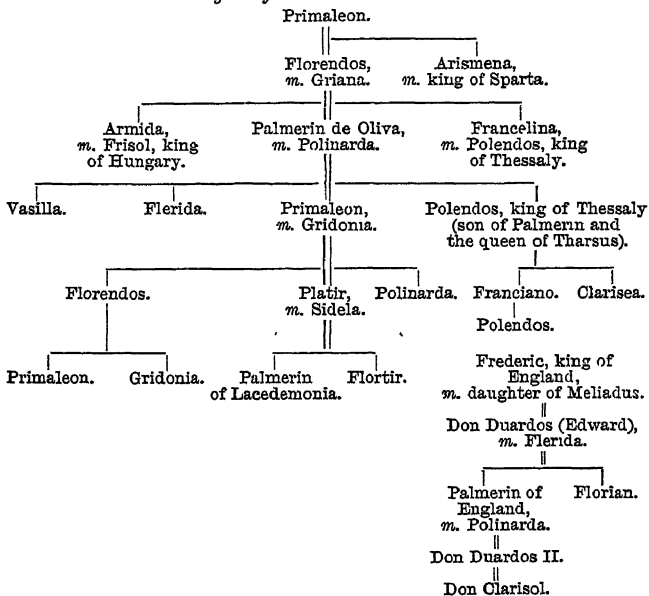

The same fair unknown also produced *Libro Segundo que trata de los Hechos en Armas de Primaleon y Polendos*, both of them sons of Palmerin by different mothers, the first by Polinarda and the second by the queen of Tharsus. While with his mother Polendos one day ill treats an old woman, who mutters that it was not thus that his father treated the helpless. This sets him to look for his sire. He meets with Primaleon and goes to the court of Duardos (Edward) of England. The beautiful Gridonia, daughter of Duke Hormedes, bears two sons to Primaleon, the second of whom is made the hero of the next romance, or third book, *Historia del Cav. Don Polindo* (*Polendo* is the fourth part of the Italian series). The fourth book is *La Cronica del Cav. Platir*, the son of Primaleon and Gridonia, and very properly condemned by the barber. The fifth book consists of *Historia del Cavallier Floritir*, which is only to be found in Italian.

The sixth book, *Libro del Cav. Palmerin de Inglaterra*, was the most serious rival to the popularity of Amadis. Formerly this work was considered to have been first written in Portuguese and was attributed to Francisco Moraes, from the first edition then known in that language, printed at Evora in 1567. The statement of Moraes, now proved to be true, that it was translated from the French (1552), was looked upon merely as a literary device. On the discovery of the original edition in Spanish (Toledo, 1547-48) it was seen that the real author was Luis Hurtado, a Toledo poet. It was translated into French by Jacques Vincent in 1552, and into Italian by Mambrino Roseo in 1554-55. The first Portuguese version was republished at Lisbon in 1786 (3 vols. 4to) under the name of Moraes, and from this Southey edited his revision of Munday's translation (London, 1807, 4 vols. sm. 8vo). Palmerin and Florian are the twin children of Florida (daughter of Palmerin de Oliva) and Duardos, king of England. The mother gives birth to them in a forest and they are taken away by a savage as food for his two lions. Duardos is in the power of an amiable giant, Dramuziando, and Primaleon with a company of knights starts from Constantinople to England in order to relieve him. In the meantime the children are being tended by the wife of the savage and reared with her son Selvian. Florian falls into the hands of

Sir Pridos, son of the duke of Wales, who educates him under the name of the Child of the Desert. Palmerin, his twin brother, meets with Polendos, who takes him and Selvian to Constantinople. Palmerin's first love-affair is with Polinarda, who repulses his affection, and he travels to England under the title of the Knight of Fortune. In the middle of a battle with Florian the brothers are separated by Florida and the secret of their birth divulged by Daliarte, a magician. Their subsequent adventures are beyond enumeration, those of the Perilous Isle being the most interesting. A part of the story relates to the castle of Almourol, where resides the proud Miraguarda, whose peerless beauty is championed by enamoured knights. The giant Dramuziando becomes one of her admirers. In this romance the marriages take place in the middle, giving ample opportunity for many more combats, abductions, ravishments, murders, and other deeds of violence or valour. This is evidently so close an imitation of the *Amadis*, while only second to it in popularity and intrinsic merit, that a comparison between the two naturally arises. As in its prototype, there are two heroes. We have Palmerin, the faithful lover, and Florian, the fickle one, as well as Daliarte, the magician, and the Perilous Isle. The characters are well discriminated: Palmerin is generous, brave, and chivalrous; Florian, witty and courageous. The giant Dramuziando actually excites our sympathy and interest, and the emperor Primaleon is a fine and courtly old gentleman. Much feeling for the beauties of nature is shown; the dialogue is good. On the other hand, the story is not so simple and natural as the original *Amadis*. There are too many knights and battles, and the romance is distinctly inferior as a work of art.

The seventh book consists of *Terceira [e Quarta] Parte de Palmerin de Inglaterra onde se contam os Feitos do Don Duardos Segundo seu Filho*, which continues the Portuguese version of Moraes, to which the two parts are the third and fourth books. It was composed by Diogo Fernandez de Lisboa. The eighth and last book of the Palmerin series are the fifth and sixth parts of the same work, being *Chronica do Famoso Principe Don Clarisol de Bretanha*, by Balth. Gonçalves Lobato. Like the preceding, it was written in Portuguese and not translated.

(d) *Teutonic, Anglo-Danish, &c.*

Outside the four great cycles of mediæval romance there lie some minor cycles, as well as various isolated fictions, to which we must now make reference.

The origins of the Teutonic cycle belong to epic or Teutonic ballad literature, as we find them in the *Wilkinasaga*, in the *Nibelungenlied*, and the *Heldenbuch*. As those works have already been treated separately or in connexion with the national literature to which they belong, we need only make brief allusion to the fact that the Germanic legend of Siegfried (Sigurd, Siegmund, Sigenot) is very ancient, and that the Norse or Icelandic sagas embody its oldest existing form. The High German *Nibelungenlied*, *Hildebrandslied*, *Hadubrand*, *Diétrichsaga* (or *Heldenbuch*), *König Rother*, &c., are probably specifically older than the Norse books, but they contain the legend in a later shape,—the *Heldenbuch* especially deviating from the first two by the introduction of a number of names and incidents arbitrarily adapted from the history of the Gothic, Lombard, Burgundian, and Hunnic wars during the 5th and 6th centuries. There are no prose romances on these themes, but the mythical hero Siegfried, called Horn-Siegfried or Hörnen-Siegfried, gave his name to the French and English stories of *Horn* and *Rimenhild* (Rimenhild being derived from Chrimhild, the wife of Siegfried). Before these last came into existence there had arisen in England a set of legends of which Anlaf Sitricson, the Danish king of Dublin (converted to Christianity 943, deceased on a pilgrimage in 981), was the hero. They were combined in a French poem called *Havelok*, by Geoffrey Gaimar (12th century), the name Havelok being a corruption of Anlaf or Olaf, and reappearing still later in the form of Hamlet. Various trouvères composed ballads of greater length on the same theme, with many additions, and finally others appeared in English. In all of them we find mixed elements, including incidents which connect this Dano-Saxon romance with *Guy of Warwick* and the French *King Horn*.

The fact last mentioned tends to justify the assumption Anglo- of an Anglo-Danish cycle, which may be said to begin with Danish. the poem of *Beowulf*. Between the mythical Siegfried and Beowulf of the early centuries and the fictitious Horn and Guy of the 13th the Anglo-Danish Havelok of the 12th intervened, and furnished material to the trouvères who composed the last two works. In *Horn* and *Rimenhild* there is little more than the names to connect the story with the old Siegfried poem, but much that brings it into contact with Anlaf and Danish or Norse history. Its reappearance in prose as *Pontus et Sidoine* belongs to the second half of the 15th century. *Guy of Warwick*, from whatever actual personage its hero may have been derived, is a purely English story of the 13th century, connected with *Havelok* by its evident relation to legends of Danish wars in England, and with *King Horn* by its embodiment of the most striking incidents of that story,—namely, the return of Guy as a disguised palmer to his own castle, and the use of a ring by which he discloses himself to his wife.

Havelok the Dane appeared first in a French poem by Geoffrey Havelok Gaimar (12th century), and was inserted by him between his *Brut the Dane*, or translation of Geoffrey of Monmouth (now lost) and his *Estorie des Engles*. The story runs that Adelbriht, a Dane, is king of Norfolk, while Edelsi is king in Lindsey. The former marries a sister of the latter, and both die; a girl, Argentille, remains, who is given by her uncle, out of spite, in marriage to a scullion-jongleur, Cuheran. She dreams that her new husband is of superior origin; he confesses that he comes from Grimsby. They both start for this place and discover that Cuheran's putative father, Grim, is dead. It turns out that Cuheran is the son of Gunter, an exiled king of Denmark, and that his real name is Havelok. He and Argentille set out for Denmark, where Edulf, the brother of the usurper, has become king. Sigar, formerly seneschal to Gunter, is lord of the town where Havelok lands and assists him when Argentille is attacked by miscreants. Havelok is made known by his power to

sound Gunter's horn and is saluted as king. He returns to England, fights with Edelsi, and gains the day through Argentille's device of setting up the dead warriors on stakes. When Edelsi dies Havelok and Argentille reign in Lindsey as well as in Norfolk. The tale may have filtered through Welsh channels, as it seems to have gathered British elements before it was taken up by the Anglo-Danes. Argentille (or Argantel) appears to be formed from a Welsh name, which the early English writers converted to Goldborough. The French *chanson* belongs to the early part of the 12th century. It has no direct prose representative. Gaimar's text was first edited by Madden (Roxburghe Club, 1828), in the *Monumenta Hist. Brit.* (1848), and by T. Wright (Caxton Soc., 1850). A French *lai* on the same subject is included in the Roxburghe and in the Caxton volumes; it was issued separately by Francisque Michel in 1833. An English poem is also to be found in the Roxburghe volume, and was likewise edited by W. W. Skeat (Early Eng. Text Soc. 1868).

Guy of Warwick. *Guy of Warwick* is dealt with in vol. xi. p. 341. Besides the many editions of the prose romance, there is an unpublished *Herard d'Ardenne*, sometimes known under the name of its other hero Rembrun, the son of Guy of Warwick, who is found in English metrical versions.

King Horn. *King Horn*.—The primitive English form of the poem is lost, but is represented in the existing *chanson de geste* (*Horn et Rimenild*, 12th century). An early version supplied some of the incidents for Richard of Ely's *Gesta Herewardi Saxonis* (first half of 12th century), which claims to be partly derived from an old book written by Leofric, Hereward's chaplain at Bournemouth. English MSS. (in verse) are preserved at the British Museum, Oxford, and Cambridge. Allof, king of Sudenne, is killed by Saracen (Danish) pirates, who also drive away his wife Godylt and turn their son Horn adrift at sea, with Athulf, Fykenild, and ten other children. They land at Westness (Cornwall) and the children are reared by King Aylmer. Horn is banished for a love passage with the king's daughter, Rymenild, and sails for Ireland under the name of Godmod. He returns with Irish warriors and by himself joins a feast held to celebrate the espousals of Rymenild with a King Mody. Horn, disguised as a pilgrim, drops a ring into Rymenild's cup with the words "Drink to Horn of horn." He defeats Mody and reinstates his mother in Sudenne. Rymenild is carried off by Fykenild, who is ultimately killed by the hero, by whom the lady is rescued. The only copy known of the knightly romance of *Horn Child* and *Maiden Rimenild* is the Auchinleck MS. The story was very popular in Scotland. *Horn* and *Horn Child* have both been printed by Ritson (*Ancient Eng. Metr. Rom.*, 1802, ii., iii.). Francisque Michel has edited *Horn et Rimenild*, including the English and Scottish poems (Bannatyne Club, 1845). The Cambridge MS. was edited by J. R. Lumby for the Early Eng. Text Soc. (1866) and by E. Mätzner in *Altenglische Sprachproben* (1867), and the Oxford text by C. Horstmann in Herrig's *Achiv* (1872).

Ponthus et Sidoine. *Ponthus et la Belle Sidoine*.—In this prose romance the sultan of Babylon sends his three sons to seek their fortune at sea. One of them, Broadas, occupies Galicia and kills King Thibor, whose young son Ponthus with the other children is sent off in a boat to France. They are wrecked off the coast of Brittany, and the story proceeds very much as in the poem of *Horn*. Nearly all the names are changed, however, and there are additional knightly episodes. The romance was first printed at Lyons about 1480. A German translation appeared at Augsburg in 1483, and an English version was printed by Wynkyn de Worde in 1511.

The Anglo-Danish cycle of romance, by reason of its origin and type of adventures, may be fitly supplemented by the stories, eminently English in character, although furnished with an Anglo-Norman setting, which have been called "outlaw romances."

Outlaw romances. Tales of outlaws form a considerable portion of English fiction, and, as elsewhere, the same incidents occur over and over again, being always attributed to the favourite hero of the day. The oldest was that of Hereward the Saxon, whose exploits against William were renowned in prose and verse soon after his own time. Most of the outlaw stories remain in ballad form; a prose example is the French *Fulk Fitzwarin* (about 1320), descriptive of outlaw life in the Welsh marches and other parts of England, Spain, &c.,—an embellished record of actual events from 1201 to 1203. We learn that Payn Peverel, having overcome a devil that tenanted the body of a Cornish giant, Geomagog, who haunts a ruined British village in Shropshire, builds a castle near the place with the assistance of his kinsfolk. A certain Melette Peverel marries Warin de Meez, and their son Fulk Fitzwarin is himself the father

of five sons, who go through scenes many of which are obviously suggested by the Charlemagne *chansons*, such as the fatal chess-board quarrel, the taunting of Ogier by Roland, &c. The five brothers are outlawed and seek adventures. One of their followers, John de Rampayne, resembles Friar Tuck in his skill in playing, singing, and the use of the quarterstaff. The story ends with the submission and pardon of Fulk, the eldest of the brothers, the death of his wife Mahaud, his marriage with Clarice de Auberville, and his subsequent blindness,—all real historical events. It was the first wife of Fulk who became a personage as Maid Marian in the Robin Hood stories and in the plays of Munday and Chettle. The romance was first published by Francisque Michel in 1840, by T. Wright in 1855 (Warton Club), and at the end of *Ralph de Coggeshall* (Rolls Series, 1875).

The exploits of the earlier outlaws, Hereward and Fulk Robin Fitzwarin, reappear under the name of ROBIN HOOD (*q.v.*). The extensive ballad literature relating to the last and his companions Maid Marian, Friar Tuck, Little John, &c., needs only a passing reference. The *Life of Robin Hood*, a prose rendering of the *Geste of Robyn Hode* (Wynkyn de Worde, c. 1495), is reproduced by W. J. Thoms in his *Early Eng. Prose Romances*, 1858.

One of the most popular stories connected with the Robin Hood cycle is *Gamelyn* (c. 1340), sometimes inserted among Chaucer's *Canterbury Tales*. Here three sons are left equal shares in their father's property,—Gamelyn, the youngest, being under the charge of the eldest, John, who neglects him. At the age of sixteen he gains a ram at a wrestling match and invites the spectators home. After the guests retire John and Gamelyn quarrel. The latter is imprisoned, but released by Adam the Spencer, an old servant, and the two escape together. Gamelyn is made king of the outlaws and John becomes sheriff. Gamelyn is captured, but is bailed out by his other brother, Ote. Finally, John is hanged by Gamelyn. The tale was used by T. Lodge for *Rosalynde* (1590) and dramatized by Shakespeare in *As You Like It* (ed. W. W. Skeat, 1884).

(e) Unaffiliated Romances.

The works of this class are of less importance than those which belong to the great cycles; for, indeed, there are few of these last. Amongst the most striking we have *Pierre de Provence et la Belle Maguelonne*, a story of love, adventure, and magic, which existed in Provençal verse at the end of the 12th century, but was first compiled in French prose in 1457 (the text being printed at Lyons about 1478). It was very popular in Spain, and a Spanish translation appeared as a quarto volume at Toledo in 1526.—A similar romance is *Paris et Vienne*, belonging apparently to the first half of the 15th century; the first edition was printed at Antwerp, by Gerard Leeuw, in 1487, five years after the appearance of an Italian translation (Treviso, 1482), and two years after Caxton had issued an English version (Westminster, 1485).—Another French romance (better corresponding to the modern use of the word) is *Jean de Paris* (Paris, c. 1535), written by Pierre de la Sippade (1490-1500). It is a pleasant fiction, full of disguises and surprises like the works of G. P. R. James, and may be compared with *Le petit Jehan de Saintré* (Paris, 1517), written by Antoine de la Sale about 1470, in which we find a true picture of the manners of the French court in the first half of the 15th century.—The *Trois Filz de Roys* is a heavy and dull romance written in Flanders late in the 15th century.—A work of far superior order is *Tirant lo Blanch*, written in the Valencian language in the 15th century by Joannot Martorell. This was printed, with the fourth book added after the author's death, at Valencia in 1490, and has the honour of being the first romance which came from the Spanish press. The author professes to derive his stories from English sources, but he seems to be indebted only to *Guy of Warwick* for some

of his situations and the names of the English localities in which his scenes are laid. Three other Spanish romances may be mentioned here. Though the earliest printed edition of *Oliveros y Artus* is in French, the work (printed in Spanish at Burgos in 1499) is undoubtedly of Spanish origin. It has been popular in all languages. An English version came from the press of Wynkyn de Worde in 1518. *Felix Marte de Hyrcania* (Valladolid, 1556), by Melchor Ortega, is chiefly remarkable as having been read by Dr Samuel Johnson, who is likely to have been the only person since the 16th century capable of such a feat. The *Guerras de Granada* (1595-1619) of Perez de Hita contains some of the finest ballads in the language, and is an interesting and well-written fiction. The first (and best) part deals with the reign of the last Moorish king of Granada, and the second part relates the final ruin of the Moors in Philip III.'s reign.—Another favourite fiction in many lands is that in which a chaste wife is wrongfully accused of infidelity and punished. The character even appears among the earliest ballads of the Charlemagne cycle (*La reine Sibelle*); but here we have to mention three distinct narratives which have attracted generations of readers, and which are widely known from their adoption by many writers. These are *Patient Griseldis* (*Griseldis*), *Genevieve of Brabant*, and *La belle Hélène*. The story in each is similar, and the plot or some of the incidents may be traced in the *Lai del Fresne* of Marie de France (c. 1220), in the Latin legendary history of St Geneviève (written about 1272), in several old monkish lives of St Helena of Constantinople, in the late romances of *Valentine and Orson*, *Florent et Lyon*, and other stories,—the heroine being variously described as the Chaste Empress, the Chaste Queen, or the Chaste Duchess. The most celebrated of these stories is that of *Griseldis*. She is said to have been the wife of Walter, marquis of Saluces or Saluzzo, in the 11th century, and her misfortunes were considered to belong to actual history when they were handled by Boccaccio and Petrarch, although the probability is that Boccaccio borrowed his narrative from a Provençal *fabliau*. He included it in the recitations of the tenth day (*Decamerone*), and must have written it about 1350. Petrarch Latinized it in 1373, and his translation formed the basis of much of the later literature. These works, however, really belong to a different class from that treated here, and may be referred to popular tales, like the narratives which have been repeated in many forms and in many lands from the time of Bidpai downwards. The prose French romance, *La Patience de Griseldis* (Bréhan-Loudéac, 1484), was derived from Petrarch, as also Chaucer's narrative in the *Canterbury Tales*, and the Elizabethan drama in which Dekker was a collaborateur.—The *De Duobus Amantibus* (or *Eurialus and Lucretia*) of Æneas Sylvius is usually included amongst romances, but it is rather an historical novel based upon the imperial court gossip of his own day.—The Spanish *Carcel de Amor*, composed about 1480-90 by Diego de San Pedro, is also a novel; the famous or infamous *Celestina* is a drama of surpassing vigour and interest; and the pastoral romances of *Diana*, *Pastor Fido*, and *Arcadia* belong to a different class from that of mediæval romance.—As much may be said of the English romances produced in the 16th and the earlier part of the 17th century, which are chiefly weak novelistic imitations of the later adjuncts to *Amadis* and *Palmerin*.—The *Seven Champions of Christendom* is a popular tale.—The *Romance of the Fox* (*Reynard the Fox*) and the *Roman de la Rose* likewise belong to totally distinct orders of literature, the former to that of tales (*Volksbücher*) and the latter to the large class of allegorical poems.—The Norman stories of *Robert the Devil* and *Robert of Sicily* are also popular tales.

III. MODERN ROMANCE TO THE 17TH CENTURY.

The inspiration of mediæval romance is gone; but it is necessary briefly to trace its final reflexions to the close of the 17th century, when prose fiction began to assume more definitely the character of the modern novel.

We have seen how large a place in the history of France romances occupied by France down to the end of the 16th century. We first meet with the so-called "pastoral romance" in French in *L'Astrée* (1612) of Honoré d'Urfé, an enormous work inspired by Montemayor, which, however, La Rochefoucauld found interesting. It was frequently reprinted and had many continuations and imitations. Camus de Pontcarré wrote in opposition religious pastorals such as *Palombe*. To the same class belong *Floris et Cléonthe* (1613) by Moulinet du Parc, *Les Bergeries de Vesper* (1618) by G. Coste, *Chrysérionte de Gaule* (1620) by De Sonan, *Le Courtisan Solitaire* (1622) by J. Lourdelot, *Le Mélite* (1624) by L. Videl, *L'Endimion* (1624) by J. Ogier de Gombauld, *Cléomède et Sophonisbe* (1627) by De Gerzan, *Le Berger Extravagant* (1627) by Ch. Sorel, *Anaxandre et Orazie* (1629) by Boisrobert, *Ariane* (1632) and *Roxane* (1639) by J. Des Marets. Le Roy de Gomberville led the way to the new school of French romance in *Polexandre* (1632-39) and *La Cythérée* (1640-42), which were the models for the still more ponderous productions of La Calprenède and De Scudéry. *La jeune Alcidiène* (1651), an unfinished continuation of *Polexandre*, was completed by Mademoiselle M. A. Gomez. These form a link between the genuine romance of chivalry and the so-called heroic style. We still meet with giants and extravagant exploits. The adventures with pirates and the sea scenes show the influence of translations of Greek novels. Madeleine de Scudéry produced her romances under the name of her eccentric brother Georges, but the authorship was well known. The first to appear was *Ibrahim, ou l'Illustre Bassa* (1641); then the work for which she is best known, *Artamène, ou le Grand Cyrus* (10 vols., 1649-53); *Clélie, histoire romaine* (10 vols., 1650-53), contains the famous "carte du pays de Tendre"; then came *Almahide, ou l'Esclave Reyne* (1660), *Les Femmes Illustres* (1665), and *La Promenade de Versailles* (1669). One of the causes of her great popularity was her representation of living characters under flimsy disguise. Keys to *Le Grand Cyrus* have been published. Gauthier de Costes, chevalier de la Calprenède, wrote *Cassandre* (1642-50); *Cléopâtre* (12 vols., 1647-58), the best of his works, which contains the character of Juba satirized by Boileau; *Faramond* (12 vols., 1661-70), continued by Pierre Dortigue de Vau-morière; and *Les Nouvelles* (1661). In spite of their appalling length and their tedious conversations and descriptions, La Calprenède's romances are not without merit. The author has imagination, and his heroes have a share of the noble sentiments of their predecessors. *Bérénice* (1648) by J. R. de Segrain, *La Précieuse* (1656-58) by Mich. de Pure, *Histoire du Temps* (1654) and *Marcarise* (1664), both by Hédelin, and the mystical romances of the Jesuit Ceriziers, belong to the same school. Nearly all the familiar machinery of the old romances is now absent: we no longer meet with dragons, necromancers, giants, and enchanted castles. Formerly love was secondary to heroic achievement; now it becomes the ruling passion, and knightly deeds are performed only to excite the applauding smile of a mistress and not for the sake of military glory. The jargon of gallantry used in these fictions exercised an evil influence upon contemporary literature, until it was laughed out of existence by the *Précieuses Ridicules* of Molière and the dialogue of Boileau on *Les Héros de Roman*. Such works as *Marie Stuart* (1675) by P. Le Pesant de Boisguilbert, *Nouvelles d'Elisabeth* (1680),

and *Frédéric de Sicile* (1680) are a connecting link between the romance of De Scudéry and the modern historical novel.

England. After the invention of printing England produced few original contributions to the literature of chivalric romance. There was a large number of translations of the old French works, and, in addition to these, a rich store of romantic ballads, which formed the customary literature of the people. The yeoman and the outlaw had succeeded the steel-clad knight in public favour. Robin Hood and his merry men appealed to a wider range of sympathies than did Arthur and his companions, and such tales as the *Exploits of Robin Hood*, *Tom a Lincoln*, *George a Green the Pinder of Wakefield*, and *Thomas of Reading* retained their vogue in abbreviated shape as chapbooks down to the end of the 18th century. The stage monopolized the chief forces of imaginative narration during the Elizabethan and Jacobean periods, and the next specimen of a native romance is to be found in the *Euphuës* (1579-80) of John Lyly, who drew largely from Spanish sources. Euphuism gave rise to the *Philotimus* (1583) of Brian Melbanck, to Lodge's *Rosalynde* (1590), to Greene's *Dorastus and Fawnia* (1588), which was the foundation of Shakespeare's *Winter's Tale*, and to *Philomela* (1592) by the same writer. Sir Philip Sidney's *The Countess of Pembroke's Arcadia*, which appeared in 1590, after the author's death, is the most brilliant prose fiction in English of the century, and a genuine pastoral and heroic romance. We should not forget *Parismus, Prince of Bohemia* (1598), based upon Palmerin de Oliva, and *Ornatus and Artesia* (1607), both by Emanuel Ford; *Pheander, a Maiden Knight* (1595), by Henry Roberts; and *The Miseries of Malvillia* (1606), by Breton. Such compilations as Painter's *Palace of Pleasure* (1566), Whetstone's *Heptameron* (1582), *Westward for Smelts* (1620), and Goulart's *Admirable Histories* (1607) are composed of translations or imitations of Italian and French tales. Boccaccio, Giraldi Cinthio, Apuleius, Heliodorus, and Montemayor appeared in English in the latter half of the 16th century, and to the laborious Munday we owe versions of *Amadis* (1592) and *Palmerin of England* (1602) through the French. In the 17th century La Calprenède, Scudéry, Gombauld, and other romancists were translated, and Mrs. Behn, Lee, Lord Orrery, Settle, Banks, and Dryden adapted their works for the stage. Barclay's *Argenis*, a politico-heroic romance with characters representative of real and historical personages, first came out in Latin in 1622; Bishop Hall's *Mundus alter et idem* (1607) is an imitation of Rabelais. *Eliana* (1661) is a caricature of all the absurdities of the contemporary French school. The last of the English romances is the *Parthenissa* (1665) of Roger Boyle, earl of Orrery, which, although prolix and incongruous, has literary merit and a certain narrative interest.

Other European countries.

The last of the Spanish romances is *Polisisme de Boecia* (1602) by Juan de Silva. They received their death-blow in Spain at the hands of *Don Quixote* in 1605, and even those of the greatest merit and popularity almost entirely ceased to be reprinted after that date. Although the pastoral romance of *Diana* (1560) by Montemayor does not really belong to the present subject, it should be mentioned as forming a distinct school of fiction with a family of successors scarcely less numerous than the lineage of *Amadis*. It was continued by Gil Polo, and in it, as in the *Galatea* (1584) of Cervantes, figure real persons and incidents. The earliest representative of the picaresque tale is to be found in *Lazarillo de Tormes* (1554).

The heroic romance never became thoroughly naturalized in Portugal, and the narrative class chiefly found its way through Spain. The romancists Rodriguez Lobo, Eloi de Sá Sotomayor, and Pires de Rebello may be mentioned. The *Menina e Moça* (1554) of Bernardim Ribeiro is the earliest specimen of the pastoral style in the Portuguese language.

Although the *Pastoralia* of Longus is to be considered as the

remote prototype of the modern works, *Arcadia* (1502), the Italian poem of Sannazaro, undoubtedly influenced the *Diana* of Montemayor, and through it inspired the *Arcadia* of Sir Philip Sidney. A few translations and weak imitations of foreign romances were printed in Italy in the 16th and 17th centuries, but *novelle* or short tales formed the staple of the national prose fiction during that period.

French romance—translations of *Amadis* in the 16th and the writings of Mademoiselle de Scudéry and her compeers in the 17th century—exercised a supreme influence in Germany, where the pastoral romance was represented by innumerable "Schäferien." *Herikules und Valisca* (1659) of A. H. Bucholz is a specimen of the voluminous and tiresome heroic romance of the period. *Simplicissimus* (1669) by Hans Jakob von Grimmelshausen, in which the hero traverses the scenes of the Thirty Years' War, is less a romance than the first national novel. C. W. Hagdorn's *Acquan, oder der grosse Mogul* (1670) is an adaptation of La Calprenède's *Cassandre*, and E. W. Happel's *Der insulanische Mandorell* (1682) is a kind of foreshadowing of *Robinson Crusoe*. Two of the most admired fictions of the time were the *Asiatische Banise* (1688) of H. Anselm von Ziegler and Klipphausen and the *Arminius und Thunselda* (1689) of D. K. von Lohenstein. Historical tales and love stories were the chief favourites at the end of the 17th and "Robinsonaden" or imitations of Defoe in the second quarter of the 18th century.

In Holland the French heroic school was mirrored in the works of Johan van Heemskerck, Hendrik Zoeteboom, and Lambertus Bos, published in the middle of the 17th century.

GENERAL LITERATURE OF MEDIEVAL ROMANCE.—Modern critical editions of the *chansons* and romances invariably contain literary introductions. Most of these have been already referred to. For the general history of the subject, see [Bp. R. Hurd] *Letters on Chivalry and Romance*, 1762; Clara Reeve, *The Progress of Romance*, Colchester, 1785, 2 vols.; J. Moore, "View of the Commencement and Progress of Romance" (preface to *Works of T. Smollett*, 1797, 8 vols.); J. Ritson, "Diss. on Romances and Minstrelsy" (vol. i. of *Ancient Metr. Rom.*, 1802, 8 vols.); W. J. Thoms, *Coll. of Early English Prose Romances*, London, 1828, 8 vols., new ed. 1858; T. Warton, "Origin of Romantic Fiction in Europe" (*History of Eng. Poetry*, London, 1840, 8 vols.); G. Ellis, *Specimens of Early Eng. Metr. Romances*, new ed. by Halliwell, 1848, 8vo; J. Dunlop, *History of Fiction*, 1816, 3 vols., and London, 1845, roy. 8vo, still the best general history of the subject, and not very much improved in the German translation by F. Liebrecht, Berlin, 1851, roy. 8vo; J. Nigroni, *Diss. de lectione libb. amatoriorum*, Louvain, 1624; Langlois (Fancan), *Le tombeau des romans*, 1626; P. D. Huet, *De l'origine des romans*, 1711; *Histoire littéraire de la France*, 1793-1831, 28 vols. 4to; [N. Lenglet Dufresnoy], *De l'usage des romans, avec une bibl. des romans*, Amsterdam, 1784, 2 vols. 12mo, and *l'Histoire justifiée contre les romans*, Amsterdam, 1795; [Jacquin], *Entretiens sur les romans*, 1765; [Boucher de la Richardeville], *Lettre sur les romans*, 1762; Lacurne de St. Palaye, "Mém. concernant la lecture des anciens romans" (*Hist. et Mém. de l'Acad. des Inscri.*, vol. xvii.); J. Chapelain, *De la lecture des vieux romans*, ed. Feillet, 1870; *Bibliothèque universelle des romans*, 1775-89, 112 vols. 12mo, containing analyses of most of the romances, over 40 vols. being edited by De Paulmy, the remainder by Le Grand d'Aussy, Tressan, &c.,—the new edition by Bastide (Paris, 1782, 4to) stopped in the middle of the third volume; *Nouvelle Bibliothèque*, 1798-1805, 56 vols. 12mo; De Paulmy and Contant d'Orville, *Mélanges tirés d'une grande bibliothèque*, 1779-88, 69 vols. 8vo.—Le Grand d'Aussy helped in this work, which contains many analyses and a bibliography; Tressan, *Corps d'extraits de romans de chevalerie*, 1782, 4 vols. 12mo; C. de Caylus, "Sur l'origine de l'ancienne chevalerie et des anciens romans" (*Hist. et Mém. de l'Acad. des Inscri.*, vol. xxiii.); L. Dutenes, *Tables généalogiques des héros de romans*, 1796, 4to; J. Michelet, "Sur les épopées du Moyen Âge" (in *Rev. des D. M.*, July 1831); A. P. Paris, *Reponse à M. Michelet*, 1831; J. J. Ampère, *Histoire littéraire de la France*, 1839-40, 3 vols.; A. Ch. Gidel, *Étude sur la littérature grecque moderne et nos romans de chevalerie*, 1846; A. P. Paris, "Romans" (*Lacroix, Le Moyen Âge et la Renaissance*, vol. ii., 1849); E. du Ménil, *Poésies populaires latines antérieures au XIIe siècle*, 1848; L. Gautier, *Hist. des proses jusqu'à la fin du XIIe siècle*, 1858; A. Maury, *Croyances et légendes de l'antiquité*, 1863; L. Moland, *Origines littéraires de la France*, 1868; A. Delvan, *Coll. de romans de chevalerie*, 1899, 4 vols. (abridgements); Fr. H. von der Hagen, *Heldenbilder aus d. Sagenkreisen*, Breslau, 1823, 3 vols.; J. G. T. Graesse, *Die grossen Sagenkreise des Mittelalters*, Dresden, 1842, bibliographical and literary, but showing extraordinary industry and grasp of the materials; F. Diez, *Altromanische Sprachdenkmäler*, Bonn, 1846; O. L. B. Wolff, *Allg. Geschichte des Romans*, Jena, 1850; F. W. Val. Schmidt, *Les romans en prose des cycles de la Table Ronde et de Charlemagne*, trans. by F. de Roisin, St Omer, 1845; K. Goedeke, *Deutsche Dichtung im Mittelalter*, Dresden, 1871; F. Henrion, *Storia de' Romanzi di Cavalleria*, Florence, 1794; G. Ferrario, *Storia ed Analisi degli Antichi Romanzi d'Italia*, Milan, 1828-29, 4 vols. 8vo; A. de Gubernatis, *Storia della Letteratura* (ix.-x., Romanzo), 2 vols. sm. 8vo, 1888; see also numerous articles in *Jahrbücher für romanische u. engl. Literatur*, *Anglia*, *Revue Celtique*, *Romania*, *Revue des langues romanes*, &c.

ARTHURIAN CYCLE.—Lady Ch. Guest, *The Mabinogion*, 1838-50, 3 vols.; Th. Hersart de la Villemarqué, *Contes pop. de la Bretagne* (1846, 2 vols.), *Les Bardes Bretons* (1860), *Les Romans de la Table Ronde* (1861), and *Myrthynion, ou l'Enchanter Merlin* (1862); San Marte (A. Schulz), *Die Sagen von Merlin* (Halle, 1853), and *Parceval-Studien* (Berlin, 1861-62, 3 pts.); [F. Zambivini], *Dell' illustre Historia di Lancillotto del Lago*, Bologna, 1862; "La Tavola Ritonda, o l'Historia di Tristano" (Acad. Bologna, R. Com., 1863); E. F. Leith, *The Legend of Tristan*, 1868; A. P. Paris, *Les romans de la Table Ronde*, 1868-77, 5 vols.; Skene, *Four Anc. Books of Wales*, 1868, 2 vols.; J. S. Stuart-Glennie, *Arthurian Localities*, 1869; F. G. Bergmann, *The Sagen Real*, 1870; G. E. R., *The Story of Merlin and Vivien*, [1879]; E. F. F. Hucher, *Sur les représentations de Tristan et d'Yseult dans les monuments*, 1871, and *Le Saint Graal*, Le Mans, 1874-77, 3 vols.; W. B. Odgers, *King Arthur and the Arthurian Romances*, [1872]; A. Birch-Hirschfeld, *Die Sage vom Graal*, Leipzig, 1877; C. Domanig, *Parceval-Studien*, 1878; L. Kraussold, *Die Sage vom Heil. Graal*, 1878; E. Martin, *Zur Gralsage*, 1880.

CHARLEMAGNE CYCLE.—J. C. v. Aretin, *Älteste Sage über die Geburt . . . Karls d. Gr.*, Munich, 1803; L. Uhland, "Ueber das altfranzösische Epos" (in *Fouqué's Museen*, 1812, pt. 8); E. W. Val. Schmidt, *Ueber die italienischen Heldensagen aus d. Sagenkreis Karls des Gr.*, Berlin, 1820; E. Aignan, *Romances tirés des antennes hist. des 12 Pairs* (vol. iii. of *Bibliothèque étrangère*, Paris, 1829); *Romans des douze pairs de France*, Paris, 1832-42, 9 vols.; A. P. Paris, "Sur les romans des douze pairs" (pref. to *Berte aux grans piés*, 1832).

and "Examen du système de M. Fauriel" (prefixed to *Roman de Garin le Loherain*, Paris, 1833, 2 vols. 12mo); Fauriel, "De l'origine de l'épopée cheval. du moyen âge" (*Rev. des Deux Mondes*, 1832, vols. vii. and viii.); F. Guessard, *Les anciens poètes de la France*, 1859 sq.; Charlemagne romances (prose and verse), pub. by Early Eng. Text Soc., pts. 1-10, 1879-84; K. Bartsch, *Ueber Karl Meinet*, Nuremberg, 1861; G. Paris, *De pseudo-Turpino*, Paris, 1865, and *Histoire poétique de Charlemagne*, Paris, 1865; L. Gautier, *Les épopées françaises*, 2d ed., 1878 sq., 4 vols.

SPANISH CYCLE.—For the literary history, see E. Baret, *De l'Amadis de Gaule et de son influence*, 2d ed. 1873; L. Braunsfels, *Krit. Versuch über den Roman Amadis von Gallien*, 1876; A. Fagès, *La bibliothèque de Don Quichotte: A. de Gaule*, 1893; P. de Gayangos, *Libros de Caballerías [Amadis y Esplandian]*, con un discurso preliminar y un catálogo razonado, Madrid, 1857, an able and useful work; F. A. de Varnhagen, *La Litteratura dos Livros de Cavallarias*, Vienna, 1872; Sir W. Scott, "Amadis of Gaul" (*Edinb. Rev.*, October 1808); prefaces to Southey's trans. of *Amadis of Gaul*, 1803, 4 vols., and of *Palmerin of England*, 1807, 4 vols. For the bibliography, see Barbosa Machado, *Bibliotheca Lusitana*, Lisbon, 1741-59, 4 vols. folio; N. Antonio, *Bibliotheca Hispana*, Madrid, 1738-88, 4 vols. folio; article by Salva in the *Repertorio Americano*, August 1827, pp. 29-39; articles in the *Wiener Jahrbücher*, xxvi., xxix., xxxi., xxxiii., lix.; G. Brunet, "Étude sur les romans de chevalerie espagnols" (*Bull. du Bibliophile*, April, May, June, 1861); P. Salva y Mallen, *Cat. de la Biblioteca de Salva*, Valencia, 1862, 2 vols.; B. J. Gallardo, *Ensayo de una Biblioteca Española*, Madrid, 1862-66, 2 vols.; D. Hidalgo, *Diccionario General*, Madrid, 1862-79, 6 vols. In the first volume of A. J. Duffield's trans. of *Don Quixote*, 1881, may be seen a long list of the Spanish romances. See also J. Ormsby, "The Spanish Romances of Chivalry" (trans. of *Don Quixote*, 1885, vol. iv.).

TEUTONIC, DANO-ENGLISH, &c.—See F. J. Mone, *Untersuchungen zur deutschen Heldensage*, Quedlinburg, 1836, 8vo; F. H. von der Hagen, *Minnesinger*, Leipzig, 1838, 4 vols. 4to, and *Gesammtabenteuer*, Stuttgart, 1850, 3 vols.; H. A. Keller, *Römvart*, Mannheim, 1844; G. Gervinus, *Gesch. der deutschen Dichtung*, Leipzig, 1871-74, 5 vols.; K. Goedeke, *Deutsche Dichtung im Mittelalter*, Dresden, 1871, 8vo; A. Bossert, *La litt. allemande au Moyen Âge et les origines de l'épopée ger-*

manique, Paris, 1871; A. Nusch, *Zur Vergleichung des Nibelungenliedes mit der Ilias*, Spire, 1868; Stolte, *Der Nibelungen-Nôt verglichen mit der Ilias*, Rietberg, 1869; M. Türk, *Zur Vergleichung, &c.*, Cronstadt, 1873; O. Schade, "Homer u. d. Nibelungen" (*Wissenschaftl. Monatsbl.*, iii., 1875); A. G. Richey, "The Homeric Question and the Teutonic Epics" (*Hermathena*, 1876); J. Zupitza, *Zur Literaturgeschichte des Guy v. Warwick*, Vienna, 1873; A. Tanner, *Die Sage von Guy von Warwick*, 1877; T. Wissmann, "King Horn" (*Brink u. Scherer's Quellen*, No. 16, 1876); R. Brede, "Ueber die Handschriften der Chanson de Horn" (*E. M. Stengel's Ausgaben*, 1883, pt. 3); F. Ludorff, *Ueber die Sprache des Havelok le Dancois*, 1874, 8vo.

MODERN ROMANCE.—For general works see the separate articles on the great European literatures. The following are some special treatises:—*Bibliothek der Romane*, Riga, 1782, 21 vols.; J. Schmidt, *Geschichte der Romantik*, Leipzig, 1848, 2 vols.; J. v. Eichendorff, *Der deutsche Roman des XVIIIten Jahrh.*, Leipzig, 1851; Cholevius, *Die bedeutendsten deutschen Romane des XVIIIten Jahrh.*, Leipzig, 1866; F. Bobertag, *Geschichte des Romans in Deutschland*, Breslau, 1876-79; H. Körting, *Geschichte des französischen Romans im XVIIIten Jahrh.*, Leipzig, 1885, pt. 1; D. Masson, *British Novelists and their Styles*, Cambridge, 1859; B. Tuckerman, *History of English Prose Fiction*, New York, 1882.

BIBLIOGRAPHY.—It has been impossible to do more than indicate the dates and places of the first printed editions of the romances. More full information is to be sought for in J. C. Brunet, *Manuel du libraire*, 1860-65, 6 vols., *Supplément* by P. Deschamps and G. Brunet, 1878-80, 2 vols.; J. G. T. Graesse, *Trésor de livres rares et précieux*, Dresden, 1859-69, 7 vols. 4to; G. Brunet, *La France littéraire au XVe siècle*, Paris, 1865; A. Firmin-Didot, *Essai de classification des romans de chevalerie*, 1870, an admirable and careful work; J. Ames and W. Herbert, *Typ. Antiquities*, London, 1785-90, 3 vols. 4to; W. T. Lowndes, *Bibliographer's Manual*, ed. H. G. Bohn, London, 1857-64, 6 vols.; W. Blades, *Life of W. Caxton*, London, 1861-63, 2 vols. 4to; B. Quaritch, *Catalogue of Romances of Chivalry*, 1882; G. Melzi, *Bibliografia dei romanzi e poemetti cav. italiani*, extended by P. A. Tosi, Milan, 1865, 12mo, first published as supplement to Ferrario, *Storia*; P. Paris, *Les MSS. français de la Bibl. du Roi*, 1855-48, 7 vols., with many extracts and accounts of romances; H. L. D. Ward, *Catalogue of Romances in the Department of MSS. in the British Museum*, vol. i., London, 1883, a most valuable and scholarly essay, and the most important work yet published on romance. (H. R. T.—M. K.)

ROMANCE LANGUAGES is the name generally adopted for the modern languages descended from the old Roman or Latin tongue, acted upon by inner decay or growth, by dialectic variety, and by outward influence, more or less marked, of all the foreign nations with which it came into contact. During the Middle Ages the old Roman empire or the Latin-speaking world was called Romania, its inhabitants Romani (adj. *Romanicus*), and its speech Romanicium, Vulgar Romanio, Italian Romanzo, from *Romanice loqui*=to speak Romance; in Old French nominative *romanz*, objective *roman(t)*, Modern French *roman*, "a novel," originally a composition in the vulgar tongue. In English some moderns use Romanic (like Germanic, Teutonic) instead of Romance; some say Neo-Latin, which is frequently used by Romance-speaking scholars. By successive changes Latin, a synthetical language, rich in inflexions, was transformed into several cognate analytical tongues of few inflexions, most of the old forms being replaced by separate form-words. As the literary language of the ancient Roman civilization died out, seemingly extinguished by the barbarism of the Middle Ages, all the forms of the old classical language being confounded in the most hopeless chaos, suddenly new, vigorous, and beautiful tongues sprang forth, ruled by the most regular laws, related to, yet different from, Latin. How was this wonderful change brought about? How can chaos produce regularity? The explanation of this mystery has been given by Diez, the great founder of Romance philology. The Romance languages did not spring from literary classical Latin, but from popular Latin, which, like every living speech, had its own laws, not subject to the changing literary fashions, but only to the slow process of phonetic change and dialectic variety. It is wonderful how like the very oldest archaic Latin is to the youngest, Modern Romance. A great number of old sounds, forms, and expressions, which were discarded or disused by classical Latin, reappear in late vulgar Latin, and live on in the modern languages. Here especially the words of Horace 'come true:

"Multa renascentur, quae jam cadere, cadentque
Quae nunc sunt in honore vocabula, si volet usus,
Quem penes arbitrium est et jus et norma loquendi."

The present article, embracing all the Romance languages, dwells chiefly on their common origin and formation. Much of their general history has been treated under

LATIN; only some points, especially phonetic, which need a fuller discussion, are taken up again here.

We will now briefly review the fate of popular Latin through its successive stages, showing everywhere the earliest appearance of the germs of Modern Romance.

I. First (Pre-Classical) Period: to c. 80 B.C. (Cicero).

Latin, like all other literary languages, began as a living Latin popular speech. There was during this first period practically little difference between the vulgar and the literary language. In the oldest historical time Latin was spoken only in the small territory called Latium. The greater part of Italy proper was occupied by the Umbro-Oscan tribes, whose languages were Italic, related to Latin, yet so different as to be unintelligible to the Romans. The two most distinct types were Umbrian in the north and Oscan in the south. The chief difference between them is that Umbrian was in a much more advanced state of phonetic decay, and was in many respects a precursor of Italian and Romance, while Oscan was still more antique than Latin. When the territories where these dialects were spoken became subject to the Romans, about the beginning of the 3d century B.C., the language of the conquerors was introduced, but of course modified by the speech of the conquered. Thus two groups of provincial dialects¹ were formed. (1) The North or Umbrian and Sabellian Latin, with which Etruscan Latin was closely connected, was peculiarly important, since it spread southwards and extended to the neighbourhood of Rome; thus Falerii, Praeneste, and Tusculum spoke it. Later it spread to Northern Italy. Being really a fuller development of the tendencies of the old popular Latin and easier to pronounce than literary Latin, at last from the surrounding peasantry it reached the people of Rome and became the source of the modern tongues. (2) The South or Oscan Latin was Latin with some slight phonetic modifications,

¹ The Latin dialects have been investigated by K. Sittl, *Die lokalen Verschiedenheiten der lateinischen Sprache*, Erlangen, 1882. On Latin sounds generally see Seelmann, *Die Aussprache des Latein*, Heilbronn, 1885. Both these books, however, must be used with caution. Sittl has the merit of having traced the relations of North Latin, but has many rash assertions; see *Zeitschr. f. rom. Phil.*, vi. 608 sq. Seelmann is superior to Corssen as a phonetician, but is often obscure and given to elaborating strange theories. Thus he arrives at the absurd conclusion that the differences of quantity did not exist in the classical age, but that the poets judged of quantity by the close or open sound of the vowel.

which, in Modern South Italian, have lived through the levelling influence of the north dialect. Between the Umbrians and the Oscans lay the Sabellians, occupying linguistically as geographically a middle position, yet somewhat nearer to the north dialect than to the south. To the west of Umbria lay the mysterious Etruria, whose language, preserved in numerous inscriptions, has long been an unsolved riddle and is still a matter of dispute, some considering it as utterly unconnected with Italic or even Aryan, some, as Deecke and Sophus Bugge, thinking it Aryan, intermediate between Greek and Italic, but partly decayed. In the last respect it has much in common with Umbrian, but its tendency to a rapid and slovenly utterance is still more distinctly traceable than in Umbrian.

Of the other languages spoken in old Italy, such as Messapian, Celtic, Venetian, and Ligurian, too little is known to enable us to form an estimate of their phonetic character; but in general we see the peculiarities of North Latin penetrating more or less everywhere, in the north of Italy and in Spain (subjected at the end of the 3d century B.C.), as well as in Gaul, of which the southern part, Provincia (later Provence), was subjected first, and the rest, by Cæsar, in the 1st century B.C. All these countries were rapidly Latinized; but the provincial dialects did not always follow the phonetic development of the mother speech, just as American does not always follow the changes of English.

Old Popular Latin.

Consonants.

A. Phonetics. 1. Final consonants, especially *s*, *m*, partly *t*, *d*, *r*, were feebly pronounced and often dropped in writing: *s* in nominatives, as *Cornelio* (T. Scip.),¹—even Ennius wrote *certissimū nuntius mortis*; gen. aedem *Serapi* (in a law); acc. *viro* nostros (Plaut.). In verse *s* was not counted in the metre till the manhood of Cicero, who, though he had himself followed the earlier use in his youth, calls it “subrusticum,” which shows that it continued in the country. This agrees with Umbrian, where *s* was often dropped, as *Ikuvinu*² *Iguvini* (nom. plur.), *agre agri* (gen.), &c.; with North Latin, as *matrona Pisaurense* (nom. plur.; at Pisaurum); *maximo maximus, senatus* (gen. at Falerii) = Old Lat. *senatus*; *militare* (nom.; at Tusculum) looks quite Italian. *M* was often dropped, as in the well-known *homo oino duonoro optumo fuisse viro* (T. Scip.). It was, by the express statement of Quintilian, obscurely pronounced (see *LATIN*), and must have been very loosely articulated, the lips probably only approaching, not closing, much like Polish *Dąbrowski* (Dombrowski), which gives a sound between a feeble *m* and a nasal vowel. In Umbrian, this dropping of the *m* is frequent, as *poplo* for *populum*, and in Faliscan *sacru, datu*. *T*, on the contrary, was generally retained in Old Latin, but frequently dropped in Umbrian, as *dēde dedit, habē habet, habia habeat*; likewise in North Latin, as *dēde dedit, dedro* and *dedrot* for *dederunt* (T. Pis.); *dēde* (Tibur); *cupa* and *cupat* for *cupat* (Fal.). Sometimes *d* was used, as *fecid* (Præneste), in Osc. *fejacid, deded*. In the perfects, however, *d* is perhaps the older sound. *D* is the final consonant that was first dropped, as in *in altod marid* (Col. Rostr.), a *Gnaivod patre*, but also *longā vitā* (T. Scip.), later frequently. *Pate(r)*, *soro(r)*, *colo(r)*, occur in Plautus with *r* dropped or slightly pronounced (not counted in the metre); in *pate(r)* venit (Terence; see *LATIN*); in Fal. *uxo, mate*; in Æquian *uxo*; and in Ital. *frate, suora, moglie*. *N* was dropped in *tame(n)* suspicor (Ter.); Umb. *nome* and *numem*, pointing perhaps to a weak nasal vowel; Ital. *nome*.

2. *D* after vowels sometimes became *r*, as *ar ad, arvorum* adversum, *arvise, arger agger*,—rustic *ar me advenias* (Plaut., *Truc.*, ii. 2); it was retained in classical Latin in *arbitr, arcesso, meridies*. In Old Umbrian *d* constantly changes to a peculiar sound, here transcribed *q*, in Later Umbrian spelt *rs*, as *ad, ars ad, peturpursus* quadrupedibus, *dupursus* bipedibus. This sound appears to be only a less trilled variety of the Roman sound. In some few instances this old *r* reappears later, as in Mediaeval Lat. *armesariius* (Lex Salica), in Roum. *armesariu*, Ital. *argine*, Ven. *arzare*, Span. *arzen* = Lat. *arger* (agger). In Modern South Italian *r* for *d* is quite common, as Neap. *rurece*, Sicil. *durici* = Ital. *dòdici*, Lat. *duodecim*.

¹ There is nothing to prove that this *s* was voiced, like Eng. *s*; probably it was voiceless and weakly articulated, much the same as in Andalusian *lo(h) padre*, for Span. *los padres*, “the parents.”

² Abbreviations—*T. Scip.*, Tituli (Elogia) Scipionum; *Col. Rostr.*, Columna Rostrata; *Broch.*, Epistola Consulum de Bacchanalibus; *T. Pis.*, Tituli Pisaurenses; *L. Lat.*, Low or Late Latin; * before a word means hypothetical.

³ Spaced letters signify the inscriptions in the national characters, generally supposed to be older; italics mean the inscriptions in Roman letters, supposed to be younger.

3. *Z* for *s* is found in some unintelligible fragments of the *Carmen Saliare*, mentioned by Varro (*L.L.*, vii. 26), but in the text he says that the ancients used *s* for *r*. *Coz(ano)*, but also *Cosano*, is found on two old coins from Cosa, though here *z* may be due to Oscan influence. On the other hand, *veter, quivquir*, were found in the ancient augural books, perhaps Etruscan Latin(?). But the ordinary form of Old Latin was *s*, as in *asa, honos, honosis, flosem, lases, Fusius, Papisius, Valesius*. Not *z*, but *s* or *ss* was used to render Greek *z*;—*Saguntum, commissor, massa*; in this last word (Fr. *masse*) the present pronunciation still testifies to the old voiceless sound. Thus the whole theory of the ancient Latin *z* becomes somewhat doubtful; yet it is probable that it existed in the oldest prehistoric Latin, and that forms like **asum resum* were pronounced with *z*, like the Osc. *eizazunc egmazum* (same meaning). Later on *s* (*z*) passed into *r*, following in this the Umb. *urnasiaru, pracatarum, &c.* In most words Latin now got *r*, even in some where Umbrian retained *s*; comp. Lat. *ara* with Umb. *asa*, Lat. *plenarius, ordinarius* with Umb. *plenasier, urnasier*. In Lat. *nasus*—nares the relation must be somewhat like that in A.S. *cebsan, ceds*—*curon, gecoren* (choose, chose, chosen), probably owing to an original difference of accent. In many cases where Latin retained *s* it was originally double, as in *caussa, cassus* (=cad-tus), thus spelt by Cicero and Virgil (Quint., i. 7, 20); *formonsus* and *formossus*; this is the reason why Italian has always *s* hard (voiceless) in *cosa* (Ven. *cossa*), *doloroso, &c.*, as Ascoli has shown. Thus, every *z* or voiced *s* having passed into *r*, the sound *z* must have disappeared from the language, and it was only much later that it was reintroduced. The sound of *z* seems to be especially at home on Celtic ground; the voiceless sound still exists in the south of Italy (Rome, Naples, Sicily) and of Spain. The English pronunciation of Latin words like *morose, jocosae*, and of Greek words like *dosis, crisis*, is probably due to ancient tradition.

4. *N* was often dropped before *s*, as *cosol* consol, *cesor* censor, Nasals. *cosentiont* (T. Scip.), *mo(n)strare, Mostellaria* (Plaut.); even *festram* for *fenestram* (*fen'stram*; Ennius); *Alliesis* dies dicebatur (Fest.); *meses* (inscr. Neap.), &c.; nearly always *formossus, formosus* for *formonsus* (see 3). This agrees with Umb. *Eikvasese* and N. Lat. *Pisaurense, Pomp. castresis, pesa*, and reappears in Ital. *Milanesse, Genovese, mese, pesare*, Fr. *mois, peser*. In Latin *n* generally did not quite disappear, but was feebly pronounced, very like French *n* in *penser*, or probably still more like the Polish nasal vowel in *miesz*, “flesh,” *gęs*, “goose,” half vowel, half consonant. By this partial absorption of *n* the preceding vowel was lengthened, *cōsol*. Cicero expressly mentions *insanus*, Gellius *pēnsio*, the grammarians *mēns, mēns, gēns*. The same was the case before *f*, as *infelicia* mentioned by Cicero; *n* sometimes dropped before *v*, *coventionid* (Bacch., 187 B.C.); comp. Umb. *kuveitu* convehito, *kuvertu* convertito, Fr. *covent*, Eng. *covent, covenant*. *N* is rarely dropped before *t* and *d* except in N. Lat. *dedrot* (T. Pis.); but this does not count, as the *t* was mute. Cicero testifies to *indoctus*, which proves the full sound of *n*. The spellings *tamtæ, sententiam, damda, tuendam, &c.*, of the Lex Julia (45 B.C.) are probably only analogical from *eumdem, eandem, &c.*, pronounced *n*. *M* disappears in *Poponi, Seproni*, but perhaps only apparently, as Priscian tells us that medial *m*, as in *umbra*, had a middling force, not the obscure sound of final *m*. In most old spellings, as in the Scandinavian Runes, we frequently find nasals dropped before corresponding “mutes” or stops, where there is no suspicion of an obscured sound, e.g., in Run. *LAT* for *land* the nasal is simply understood. Likewise in Umbrian the older *ustetu* is shown by the Latin spelling to mean *ostendu, &c.* In Modern Romance only Celtic districts have produced nasal vowels.

5. *H* is sometimes dropped from the 2d century B.C. downwards—“*Parcissime ea [H littera] veteres usi etiam in vocalibus, quum oedos [read aedos] ircosque dicebant*” (Quint., i. 5, 20); “in Latio rure *edus*, in urbe *aedus*” (Varro), for *haedus* = Goth. *gaits*, “goat”; likewise *olera, asta* (Varro); in Marsian Lat. *Irtius* for *Hirtius, Ostilius*; comp. Umb. *eretu* = *heritu* “velit.” *H* must have had a rather feeble sound, something like French *h aspirée*.

6. *Rs* is found assimilated in *russum* (*rūsum*), *sussum* (*sūsum*), &c., in MSS. of Plautus and Cato, and in some inscriptions, always in *prosa* (but *prorsus*) and *cena*, Umb. *gersnatur* “*cenati*,” *dosuarius* (Varro); “*sic et dossum per duo s . . . quidam ut levius enuntiaverunt*” (Vel. Long.). Comp. Umb. *Tursce, Tuscum* “*Tuscum*”; Ligurian Lat. *suso* (bronze tablet near Genoa, 117 B.C.). But this assimilation was never carried out consistently; we have L. Lat. *susum et jusum* (sursum et deorsum), Ital. *su e giù*, older *suso e giuso*; *dosso*, but *corso, verso, orso* (ursus), Fr. *ours*, Span. *oso*.

7. *I* was doubled between vowels, as in “*antiqui maiius*,” which Priscian distinctly explains to have been pronounced with the sound of *i* consonant (Eng. *y* in *you*), and “*Pompeii* ut si dicas *Pompeii*.” Cicero spelt *aio, Maiiam*; “*quod si est, etiam jungetur [i] ut consonans*” (Quint., i. 4, 11). Comp. also Osc. *Pompaiians*. Out of the older and popular *majius, peijus* grew Ital. *maggio, peggio*, whereas classical Latin had *majus, pejus*. For *filius* = *filjus*, see 23 below, p. 664.

8. *V* occurs in Old Lat. *verplovere* perpluere (comp. *pluvia*),

conflorent (comp. *florom*; *fluvidus*, Lucretius), *sovo*, *suvo*, *suo*, *ingenuvae*, *cloracae*. Comp. Umb. *tover* and *tuer*, *tui*; Osc. *suuad*, &c. It reappears in Petronius, *urceatim plovebat*, and in Ital. *pidvere*, *rovina*, *vedova*, *Genova*, *Mantova*, *chiavica*, Span. *llover*, Fr. *plevoir*.

9. In *qu* the *u* after *q* was only a lip glide, defined by the grammarians as "neither vowel nor consonant," as it did not count in the metre. It was therefore easily dropped altogether, as in *Cinti* for *Quincti* in an old inscription. This was especially peculiar to Etruscan Latin, as in the very old *Aecetia* Aequitiae, *Tarcna*, Etrus. *Tarxnas*, Tarquinius. Instances occur later everywhere, as *cocus* for *coquus*, *cottidie* (Lex Julia), &c.; L. Lat. *cinque*, *cinquaginta* (Edict. Diocl., 301); Ital. *chi* qui, *che* quid, *cudere* coquere, *cucina*=vulg. Lat. *coquina* (=culina), *cinque*, &c. But generally Italian retains *qu* with the old sound, *quinto*, *quanto*, Span. *cuan*to, but *que*, *quinto* (=k), Fr. *qu*=k.

10. The Old Romans, having no aspirates in their own speech, could not pronounce the Greek ϕ , χ , θ , but generally turned them into *p*, *c*, *t*, as *Pilippus* Φίλιππος, *Prune* Φρίνη, *colapus*, *Bacanal*. In some words the old popular pronunciation continued later, as class. *anpulla*, *purpura*; Silver Age, *percolapant* (Petron.); Mediæval, *colopus*, *colpus*, Ital. *colpo*, Fr. *coup*; *spaera*, Old Ital. *spera* (Dante), Early Eng. *spere* (Chaucer), vulg. Eng. *spear*, "sphere"; *Josepus*, Ital. *Giuseppe*; *Stepanus*, Span. *Estéban*, Slav. *Stepan*.

11. Greek initial π was often rendered β , as *Burrus* Πυρρὸς, also adj., "burrum antiqui quod nunc dicimus rufum" (Fest.); hence, through *bur(r)us*, Ital. *bujo*, "dark"; likewise *buzzis* πυγῆς, Ital. *busso*, *bosso*, Fr. *buis*, "box tree"; from *pygῆs*, class. *pyxis*, popular and L. Lat. *buzzis*, *buzida*, Fr. *botte*.

12. Fafter vowels is rare in Latin, but frequent in Umbro-Oscan, as Umb. *prufe* probe, Osc. *amprufid* improbe, *Safinim* Samnium ("Sabini"), corresponding in cognate words to Greek aspirates where Latin commonly had β : Lat. *vafēr*, "sly," orig. "varius"; comp. *vabrum* "varium" (Gloss. Isid.), Umb. *vufur*. The relation between Lat. *rufus*, Umb. *rofu* and Lat. *ruber* is very like that between *nasus* and *nares*, or that between *veho* and *lingo*, *ligurio* as representing Gr. χ . We may suppose that *f* is the older and stronger common Italic form, sometimes retained in old popular Latin speech, partly by provincial influence. We find *sifilare* for *sibilare* mentioned as archaic by Nonius, as vulgar in the appendix to Probus, Ital. *zufolare*, Fr. *siffler*. *F* is preserved in many provincial names, as *Safinim* (Petron.) and *Tiferum*, Ital. *Tiferno*. We find this *f* again in the Italian *tafano* tabanus, *bafolo* bubalus, Eng. buffalo. The Neapolitan *atrufē*, "October," has a very Oscan appearance.

13. Old Latin often prefers short *e*, especially original and unaccented, to *i*, as in *dedet*, *fuet* (T. Scip.), *cepet*, *refecet* (Col. Rost.), *velet* (Bacch.), *Conditios* (inscr.), *acetare*=*agetare* (Fest.), *dubenus* dominus (Fest.), *componeto* (Cato), *genetrix*, *mereto*, *calecare* (inscr.), *famelia*, *magister* (Quint.). It stands for radical *i*, mostly orig. *e*, as in *en*, *endo*=Gr. $\epsilon\nu$, *semul* (Plaut.)—comp. Ital. *insieme*, Fr. *ensemble*; *Menerva* (inscr., and mentioned by Quintilian). Sometimes it stands even for original *i*, as *tempestatibus*, *audiles* (T. Scip.), *navebos*, *navaled*, but *marid* (Col. Rost.), *sei ques*, *si quis* (Bacch.). This is quite Umbrian; comp. *kanetu* canito, *urfetam* orbitam, *fratreks* "fratrics," *facefele*=L. Lat. *facibilis*, Old Fr. *feasible* feasible, *famedias* familiae (nom. plur.), *kvestretie* quaestura, formed like Lat. *segnities*. In North Latin we find Etrus. Lat. *Aecetia* Aequitiae; Umb. Lat. *Publece*, *menesterium*, (T. Pis.) *Apoleni*, *dede*, *Nome(lia)*; Mars. *dedet*, *mereto*; and rustic "rustici etiam nunc quoque viam *veham* appellant" (Varro). *E*, being more subject to be obscured than *i*, is not unfrequently dropped, as in *cante* for **canete*, class. *canite* (Carm. Sali.), *Nuntioria* (inscr. c. 290 B.C.), *oinvorsei* (Bacch.), *unversum* (Lucretius), *caldus* (Cato), *ardus*, *frigidaria* (Lucilius); always *fert*, *ferte*=*fépère*. Popular Latin here approached the North dialect, where such syncopes were constant: comp. Umb. *nomne* nomine, *termnu* termino, *postro* postero; they were still more violent in Etruscan, as *Elysentre* Alexander, *Sehtmnal* Septimienā nata, *Tarxnas* Tarquinius; Pis. Lat. *dedit* dederunt, *Lebro* Liberum; Umb. Lat. *cedre* *cedere*, &c. South Latin, on the contrary, favoured *i* (see below).

14. Of long *i* Lucilius distinguishes two kinds—close (*i* tenue), as in *pila*, "mortar," and open (*i* pingue), approaching to *e*, written *ei*, as in *peilum*, "spear," *meilia*, "thousands"; he might have added *feilius*, "son," comp. *fēlare*, $\phi\lambda\chi\lambda\epsilon$. There was an original diphthong *ei*, as in *deicere*, Osc. *deicum*, Gr. $\delta\epsilon\iota\kappa\nu\iota\alpha\iota$, which was early contracted into this middle sound, exactly like Eng. *ey* in *money* from Old Fr. *monete*. This too is quite Umbrian, spelt *ei* and *ee*, *e*, as *enetu* inito, Arch. Lat. *eneito*, *feliuf* filios, *screltor*, *screhto* scripti, *preve* privus, *Ioveine*=*Iovine*, *Iguvini*; comp. the datives *Iuve patre*, *mehe*, *tefe* (tibi), Osc. *Divele*, *paterel*; also Umb. Lat. *fel*=*filius*, and Pis. *Lebro*. In North Latin datives in *e* are generally constant (*Apoleni*, Pis., uncontracted), as *Iunone matre*, *Iove*, *patre*, *Marte*, &c., extending sometimes even farther south; and Gallo-Lat. *nise* (Lex Rubr. de Gall. Cisalp.). Livy used *sibe* and

quase (originally *-ei*). This exactly agrees with the rustic pronunciation *vella*, *spēca* recorded by Varro, *lēber* by Festus—"ab antiquis et *ameci* et *amecae* per *e* litteram efferebantur" (Fest.). And this again surprisingly agrees with the Modern Emilian (Romagnuolo) pronunciation, as Bolognese *mēga* mica, *dēg* dico, *mēll* mille, plur. *mēla*=Ital. *mila*, *vēla* vita, *maré* marito, *prēm* primo. Thus this old rustic sound seems to have extended northwards, but later to have been driven from its old home by the classic close *i*, which penetrated everywhere else, and is generally represented in all the Romance languages.

15. Old Latin often prefers short *o*, especially original and unaccented, to *u*, as in *consol* (T. Scip.), *tabola* (Bacch.), *pocolom* (many old inscr.), *populum* (Tab. Bantina), *epistola*= $\epsilon\pi\iota\sigma\tau\omicron\lambda\eta$, *Patricoles*, *Hercoles*, *colpa* (Prisc.), *Volcanom* (inscr. 3d century B.C.), *volgo* and *volt*, &c. (Plaut.); *o* after *v* continued in the classical age), *soni* sunt, *cosentioni* (T. Scip.), *denontiani* (Tab. Bant.); in terminations—*Venos*, *opos*, *robore*, *filios*, and *Luciom*, &c. (T. Scip.); in Umb. acc. *poplo*, *salvo*, *tertio*; even for orig. *u*=*asariato* *est*, *observatum* ibi; radical—*molita* multa, "fine," *onse* (h)umero, Ital. *omero*, Span. *ombro*, *somo* summo (orig. sup-mo), Ital. *sommo*; in North Latin *moltaticod* (T. Picen.); in Fal. *maxomo*, *zenatru*; and in Ligurian Latin *florim*, *infumo*, *suso* (bronze tablet near Genoa, 117 B.C.). *O* reappears in Late Latin and Italian *mollo*, *dolce*, &c. Medial *o* is often dropped before *l*, as in *omni poplo* (Plaut. Pseud.), *teglarius* (inscr.), *Fostilus* (Faustulus, 114 B.C.), *Hercle* (Plaut.), *singulariter* (Lucr.)—comp. Fr. *sanglier*, Ital. *cinghiale*=*coplata* (Lucr.); in some cases, as *poculum*, *periculum*, the contraction does not appear till the empire; at Pompeii *anglata*, *subla*, &c. As Umbrian always has contraction, *piacdom*, *anglom*, *Treblanir*, *villu*, *kathu*, *stiplo*, whilst Oscan distinguishes diminutive forms like *zicolum*, *ziceli*, *ziculud* from such forms as *sakaraklom*, *pestlom*, the strongest impulse must have come from the north, although there must have been a pretty general tendency to syncope everywhere. In Italian contraction is the rule in popular words, as *vecchio* for *vetulus*, Late *veclus*, *occhio* *oculus*, &c. In *popolo*, *tavola*, *isola*, &c., and diminutives like *ritolo* and *gondola*, the original vowel has remained throughout. South Latin favoured *u* (see below).

16. The use of *o* for *e* after *v* is shown by Old Lat. *oinvorsei*, *vortere*; in *vostrum* (Plaut., Ambrosian palimpsest), the original sound (from *vos*) occurs, which must have been universal in popular speech, since it reappears in Late Latin and all the Romance languages—Ital. *vostro*, Fr. *votre*, &c. There was a tradition that Scipio Africanus had been the first to spell these words with *e* (Quint., i. 7, 25). Here Umbrian distinguished between *e* and *o*, as in *vestra*, *covertu* (pres.), but *covortus* (perf.); Lat. *vorsare* is perhaps Span. *vosar*, *bosar*, "to vomit"; in other words *e* is now universal.

17. *U* occurred for *i* before labials; but the old *optumo* has scarcely left any trace, yet Ital. has *menomo* besides *minimo*. Later *u* was pronounced with the sound of *ū*, Gr. *u*, Fr. *u*, which at last was turned into *i*, as in *optimus*, Ital. *ottimo*. But in some few words the old popular form has survived—*stupula*, Ital. *stoppia*, Fr. *étouffe*, "stubble," *dissupare*, Ital. *sciupare*.

18. *U* stands for *o*—"Fruandes, fontes vetustissimi; quae tamen a primoribus repudiata sunt, quasi rustico more dicta" (Prisc.)—contrary to the general rule (see 15). Spellings like *muns*, *muntem*, *funtem* abound in Late Latin, as *munificer* (already in 93 A.D.), Σεντομοννριϋ (Plut., c. 100); whence Old Fr. and Old Eng. *mun*, "mount," Ital. *monte*, *ponte*, *fente* with close *o*. In Siennese we have even *pognere*, *ponto*, Ital. and Florentine *pugnere*, *punto* (pungere, punctum); the connexion, however, of *o* with Old Latin *u* is doubtful.

19. Greek *u* was pronounced *u*, as in *Bruges* Φρύγες, *Burrus*, *purpura*, *gubernum*, *gubermare*, *cupressus*,—the last four also classical; otherwise the classical age adopted the Greek sound *y*, as in *Cyprus*. In popular Latin the old sound remained, and *u* was sometimes (before *r*, as in *fore*) even changed into *o*, as in *vorax* (Ter.), *ancora* (Nævius). In Low Latin *u* is frequent: *cuprum*, "copper," for which Pliny used *Cyprum* (aes); comp. *bursa*, Ital. *borsa*, Fr. *bourse*, *crupla*, Ital. *grötta*, *tumba*, Ital. *tomba*, &c.

In popular Latin there was a general tendency to contract the Diphthongs, in accordance with Umbrian and North Latin. thongs.

20. *Au* in North Latin began very early to be contracted into long open *o*, as *Pola* (inscr. Picen., 218 B.C.). In Umbrian this is a constant law—*ote* aut, Ital. *ò*, Umb. *toru* tauros, Ital. *toro*, &c. The only form of the oldest Roman Latin was *au*, as *Taurasia*, (*Pavilla* (T. Scip.), *Claudi* (Bacch.). When the Umbrian poet whose provincial name was Plot(u)s settled in Rome in the latter half of the 3d century B.C. his name was Latinized into Plautus. Meanwhile the North Latin *ò* began to penetrate into Latium as rustic, vulgar, and familiar; Cato and Varro often use it in their books *De Re Rustica*, as *coles* (Cato), *colis*, *orata* (Varro): "*Orata* genus piscis appellatur a colore auri, quod rustici *orum* dicebant, ut *auriculas*, *oriculas*" (Fest.). But in the classical age there was a good deal of reaction against this vulgarism, and there is a well-known anecdote of Mestrius Florus warning the emperor Vespasian against saying *plostra*, and being next day facetiously greeted by the emperor as *Flaurus* (Suet., *Vesp.*, 22). At Pompeii

copo took the place of *carupo*, *o(p)scultat* of *auscultat*. It is scarcely possible to fix the precise period at which *o* for *au* became general with the upper classes; but, as it was never changed into *u* like the original open *o*, the general contraction of *au* is probably later than that of *ae* to *è*, which was accomplished about the time of the introduction of Christianity. That the contracted sound is open *o*, not closed, may be inferred from the Italian *ò* in *oro*, *toro*, *cosa*, *povero*, in Old French *chôse*, *pôvre*, as is shown by the rhymes, only in Mod. Fr. *chôse*, *pôvre* (etymologically spelt *parvre*). The Eng. *cause*, *sauce*, *poverty*, have kept the Old French sound; and the Spanish forms are *cosa*, *oro*, *pobre*. The old diphthongal pronunciation of *au* was never quite lost, but preserved in literary tradition all through the Middle Ages, as in Italian and Spanish literary words like *causa*. It even appears to have been popular in some Roman provinces, judging from the Prov. *paubre*, *causa*, in Mod. Prov. *còuso* (spelt by the French "coouso"), and the Portug. *ouro*, *cousa* (also *ôiro*, *coisa*). Even Fr. *chose*, *chor* presuppose *causa*, *caulis*, not *cosa*, *colis*. In Italian, words like *cavolo*, "cabbage," *Paolo*, "Paul," are rare exceptions. It is to be especially noted that *cauda* seems to be false, *côda* being the correct Latin form, which is corroborated by Ital. *côda* with close *o*. Some philologists, however, think *ô* is the old contraction, unconnected with *o*.

21. *æ*, oldest form *ai*, occurs very early, as in *æc*, *prædæd* (Col. Rostr.), and was general at the time of the Gracchi. The difference between *ai* and *æ* is really very slight, the sound of *i* being open, which is very near "raised *e*" (both vowels occur in Eng. *pity*). The pronunciation must have been essentially the same as in the Osc. *ai*, which in the Latin transcription of the Tab. Bantina wavers between *ai* and *æ*. The contraction of *æ* into *è* first occurs in the north, where it was constant, for example Umb. *kræstur*, *præ*, *mæstro* *magistra*, dat. *asæ* *aræ*; North Latin—Fal. *præ(or)*, *Cesilia*; T. Pis. *Cesula*; Etrus. Lat. *Quecili* (= *Cecili* for *Cæcili*), *Cnevia* *Gnaevia*, *Gnaeja*, &c. From the north it spread to Latium, where it first occurs as a rustic pronunciation scoffed at by Lucilius, as quoted by Varro: "Rustici Pappum *Mesium*, non *Maesium*, a quo Lucilius scribit—*Cecilius* *Prætor* ne rusticus fiat." "In *Latio* rure *edrus*, in urbe *aedrus*" (Varro). We find *e* for *æ* quite commonly used in the vulgar dialect of the 1st century A.D.—at Pompeii *letus*, *queres*, *elate*, *presto*, *tabule*, *que*. In Rome *e* became the pronunciation of the upper classes only in the Christian period, 3d and 4th centuries, as *Emiliano*, *phæleæ*=*filiae* (inscr. 3d century), *Cesar* (4th century). Servius (4th century) says "è is pronounced almost like *æ*," that is, with the same sound, only shorter (at least in theory), *æquus* like *æquus*.

22. In Old Latin compound words often did not soften their radical vowel; the preposition being then an adverb, and each word having a distinct stress, the compound was separable, as in manum *endojactio* (XII. Tables)=*in*jactio; *ob vos* *sacro*, *vos* *obsecro*, and *sub vos* *placo*, *vos* *supplico*, in ancient prayers; *transque* *dato*= "et tradito," in ancient laws. This was imitated by classic poets (tmesis)—*inque* *ligatus* (Virg.). Only some of these separable compounds continued later on, such as the intensifying *per*, in *per* *eastor* *scitus* (Ter.), *nobis* *ista* *sunt* *pergrata* *perque* *juvunda* (Cic., *De Or.*), *per* *mihi* *mirum* *visum* *est* (Cic., *ib.*), *Platon* *per* *fuit* *familiaris* (Gellius). Instances of the unchanged vowel in verbs—*æquid* *placeant*, *mè* *rogas*? *immo* *vero* *hercle* *pérplaceant* (Plaut.), and *ea* *mihi* *perplaceat* (Cic.), to which correspond exactly the Old Fr. *par est* *bons*, *par me* *plais*. While the older Latin accentuation was *affatim*, *admodum*, these words seem at the time of Gellius to have been pronounced *affitum*, *admodum*. We have here a first step towards the modern system of accenting the last element of compounds; comp. the modern Comasco *ammò*, Roum. *amù*, "just now." *Quomodo* is continued in Ital. *come*, but is formed anew in the dialectic *comòdo*, *cmòd*. In Late Latin and Romance the old system reappears unimpaired; many of the old compounds, having been lost in popular speech, were formed anew with stress on the last element and unchanged vowel: for instance, class. *displacet*, vulg. *displacet*, Ital. *dispiace*, Span. *despiace*, Fr. *déplait*; class. *accidit*, vulg. *accidet*, Ital. *accade* (inf. *accadere*); *religo* becomes Ital. *rilleggo*, &c.

23. Stress, which in Old Latin was often farther from the end than in classical Latin, seems early to have become pretty strong, so as to induce the voice to hurry over unaccented syllables even though they were long by position (see LATIN), as *magistratus*, *ministerium*, *voluntate*, in Plautus, where *st*, *nt* were pronounced as quickly as in Eng. *voluntary*, *magistrate*. The vowels, too, were hurried over; that *fenestra* was pronounced as *fen'stra* is corroborated by the Ennian *festra*=*fe'stra*,—comp. Ital. *meshtiero*=*ministerium*. Scansions like *sagittis*, *sinillumae* show that double consonants might count as long or short; position was not regarded so nicely as in Greek till the classical age. The real reason may have been the stress on the first syllable. In accented syllables double consonants cannot have been really short, considering the full length of Italian double consonants in *bello*, *anno*, *saetta*, &c. Likewise final vowels of iambic words were shortened, as *novo*, *habe*, *puta*, *bene*, *homo* (see LATIN). This is important, as marking the first step towards the Romance levelling of the old quantities.

This tendency, too, was carefully restrained during the classical age, but reappears early in the post-classical period. Another effect of the strong popular stress is the pronunciation of *i* before vowels as a consonant; thus words like *filius* in Plautus often count as two syllables, *filjus* (*j*=Eng. *y*). This is evidently the preparatory stage to the Romance *figlio*, &c., with palatal *l*,—*l* and *j* having been fused into one sound. This pronunciation, too, was carefully suppressed by the classics.

B. *Vocabulary*.—We append, in chronological order, a brief Vocabulary of archaic words, disused, vulgar, colloquial, or used with lary. a disparaging sense, in the classical age, but reappearing later as quite usual and dignified expressions. The many modern derivatives should be noticed.

LIVIVS ANDRONICUS (c. 240 B.C.): *sortus* surrectus, Ital. *sorto*, *sortire*, Fr. *sortir* de l'eau. PLAUTUS (254-184): *bucca*, "mouth" (fam. Cic.), *bucca panis* (Petron.), Ital. *bocca*, Fr. *bouche*; *minacia*, "threats," Ital. *minaccia*, Fr. *menace*; *calceolarius*, "shoemaker," Ital. *calzolaio*. Diminutives—*vidulus*, *vid'ulus*, "wallet," Ital. *valigia* (**vid'litia*, Diez), Fr. *valise*; *auricula*, Ital. *orecchia*, Fr. *oreille*; *apicula*, Fr. *abeille*; *lusciniola*, Ital. *usignuolo*, *rosignuolo*, Fr. *rossignol*; *sororcula*, Ital. *sirocchia*, commonly *sorella*; *vitellus*, Ital. *vitello*, Fr. *veau*, Eng. *veal*; *agneillus*, Ital. *agnello*, Fr. *agneau*; *putillus*, "little boy," Ital. *putello* (*putus* fam. for *puer*, Virg.). Adjectives—*bellus* (later fam. Cic.)—the Romance *bello* has quite superseded *pulcher*; *minutus*, "small," popul. *minutus* (Petron.)=Fr. *le menu* *peuple*; *ricalis*, originally a law term, figuratively of a rival in love (class. *aemulus*; fam. Cic.); *ebriacus*, "drunk," Ital. *ubbrico*; *sucidus*, "juicy," "dirty," Ital. *sucido*, *súdicio*, Span. *súcio*. Verbs—*ambulare*, "walk," "go," familiar in all ages, hence according to Dr. Vilh. Thomsen the Romance *andare*, *aller*, Roum. *umbla*, Ladino *amnar*; *baulare*, "carry," *bajulus*, "carrier," L. Lat. "educator," Ital. *bálio*, "steward," *bália*, "nurse," Fr. *bailler*, "reach," "give"; *manducare*, "glutton," *manducare*, "chew," "eat," frequent in Old Latin—the emperor Augustus wrote familiarly *manducavi* *duas* *bucoas*=Ital. *mangiai* *due* *bocconi*—in the Vulgate *manducat* *et* *bibit*, Ital. *mangiare*, Fr. *manger*; *auscultare*, "listen" (once Cic., *mihi auscultat*), Ital. *ascoltare*, Span. *escuchar*, Fr. *écouter*; *cantare*, frequent in Old and classical Latin, the only word in Romance (*canere* has been lost); *adjuvare*, Ital. *ajutare*, Fr. *aider* (*adjuvare* lost); *eradicare*, *eradicare*, Ital. *sradicare*, Fr. *arracher*; *mendicare*, Ital. *mendicare*, Fr. *mendier*; *batuere*, *battuere*, "strike," Ital. *battere*, Fr. *battre* (*bátto* from *battuo*), L. Lat. *battualia*, Ital. *battaglia*, Fr. *bataille*; *mutire*, "mutter"—palam *mutire*, "speak" (Ennius)—L. Lat. subst. *mutum* nullum *emiseris*, "not a word," Ital. motto, Fr. *mot*; *sapere*, "understand"—sometimes very near to the modern sense, *sapit* *scelesta* *multum* (Plaut.)=Ital. *la* *scellerata* *sa* *molto*, nullam *rem* *sapis*=Ital. *non* *sai* *nulla*=Ital. *sapere*, Span. *saber*, Fr. *savoir*; *comedere*, "eat" (Cic. fam.), *comedere* *numos*=Fr. *manger* *son* *argent*, Span. *comér*; *despoliare* (Cic., *Ep.*; Liv. once), Ital. *spogliare*, Fr. *dépouiller*; *comparare*, "to procure," later "to buy" (Suet.), Ital. *comprare*. Greek words—*colaphus* (*colapus*), "buffet," "box on the ear" (fam. Quint., Plin.), *percolopabant* (Petron.), L. Lat. *colpus*, Ital. *colpo*, Fr. *coup*. ENNIUS (239-169): *civitas*, "city" (reappears in Petronius and later), Ital. *città*, Fr. *cité*, Eng. *city*; *campasare*, "double (a cape)," a *ἀπαλ* *λεγόμενον*, recognized by Diez in the Ital. (*s)camasare*, "to avoid"; *nitidare*, Ital. *nettare*; *petra*, "rock," frequent in Pliny and later—in the Vulgate *tu es Petrus*, *et* *super* *hanc* *Petram* *aedificabo* *ecclesiam* *meam*—Ital. *pietra*, Fr. *pierre*. CATO (234-149): *nascere* *nasci*, Ital. *nascere*, Fr. *naître*; *fracidus*, "mellow," "damaged (olives)," Ital. *frácido*, *fradicio*, "rotten." PACUVIUS (219-129): *causari*, "to plead," not classical, reappears in the Silver Age in the sense of pleading as an excuse, still later in that of disputing, discussing, Fr. *causer*, "to chat, talk"; comp. Ladino *plidar* (plead), "to speak." LUCILIUS (c. 148-103): *acceptor* for *accipiter*, "a hawk," frequent in Low Latin, Ital. *astore*, Fr. *autour*; *quiritare*, "cry"—ut *quiritare* *urbanorum*, sic *jubilare* *rusticorum* *est* (Varro; fam. Cic.)—Ital. *gridare*, Fr. *crier*. Greek words—*gubernum*, "rudder," Ital. *governo*; *schedium*, "improvised or unpolished poem," Ital. *schizzo*, "sketch"; *caballus*, "jade," seems first to occur here—optat *arare* *caballus* (Hor.)—later "horse," "steed," Ital. *cavallo*, Span. *caballo*, Fr. *cheval*, L. Lat. *caballarius*, "chevalier," "knight"; *cyma*, "young sprout of cabbage" (later Plin., Colum.), Ital. *cima*, "top." Q. CLAUDIUS QUADRIGARIUS—Gellius blames several expressions of his as vulgar or rare: *diurnare* *diu* *vivere*, comp. Ital. *soggiornare*, Fr. *sejourner*, Eng. *sojourn*, and *aggiornare*, *ajourner*, *adjourn*; *arboretum*, "grove," Ital. *arboreto*, Span. *arboleda*. VARRO (116-28), especially in *De Re Rustica*: *belare* *balare*, Ital. *belare*, Fr. *bêler*; *olor* *odor*, Span. *olor*; *capitium*, "bodice," Ital. *capezzale*, "cape," "pillow"; *nervium*=*veuplor*, Span. *nervio*; *rubeus*, "red" (later Colum., Pallad.), Fr. *rouge*, Span. *rubio*, "fair"; *badius*, "bay (horse)," a rare word, Ital. *bajo*, Fr. *bai*. LABERIUS (105-48) is blamed by Gellius for using obsolete, rare, and vulgar words: *lavandaria* *lavanda*, later "laundress," Ital. *lavandaja*; *gurdus*, "stupid," a Spanish word, says Quintilian, and in fact we find Old Span.

gordo, "stupid," Mod. Span. "fat,"—comp. *pinguis* Minerva; *pittacium*, "patch," "label,"—*πυττάκιον*, Span. *pedazo*, "piece"; *nunus*, "dwarf,"—*νῦνος*, Ital. *nano*, Fr. *nain*; *botulus*, "sausage" (also Petron.), dim. *botellus* (Martial), later = "bowels," Ital. *budello*, plur. *budella*, Fr. *boyaux*. LUCRETIVUS (94-55): *baubare*, "bark," Ital. *abbajare*, Fr. *aboyer*, Eng. *bay*; *russus*, "red"—a rare word, *russa* gingiva (Catull.), mentioned as usual by Gellius—Ital. *rosso*, "red," Fr. *roux*, *rousse*, "red-haired." Old words mentioned by GRAMMARIANS: *burrus* (see 11, above); *artitrus* = *bonis instructus artibus*, Prov. *artisia*, "trade," Fr. *artisan*; *gluto* (Fest.), *glutto* (Persius and later), Ital. *ghiottoni*, Fr. *glouton* (comp. Lat. *glut glut*, Fr. *glouglou*); *planca* tabula plana, Fr. *planche*, Eng. *plank*; *sarpere* putare, "to imp," Fr. *serpe*, "pruning knife."

Gram-
mar.

C. Grammar (Plautine, when no author quoted).—Gender: *collus collum*, Old Fr. *cols*, now *cov*; *dorsus*, &c. Declensions: *lacte lac*, Ital. *latte* (Petron. *unum lactem biberunt*); *vasum*, Umb. *vaso(r)*, Ital. *vaso*; *ossum*, Ital. *osso*, Fr. *os*; *pauper*, -a, -um (also Petron.), Ital. *povero*. Comparison: *magus pulcer* = Span. *mas hermoso*; even *magis majores*, as vulg. Ital. *più meglio*, vulg. Fr. *plus meilleur*, vulg. Eng. *more better(er)*. The ordinary Romance formation with *plus* only appears in the 3d period. With ego *ipsissimus*, "my very self," comp. *ipsimus*, "himself" i.e., the master of the house (Petron.). Out of (ego) *met-ipsimus* grew Ital. *medesimo*, Span. *mismo*, Fr. *même*. Pronouns: dat. fem. *illae* for *illi*, Ital. *le*; *ecum* = *ecce eum*, Ital. *ecco*—*pater ecum* adventit = *ecco che viene il padre*; *eciste*, *ecista* = Old Fr. *cist*, *ceste*, Mod. Fr. *ce*, *cet*, *cette*; *ecille*, *ecilla* = Old Fr. *cil*, *cele*, Mod. Fr. *celui*, *celle*. In Italian these were replaced by *ecum istum*, Ital. *questo*, and *ecum illum*, Ital. *quello*, analogous to the Plautine *ecum ipsum*, *ecum campse*, &c.; *quotumus*, "which of the number"—*quotumus die huc pervenisti?* Ital. *lavorare a cottimo*, "work by the job." *Unus* indefinite was sometimes very like the modern indefinite article—Huic filia *una* est, "he has a daughter." Ital. *quest'uomo ha una figlia*. *Ille* was sometimes used very like the modern definite article—Imponit *geminorum* alterum in nave *pater*, *illum* reliquit *alterum* apud matrem domi, Ital. *lasciò l'altro colla madre a casa*. Note also *natus nemo* in aedibus, "not a living soul," "not a mother's son," Span. *nadie*, "nobody," likewise from *nata* (res), Span. *nada*, "nothing," whereas the Catalan prefers *res*, Prov. *ren*, *re*, Fr. *rien* (rem). *Homo* is sometimes like an indefinite pronoun—*Nequior nemo*, *quisquamst*, quem *homo* aut amet aut adeat, Fr. *on*. Verbs: *moriri* *mori*, Ital. *morire*, Fr. *mourir*. Active for deponent—*jocare*, Ital. *giocare*, Fr. *jouer*, *partire* = Ital.; *fabulare*, Span. *hablar*. Perfects in *si*—*parsi*, *prae-morsi*, Ital. *morsi*; the formation in *si* greatly increased in Romance. *Habere* with past part. often approaches to modern compound tenses, *Res omnis relictas habeo*, Ital. *ho lasciato tutto*. Adverbs: *Alorsum* ire for *alio*, Prov. *alhors*, Fr. *ailleurs*. Prepositions: *de* for genitive, *dimidium de praeda* mihi dare, Ital. *la metà del bottino*; *ad* for dative, *te ad patrem esse mortuom* renuntiem, Ital. *dire al padre*; *cum* instrumental, *cum* virgis caseum radere, Ital. *con*; *de* instr., *quam illa de meis opulentibus* fiat propensior, Ital. *di*. Peculiar local uses are in Ephesus ire, in Epheso esse, *ab domo*, "from home," ex Epheso, "from Ephesus"; *ab*, from (at) one's house, as *Esne tu ab illo milite*, servus ejus = from (at) the soldier's, foris concrepuit a vicino *sene*, Ital. *dal soldato*, *dal vecchio vicino*.

Syntax
and
phrase-
ology.

Syntax and Phraseology.—*Pater tuus is erat patruelis meus*; comp. Fr. *le père est-il*, Ital. *il padre lo conosco*. Pone aedem *tibi sunt* homines, Ital. *vi sono* degli uomini. Scio jam quid *vis* dicere, Ital. *so* (quel) *che vuoi dire*. *Ne time, ne fac*, Fr. *ne fais pas cela*. *Totus gaudeo, tota sum misera*, even Cic. *falsum est id totum*, "it is all false," Ital. *è tutto falso*, *son tutta contenta*, Fr. *elle est toute joyeuse*. *Multum miseri*, even Cic. *fam. multum bonus*, Ital. *molto buono*, Span. *muy bueno*, Port. *muito bom*. *Bene morigerus* (Plaut.), *bene saepe* (Enn.), *bene mane* (Cic.), Ital. *ben bene*, *ben tosto*, Fr. *bien bon*, *bientôt*, *bien souvent*. *Bene velle alicui*, Ital. *voler bene ad alcuno*. Epityrum estur *insane bene* (Plaut.), showing that the *furiosement* *bien* of the *Præcæuses* was no novelty. Aequo animo *stare*, Ital. *star di buon animo*; *stabam* tanquam mortuus (Petron.), Ital. *stava* come morto, *stare* in letto, *star seduto*, &c. *Dictum (ac) factum* (Ter.), Ital. *detto fatto*, "said and done." *Cum (bona) gratia*, "with a good grace" (Ter.), Fr. *de bonne grâce*. *Id restabat* (*deerat*, *ut*), used ironically, (Ter.), It. *questa mancava ancora*, Fr. *il ne manquait (plus) que cela*.

II. Second (Classical) Period: 80 B.C. to 100 (150) A.D.

Second
period.

At this time we begin to have an idea of what South Latin was, of which the chief characteristics were—(1) its conservative character supported by the antique forms of the Oscan language; (2) its preferring *i* to *e*, as in *sinatum*, *cinuerint*, *cintrum*, *rim*, *ris*, *dilubus* (Lex Jul.; Heraclea); *nigatis*, *tenimus*, *Lucritius*, *dicembres*, *ocilli* (Pompeii), *tenimus* = Mod. Neap. *tenimmo*; *fruminto*, *sipitim* (Puteoli); *venirandae* (Nap.); later *sicundo*, *sipitim* (Borgia, 386); (3) its preferring *u* to *o*, as in *furturnilla*, *posteru*, *alivu* (Pompeii). These forms are constant in Modern South Italian. Now classical

Latin was an approach to South Latin, and there arose a strong reaction against the vulgar North Latin forms. But even a purist like Cicero could not always abstain from using colloquial forms, and he sometimes gives us precious information about familiar pronunciations, as *cum nobis* for *cum nobis*, showing the assimilation of *mn* to *nn*. He hesitates to use the new word *medietas*, which later became the ordinary expression, Ital. *metà*, Span. *mitad*, Fr. *moitié*. Catullus has *involare*, "steal," Ital. *involare*, Fr. *voler*, and *basium*, Ital. *bacio* (for *basio*, *bagio*, like *cacio* caseus), Span. *beso*, Fr. *baiser*, and the familiar caressing *issa* for *ipsa*, Ital. *essa*. He and Horace have *platæa*, "street" (for *platæa* = *πλᾶτεια*), Ital. *piazza*, Fr. *place*. Vitruvius has *octuaginta*, Ital. *ottanta*, *a peregre* = "from abroad," and the Greek words *chalare*, Ital. *calare*, *zelus*, Ital. *geloso*, Fr. *jaloux*, and *schidia*, "wooden chip," "splinter," Ital. *scheggia*. The transition from *b* to *v* begins, *triumphavit* for *-bit* (Lex Jul.). Gradually the popular speech undermined the classical correctness of the brief Golden Age, and at the beginning of the empire again rose to the surface. The emperor Augustus was fond of talking slang and bad grammar, as *simus* for *sumus*, and he wrote as he spoke in his familiar letters, although he was very hard upon a poor *legatus consularis* for barbarously writing *ivi* instead of *ipsi* (Suet., Aug., 88; comp. *proximus* for *propeusimus*).

At Pompeii and Herculaneum we find a town dialect fully developed, half South Latin, half vulgar Roman. Final consonants were dropped, for instance *m* in the acc. *puella*, *laudata*; *t* in the verse "quisquis *ama valia*, *peria* qui *nosci* (?=nescit) *amare* (Pomp.); *s* rarely, *valea* = *valeas* (Pomp.). *H*, the right pronunciation of which had become a mark of education, just as in English (Rusticus fit sermo, si aspires *perperam*; Nigid. Figulus) was constantly dropped, as in *abeto*, *abuaerit* (Pomp.), *abiat* (Herc.). *Nu* took the place of *nd*: *verecunus* (Pomp.), later *innulgen*. (Abella, 170 A.D.), *agenæ* (Puteoli), were generally Italic; comp. Umb. *pihaner* *piandi* (*distennite*, *dispenntie*, Plaut.), Osc. *opsannam* *operandam*; now South Italian—Roman *monno*, Neap. *munno*, Sicil. *munnu* = Ital. *mondo*, Lat. *mundus*. *Ss* was used for *cs* (x) as in words in *-triss* for *-trix* (Pomp.). *Phi* popularly became *p*, as *Aproditæ*, but with those who tried to speak fine *f*, just as they made the Greek *v* an *i*—*Iacinthus*, *Amarillis*, *Dafne*, *Filetus*, Ital. *fisco*, *fisonomia*, &c. *E* for *oe* seems first to occur during the empire, for example, *pomerii* (8 B.C.), *pomerium* (49 A.D.), *Phæbus* (Pomp.). There is no certain evidence of the sound of Germ. *ö*, Fr. *eu*; we see that the first vowel is absorbed by the second. According to Diez, *oe* becomes close *e*, *ae* open *e*, which is true for popular words like Ital. *péna*, Fr. *peine*, but untrue for Latinisms like *fete*, *fedo*, *améno*, *ceto*, *commédia*, *tragedia*, *Fébo*, *oe* in Low Lat. being constantly confounded with *ae*. Original *oe* never becomes *ie*, as *ae* does (*cielo*, *fieno*).

Vocabulary.—We remark at Pompeii *exmuccavit* *emunxit*, Ital. *Vocabu-dial smoccare*, "snuff (the candle)"; *mi similat*, Ital. *mi somiglia*, *lary*.

Fr. *il me ressemble*, elsewhere only in Late Latin. PETRONIUS: *bisaccium*, Ital. *bisaccia*, Fr. *besace*; *nesapius*, "unwise," Ital. *sávio*, *sággio*, Span. *sábio*, Fr. *sage*; *berbez*, Fr. *brebis*; *peduchus*, Ital. *pidocchio*, Fr. *pou* (*panus* facit diminutivum *panucula*, Fest., Ital. *pannocchia*—comp. L. Lat. *genuculum*, *acucula*, Ital. *ginocchio*, *agocchia*, Span. *hinojo*, *aguja*, Fr. *genou*, *aiguille*); *striga*, "witch," Ital. *strega*; *fatuus*, Fr. *fat*; *basilavit* me *spissius*, Ital. *spéssu*, "often." Instances of Petronius's grammar are—*vinus*, *caelus*, comp. Old Fr. *vins*, *ciels*; *jacebat* tanquam *bovis*, Ital. *bove*, *bue*; *hoc vetare* nec *Jovis* potest (Old Lat. *Jovis pater* = Jupiter), Ital. *Giove*; *munus eccellente*, neuter, shows the L. Lat. declension, Ital. *eccellente*; *habet unde* = *il a de quoi* (vivre); *unus de nobis* = *uno di noi* (see also LATIN). PLINY mentions *sanguisuga* as vulgar for *hirudo*, Ital. *sanguisuga*, Fr. *sangue*; he has *gyrare* = Ital. *giare*, "turn," "roam about." PERSIUS (34-62) has *sillopo* *tumidas* *rumpere buccas*, "a slap," L. Lat. *sclopus*, *sculpare*, Ital. *schioppo*, "gun." QUINTILLIAN (c. 40-118): *divarv* quod nostri *possibile* nominant, quæ ut dura videatur appellatio, tamen sola est, Ital. *possibile*, &c. JUVENAL has *bucca fuculum* excitat, Ital. *fuoco*, Fr. *feu*, and TACITUS *spatha*, Ital. *spada*, Fr. *épée* (see also LATIN).

III. Third (Post-Classical) Period: 100 (150) to 300 (350).

This period is represented by the latest pagan inscriptions, by Gellius, Apuleius, &c. On the decay of classical Latin, see LATIN. In pronunciation only few decided changes appear.

1. *I* is inserted before *s* impurum, as *iscripta* (Afr., 197), *εσπεριτω* = *ispirito* (Rome, 269); later this was universal, but in Italian only after consonants—*non ista* (colloq. *non stà*), *in ispirito*, *in iscritto*; Span. always, as *espiritu*, *està*, *escribir*, *escuela*; Fr. *esprit*, *écirre*, *école*.

2. *T* is put for *pt*, as *Setemb.* (Helvet., 219), *Setimus* (Afr., 3d century), later frequent. This assimilation originally came from the north; comp. Etrus. Lat. *Nethumus* (*th* = *t*), Etrus. *Nethuns*, Neptunus, Etrus. Lat. *Setummal*, Etrus. *Sehtummal* = Septimius nata

(inscr. biling.), *Setumo*, *Setimi*, Septimius, Umb. *screihtor*, *screhto*, Ital. *Settimo*, *Nettuno*, *atto aptus*, *cattivo*, *scritto*.

3. *Tt* takes the place of *ct*, as in *Benedictus* (204), *lattuca* (Edict. Diocl., 301). This too came from the north; *vitoria* occurs on an ancient mirror, probably Etruscan. Comp. Umb. *subahtu* and *subator*, formally = *subacti*, *rehte recte*, where *h*, originally sounded, had become mute or nearly so, which is further proved by the spellings *ambrehitu*, *ambretu*, *ambito*, &c.; comp. *tetom(e)*, probably = Ital. *tetto* tectum, just as Ital. *retto* rectus, *atto* actus, *otto* octo, *notte* noctem. This change was restricted to Italy; elsewhere *ct* became *it*, as Fr. *fait* factum, Port. *feito*, Span. *hecho* (= **feitjo*). Likewise *cs* (*x*) became in Italy *ss*, as in Lat. *cossim*, *vissit*, elsewhere *is*, as Span. and Port. *seis*, Fr. *cuisse*, *laisser*.

4. *G* before a single *e*, *i* becomes palatal (like the old-fashioned Eng. *gyarden*, &c.) or nearly *j* (Eng. *y* in *you*), so that both are confounded—*magestati* (inscr. before 243); *cogiugi*, conjugi. The sign for *J* in the Gothic alphabet, taken from Latin *G*, shows the pronunciation of the 4th century.

5. *Ngn* for *gn*, as *congnato*, *singno*, belongs perhaps to this period—*connato*, &c., is also found—E. Ital. *sengno*, now spelt *segno*, with palatal *n*, *degno* dignus, *regno* regnum, &c., Fr. *digne*, &c.; sometimes *n(n)*, as in *conoscere*, Fr. *connaître*. There are traces of some other transitions that appear to have been completed only in the next period.

6. *Vocabulary*.—APULEIUS has *sapidus*, "savoury" (comp. insipidus), Old Fr. *sade*, whence Fr. *maussade* (mal-sade); *morsicare* = Ital.; *follicare*, "breathe" (like a bellows), Port. *folgar*, Span. *holgar*, "rest," "lounges"; *masticare*, Ital. *masticare*, Fr. *mâcher*; *minari* (equum baculis), "threaten," hence "drive," Ital. *menare*, Fr. *mener*; *cambiare* (better than *cambire*), Ital. *cambiare*, Fr. *changer*; *victualis* adj., in the 6th century subst. *victualia* (nom. plur.), Old Fr. and E. Eng. *vitaille*, Eng. *vittles*, spelt etymologically *victuals*; *avicella*, *avicella* for *avicella*, the existence of which had been denied by Varro, L. Lat. *avicellus*, Ital. *uccello*, poet. *augello*, Prov. *auzels*, Old Fr. *oysel*, Mod. Fr. *oiseau*. CÆLIUS AURELIANUS (2d or 3d century) has *testa*, "skull," frequent in the 4th century, Ital. *testa*, "head," Fr. *tête*. LAMPRIDIUS (c. 250): *papilio* = pavilion, *pulicinus*, Ital. *pulcino*, Fr. *poussin*; *pipio*, "pigeon"; *platea*, "place." TERTULLIAN, first Christian author: *rememorare*, "remember," *aeternalis*, "eternal," *compassio*, "compassion," and many other modernisms, such as *plus miser* = Ital. *più misero*, Fr. *plus misérable*. DIOCLETIAN: *fata*, *parca*, Ital. *fata*, Fr. *fee*. SOLINUS (c. 3d century): *repariare*, "to repair (to)." APOCIUS (c. 3d century): *excolidare*, Ital. *scaldare*, Fr. *échauder*; *spatula*, Ital. *spalla*, Span. *espalda*, Fr. *épaule*.

IV. Fourth Period: 300 (350) to 500 (550).

This period extends from the introduction of Christianity to the Middle Ages and the great migrations. Christianity marks an important epoch in the history of the Romance languages. Pagan literature was abhorred, and classical traditions lost. Popular speech got the upper hand; the gospel was preached to the people in the people's own language, and the New Testament translated into vulgar Latin. Several phonetic changes which formerly had been wavering and uncertain became rapidly fixed and decided. The whole language was revolutionized.

1. Palatal *g* or *j* was developed into *dj* (like *gy* in Hung. *Magyar* = palatal *d* + Eng. *y*) or *dzh* (Eng. *j*), sometimes *dz*, and was confounded with original *di*—*Zerax*, Hierax (Cumæ, 202); *Zouuæ* (pagan inscr.), comp. *Diuliali* (568), *Madias* (364), also *Mazas* = *majas*, *Gianuaria* (508), also *Zanuari*, &c. Italian still retains the sound of *dzh* in *giungere* *jungere*, *Giove* *Jovem*, *gènere*, *giacere*, &c. Original *di* in *Aziabenco* (Afr., 195), *medius*, pronounced *medsius* according to Servius (4th century) and Consentius (5th century), Ital. *mezzo*, pronounced *med-zo* (but *giorno* from *diurnus*).

2. *Tt* was assibilated before vowels; there are no certain pre-Christian instances. In the 4th century the Gothic *laikþō* = lectio shows that the change had only begun; *ct* and *ti* were sometimes confounded, as in *καλτος* *calceus* (Plut., c. 100; Ed. Diocl., 301), *ocio* (Rome, 389); we have *ti* for *si* in *aeclitiae* (early Christ. inscr.). In the 5th century the change appears as fully accomplished; the grammarian Pompeius (probably a Mauretanian) expressly teaches the pronunciation *Titus* as *Tisius*, and Consentius (a Gaul) *etiam* as *etiam*, i.e., *etsiam*. In the 6th century we have the Gothic *kairþjōn*, cautionem. It is probable that this change too originally came from the north, especially from Etruria, where it was very old: we have Etrus. *Ventia Venæa*, *Arndia Arnæa*, Etrus. Lat. *Vensci*, *Vensius*, *Arnzius* (while Umbrian has *tertio*, *Martie*, &c.), Mars. Lat. *Marises*, evidently the source of the Latin *Marsi*. At length this pronunciation reached the capital and became general, mostly expressed by *c*, as in *etiam*, *tercius*, *milicia*, *justicia*, *stacio*, *nacionem*, &c. The pronunciation *ts* is confirmed for Spain by Isidore in the 7th century. This sound is

still preserved by Italian in words like *piazza*, *grazia*, *nazione*, *giustizia*, likewise by Old French, as *naciun*, *place*, whereas in Spanish *ts* has coalesced into a lisped *s*, as in *gracia*, *nacion*, and in Portuguese, Provençal, and Modern French it has been assimilated into a hard (voiceless) *s*, as in *placa*, *plassa*, *place*.

3. *Ci* was assibilated before vowels. In the 4th century we have the Gothic *faskja*, which shows no change. Schuchardt is probably right in supposing that *ci* was assibilated a good deal later than *ti*,—an inference from the comparative rarity of instances of change, and from the silence of the grammarians. From instances like *ocio* (see 2) it would appear that *ci* and *ti* had the same sound, but this cannot have been the case, as Italian still keeps up a difference, as in *piaccia* *placeat*, *piazza* *platea*. Yet there may have been a beginning of a palatal affection, making the two sounds somewhat like each other. In the 6th century we have the Gothic *unkfame* (unciarum) and *ovvika* in the Ravenna charters, but on the other hand *πρεκειω* = *precio* for *pretio*, *Urbicitius* (533, which, however, may be a miscorrection, *c* being added instead of substituted for *t*), *Maurigcius* on a Gaulish coin, from the same period,—making it probable that the assibilation had been accomplished. In the 7th and 8th centuries spellings like *onzia* for *uncia* are quite common.

4. The most important change of all was the victory of stress Accent over quantity and tones. The popular songs of the classical period and show a decided prevalence of accent. In the soldiers' songs from quantity, the end of the 3d century stress has quite superseded quantity and is the ruling principle of the metre:—

"Unus homo mille, mille, mille decollavimus.
Tantum vini nemo habet quantum fudit sanguinis."

This is just like the metre of early Christian hymns—"Dies irae, dies illa," and "O Rex aeternae, Domine," &c. The old quantities had been levelled. St Augustine (354-430) says that in his time only a few grammarians had kept up the distinction between *mōrae* and *mōre*, and that the Africans confounded *ōs* and *os*. Servius (4th century) could only find out quantity from stress in words like *imprius*, *amicus*. Consentius says that some, especially Africans, said *piper* for *piper* and *ōrator* for *ōrator*. This does not necessarily mean that all short accented vowels before single consonants had become long; probably both short and long coalesced to a medial quantity, rather short than long, and there was no very marked difference of quantity between accented and unaccented vowels. This appears plainly from the nature of Romance poetry, where stress has only a moderate importance—namely, in the most prominent parts of the verse—while the chief principle is the number of syllables. In Italian, especially in the Tuscan dialect, we may hear *bambino* with short accented *i*, the unaccented *o* being rather longer than the accented *i*, just as Eng. *y* in *pity*, when emphatic, is longer than *i*. In Spanish words like *māno*, *primero*, *señora* the accented vowel is generally as short as the unaccented or even shorter, which does not prevent the Spaniards from counting it as "dos tiempos" (duas moras); the unaccented final syllables are often rather longer, as in Eng. *pity*. In Italian the longest syllables are those containing two or more consonants after the accented vowel, as *tēmpo*, *pazienza*, *bocca*, *gatto*; the chief difference between *fatto* and *fatto* is the length of the *t* in the former. In Spanish and French even long consonants are shortened, as Span. *boca*, *gato*, Fr. *châtie*; *jette* and *achète* are equally short; vowels are generally short or medial, as *une belle ville* (not like *veal*, as the English make it), and are long only by compensation, as in *âne*, *chante* (where the nasal is absorbed by the vowel). The old distinction of tone necessarily disappeared with these, the acute or high even (*Rōmā*) and the circumflex or high falling tone (*Rōma*) being dependent on the quantities.

5. *Vocabulary*.—AUSONIUS (Burdigala, 309-392): *burrae*, *nugae*, Vocabulary. Ital. *burla*, "joke." ARNOBIUS (Afr., c. 330): *coquina*, Ital. *cucina*, lary. Fr. *cuisine*. FIRMICUS MATERNUS (c. 340?): *comptitus*, Ital. *conto*, Fr. *compte*. PALLADIUS (c. 350): *cātus*, "cat"; *species* = Fr. *épices*. AMMIANUS MARCELLINUS (end of 4th century): *molina*, Ital. *molino*, Fr. *moulin*; *impedicare* empêcher; *pillare* = *expiare*, Fr. *pillier*, Ital. *pigliare*; *proba*, *preuve*. VEGETIUS (end of 4th century): *burgus*, castellum parvum, Ital. *borgo*, Fr. *bourg*. JEROME (331-420): *camisia* (Celtic), Ital. *camicia*, Span. *camisa*, Fr. *chemise*; *carricare*, Ital. *caricare*, Span. *cargar*, Fr. *charger*; *impostor* = Eng.; *rancor*, "rancour." THE VULGATE: *grossus*, Ital. *grosso*, Fr. *gros* (see also *LATIN*). SERVIUS (c. 390): *falco*, Ital. *falcone*, Fr. *faucon*. LACRANTIVS (d. c. 330): *meridionalis*. AUGUSTINE (354-430): *combinare*; *vanitare* vanter. CODEX THEODOS. (438): *ezagium*, Ital. *saggio*, Fr. *essai*; *paraveredus*, L. Lat. *palafredus*, Ital. *palafreno*, Fr. *palefroi*; *acucula*, aiguille. CASSIODORUS (beginning of 6th century): *modernus*, "modern." CODEX JUSTINIAN. (527-565): *amicabilis*, "amiable."

V. Fifth Period: 500 (550) to c. 900 (1000).

This period, which extends from the migrations to the fifth first appearance of the modern Romance languages, is the period of Low or barbarous Latin, as written especially in charters and laws. While Christianity had brought vulgar

Latin into the foreground, barbarism quite made away with literary Latin. Latin was not only dead but forgotten. The old sounds and forms had been lost, and the scribes, ignorant of classical grammar, tried nevertheless to make a show of learning by putting Latin forms at random. This makes the language look much more barbarous than it really was. It is sometimes very hard to find out the living popular form under the Latin varnish, and harder still to find out what is proper to each country, as Low Latin is very much the same everywhere. The following were some of the chief peculiarities.

Charac-
teristics
of fifth
period.

1. Old Latin forms reappeared, especially in Italy. Final consonants, especially *m*, *t*, *s*, were dropped or wrongly put. In Italy the nom. *annus* (-os), the acc. *annum* (-om), the dat. abl. *anno*, the acc. plur. *annos*, coalesced in *anno*; as this was the real pronunciation, the scribes confounded the Latin forms. There being no longer any difference between *in locum* and *in loco*, both were confounded; even *in locus*, *per locus*, &c., were written. The prevalence of the type *anno* on the one hand and the growing use of the preposition *de* for the genitive on the other made the genitive *anni* disappear, and *anni* (with which *annis* coalesced) was used solely for the plural, likewise *flori*, *monti*. Sometimes, as in Old French, the objective form *anno*, Old Fr. *an*, was used as a genitive, of which *Hôtel-Dieu* is still a remnant. In the same way Ital. *rosa* became the common singular, *rose* the common plural form. Out of Italy, final *s* being retained, the plural form was *annos*, *rosas*, *florēs*, which is the Spanish (*años*) and Portuguese form, and partly the French, as *roses*, with *fleurs* and *ans* as accusatives. In Provençal and Old French *s* was kept in the nom. sing. masc., *ans*, but in the nom. plur. the oldest form was *i*, retained in some Old French monosyllables—*li illi*, *dūi*, *trei*, *tuit* from *tutti*, used in the Gloss. of Cassel; in polysyllables this *i* was lost, and *an* remained, likewise *flor* (**flori*; comp. *sapienti*, Gloss. Cass.), *munt*. The verbs *canto*, *cantas*, *cantat* in Spanish only lost *t*; in Ital. *cantas* through *cantis* (caused by the affinity of *s* to *t*) became *canti*. In French both *s* and *t* were kept—*chante*, *chantes*; *chantet*, later *chante*; *est*, *vit*, *vient*, and from the analogy of these Mod. Fr. *aime-t-il*, *chante-t-il*. Many old tenses were lost, as *ama(ve)ram*, which even in Latin sometimes had the sense of the simple past (see LATIN), only in the oldest Fr. *rouvret*, *roga(ve)rat*=*rogavit*. *Ama(v)i* became Ital. *amai*, Fr. *aimai*, and was used as simple past (perfectum historicum); the praesens perfectum was expressed by a new tense, as *habeo amatum* (of which early germs are found), Ital. *ho amato*, Span. *he amado*, Fr. *j'ai aimé*. The old future was destroyed and a new future formed out of *amare habeo* (of which early traces are found), Old Ital. *ameraggio*, Mod. Ital. *amerò*, Span. *amaré*, Fr. *j'aimerai*, &c. In consequence of the general loss of body, short words dwindled down so much that they became unfit for use, and were superseded by fuller words or reinforced by composition; this is especially the case in pronouns and particles. As *ad* became *a*, Lat. *a*, *ab* could no longer keep its ground, and was replaced by *de*, likewise *vis* by *fortia*, &c. (see LATIN). *Hic* disappeared and was replaced by *iste*, which remained uncomposed in Span. *este*, and in the others was composed with *ecce*, *eccum* (see above). *Abante*, Mod. Ital. *avanti*, Fr. *avant*, occurs in a pagan inscription. Lat. *unde* became *de unde*, Ital. *donde*; in Spanish this was further composed with *ad*, as *adonde*, and as this in time came to mean "where" a new *de* had to be added,—*de adonde*, &c.

2. *O* became assimilated before single *e*, *i*. That during all the preceding periods *c* had the sound of *k* is proved by Old Latin spellings like *dekem*; by Greek transcriptions, as *Κικέπων*, *Καίσαρ*; by the German renderings *Kaiser* (Old Eng. *cásere*), *Keller*, "cellar," *Kirsche*, "cherry," &c., and by the use of *c* for *k* in Old English, as in *cynne*, "kin," *cennan*, "ken"; by late Latin spellings like *quesquenti*, quiescenti, *pache* (Rome, 408), *chingait* (Gaul, 676), *vachis* (Lucca, 722)—in Italian still *ch=k*, as *chi* quis, *che* quid; and lastly *dulkisma* (Pisaur, 410), *oficina* (Gallic vase, end of 6th century; see *Romania*, xiii. 485). Yet *c* before *e*, *i* must early have had a more palatal sound than before *a*, *o*, *u*, something like the old-fashioned English pronunciation *kyard* for *card*. But it was not until very late that the difference became so marked as to be expressed by different letters: the palatal sound began to be assimilated into something like Italian *ce*, *ci*, Eng. *ch* (as in *child* from Old Eng. *cild*), about the 6th century, although perhaps not equally early everywhere. We find *keirave* and *teitane* (Ravenna charter, 591), and *paze* (inscr. about the same time). Ital. *c=* Eng. *ch* in *paze*, *diceci* (in Central Italy mostly pronounced *sh*), *cielo*; Span. *paz*, *dizez*, *cielo* (lispings from *ts*); Fr. *ciel* (Old *ts*, Mod. *s*). Span. *paz*, *dizez*, *cielo* (lispings from *ts*); Fr. *ciel* (Old *ts*, Mod. *s*).

3. *E* for accented *e* became frequent. As original *i* and *e* were no longer different in quantity, they had to be distinguished by quality; accordingly *vīnum* became Ital. *vīno*, *mīnus* (*mīnus*, open *i*), Ital. *mēno*, with the same vowel as in *vēna* from *vēna*; thus Latin *i* and *e* coalesced; likewise we have *scrībo* scribo, *dēvo* bībo, *sēvo* sēbum, *fīdo* fidus, *fēde* fides, *crēde* crēdit *scrītto* scriptum, *dētto* dictum.

We find traces of this in the Pomp. *veces*, Ital. *vece*. In Low Latin *menus*, *fedes*, &c., are constant. But many who had a little more learning retained the Latin spelling *minus*, pronouncing *mēno(s)*, and by this were induced to write constantly *i* for close *e*, especially accented, as *habire*, *vedire*, *credere*=Ital. *avēre*, *vedēre*, *crēdere*; *vindere*, *stilla*=*vēndere*, *stēlla*, Ital. *vēndere*, *stēlla*, Piedm. *esteila*, Old Fr. *esteile*, Fr. *étoile*. In some few instances this may represent a provincial *i*, as in Sicil. *avīri*, or special cases like Fr. *tenir*, *plaisir*, *merci*.

4. Unaccented *e* for *æ*, which is frequent in Old Latin and not unfrequent in the post-classical age, returns in Low Latin with redoubled force. Thus we find *fedelis* (404), later *Domeneus*, *septemus*, *decemus*, *anama*, *deposeta*, *genetor*, *capete*, *soledos*; in the Ravenna charters *vecedomēno*, *vendecare*, *ordenata*, &c.; in Frankish charters *decemo*, Fr. *dime*, *Domeneus*, *venerabelis*, *nobilis*, *lacrema*, *caretate*, *veretate*, *femēna*, *placetus*, &c. This penetrated even into Central Italy, as in the Tuscan Latin of the 8th century, *dedet*, *placetum*, *homenis*, *inviolavelis*. In Middle Italian *uomeni*, in Modern Italian *Domeneddio*, *ospedale*, are rare remnants of the earlier form. Generally classical *i* has prevailed in Florentine and Italian, as *uomini*, *femmina*, *anima*, *asino*, *ordine*, *spirito*. In the Sienese dialect *e* has remained, as *ordenāre*, *cardenāle*, and in North Italian—Venet. *omeni*, *femēna*, *menēstra*, *ordene*, *dseno*; Lomb. *omen*, *dsen*, *ordenāri*, &c. In Spanish it is not unfrequent—*orden*, *imedo*, *movēddā*, *corredōr*; comp. Prov. *lagrema*, *semenar*, *conoiessedor*, and Old Fr. *aneme*, pronounced *ānme* (the spelling points to an older stage).

5. Unaccented medial *e* was often dropped, though less in Italian, except in the north, as in L. Lat. *dulkisma*, *dulcissima* (Pisaur, 410), answering to modern Romagnuolo forms like *'strissm*=*illustrissimo*; generally L. Lat. *domnus*, *domna*=Ital. *donna*, "lady," "woman." In French all proparoxytones are contracted; for instance, Old Fr. (*asinum*, **as'no*) *asne* āne, (*anima*, **an'ma*) *anme* āme, (*hominem*, **hom'ne*) *homme*, (*femina*, **fem'na*) *femme*.

6. Accented *o* for *ū*, not unfrequent in the preceding period, was constant in Low Latin. While Lat. *lūcem* became Ital. *lūce*, Lat. *crūcem*, *nūcem* (*nūcem*, open *u*) became *crōce*, *nōce*, like *vōce* from *vūcem*; comp. *iūstrus*, Ital. *giusto*, Fr. *juste*, but *augūstrus*, Ital. *agosto*, Fr. *août*. This caused many to write *u* for close *o*, as *oxure* uxore, *geneture* genitorem, although this may partly represent a provincial *u*, as in Sicil. *amūri*. In Old Fr. we have *honour*, *favour*, and still *amour*, and in L. Lat. *curte*=*cohorte*, **cōrte*, Ital. *cōrte*, Fr. *cour*, Eng. *court*.

7. Unaccented *o* for *ū* as in Old Latin is frequent, as in L. Lat. *tabola*, *popolo*, *secolom*, *regola*, *voluntate*, Ital. *tavola*, *popolo*, &c.; even for original *u*, as *mano*, *spirito*.

8. Unaccented medial *o* was often dropped before *l*, in which case the unfamiliar group *l'* was changed into *cl*, as in L. Lat. *oculus*, Ital. *dechio*, Span. *ojo*, Fr. *œil*; *vechus* vetulus, Ital. *vechio* (Old Ital. *veglio*), Span. *viejo*, Fr. *vieil*, *vieux*; also L. Lat. *tabla*=Span. *tábla*, *poplom*=Span. *puéblo*. In French syncope is a law—*table*, *peuple*, *sangle* cingulum, &c.

9. Final unaccented vowels in Italian on the whole obey the general laws. By the loss of the Latin final consonants all words end in a vowel, except such as *per*, *con*, *non*, *in*, *un bel giorno*, *buon giorno*. In South Italian *i*, *u* stand for *e*, *o*. In Spanish *e* is sometimes dropped, as *sed* sitim, Ital. *sète*; *parēd* parietem, Ital. *parète*; *fācil*, *orden*. In Portuguese *o* is pronounced *u*, but often only whispered; *e* is nearly always whispered or mute. In North Italian, Ladino, Catalan, Provençal, and French all final vowels are generally dropped, except *a*, which remains in Provençal, as *port*, but *porta* (Mod. *porto*). In Catalan *a* is mostly pronounced as open *e*; in French this becomes obscure *e*, which in modern French is mute except in such cases as *table ronde*.

10. Accented *ie* stands for *ē*, *uo* for *ū*. As *ē* and *ē*, *ō* and *ō* were levelled in quantity, they were already distinguished in quality, as in Ital. *bēne* *bēne*, *vēne* *vēnae*; Portuguese has got no further than this. But generally this was not distinct enough for the wants of the speakers, and unconsciously *ē* (in which *ē* from Lat. *ae* was included) became *iē*, and *ō* (in which *ō* from Lat. *au* was not included) became *uō*, both diphthongs being generally accented on the last vowel—Ital. and Span. *viēne*, Fr. *vient* venit; Ital. *buōno*, Span. *buēno*; Ital. *suōno*, Span. *suēno* (generally *sonido*) sonus, different from Ital. *sōno* sunt, Span. *son*. This change must be very old, as it is found in nearly all the Romance languages. In Spanish, Provençal, and French *uō* was changed into *uē*, and this in Modern French to *eu*, *œu*, contracted into the sound of *ū*. In Spanish the use of diphthongs is extended to position—*tiēmpo*, *siētte* septem, Ital. *sētte*, *hiērrro*, Ital. *fērro*, *cuērpo*, Ital. *cōrpo*, *muērte*, Ital. *mōrte*. Mark the displacement of stress in popular Latin—*pariētem* for *pariētem*, Ital. *parète*, Span. *paréd*, Fr. *paroi*; *filidus* for *filidus*, Ital. *figliuōlo*, Span. *hijuelo*, Fr. *filéul*.

11. Of *mediae* (voiced stops) for *tenues* (voiceless stops), especially between vowels, we find some few earlier instances, as *grassus* for *crassus*, Ital. *grasso*, Fr. *gras*. This is generally rare in Italian Latin, as *gubitus*, *cubitus*, Ital. *gómto*, and is still comparatively rare in Italian. Yet it occurs in some of the most familiar words, as *ago* acus, *lago*, *luogo*, *segare*, *pagare* (pacare, "to satisfy,"

Accented
and un-
accented
vowels.

"pay"), *pregare*, *budello*, *parentado*, *contado* (comitatus), *contrada*, *spada*, *strada*; *p* from *b* becomes *v*, as in *riva*, *riviera*, *povero*, *savio*; before *r*—*padre*, *madre*, *segreto*, *lebbra*. This recalls similar changes in Umbrian, and was perhaps originally North Italian and from thence penetrated into Tuscany. In Spanish the voiced sounds are the general rule, as *fuégo*, Ital. *fuoco*, *amigo*, Ital. *amico*, *amado*, *finido*, Ital. *amato*, *finito*, *sabér*, Ital. *sapère*, &c., yet there are some exceptions, such as *poco* (paucum). In Old French the soft sound is the constant law, but this mostly disappears later, as in *aimé*, *aimée* (see FRANCE, vol. ix. p. 632 sq.). A general Romance case is *placitum*, Old Ital. *piacito*, Ital. *piato*, Span. *pleito*, Old Fr. *plaid*, through **plagito*, **plajeto*, which is singularly like the Umbrian *feitu*, *feetu* for *fagitu*. A limited case is that of such words as Fr. *raison*, Ital. *ragione* from *rationem*, probably first changed to *ratsione*, **radsione*, thence to *rasione*, which sometimes occurs in Late Latin, and often in Early Italian, Span. *razon*; comp. Ital. *cagione* occasionem.

12. *i* and *e* unaccented before vowels, especially post-tonic, became *j*, as *filjus* (Plautus), *olium* pron. *oljo*. *j* coalesced with the preceding consonant, making it palatal, as in Ital. *figlio*, *oglio*, *figlia*, *maraviglia* (mirabilia), *battaglia*; Span. *maravilla*, *batalla*; Fr. *filie*, *merveille*, *bataille* (in North French the palatal sound is replaced by *i* or *j*), &c. *N*—Ital. *vigna* vinea, *Spagna* Hispania, *ingegno*, *castagna*, *campagna*, *bagno* balneum; Span. *España*, *campaña*; Fr. *vigne*, *champagne*. In some cases *j* was assimilated, as Span. *granja*, *extranjero*, Fr. *songe*, *grange*, *étrange*.

13. Sometimes attraction takes place, *i* being transposed to the radical syllable, especially in French, as *huile*, *bain*, *témoin*, *Antoine*, *gloire*, *histoire*. Before and after *r* peculiar forms appear—Ital. *primaio* (-jo); *mujo* morio; Ital. *primiero*, *cavaliere*, from *primario*, probably assimilated into **primer(i)o* (Dr Thomsen). Forms like *paner*, *sorcerus* are found as early as the 8th century.

14. *Vocabulary*.—During this period the Roman world, after being conquered by the Germanic nations, adopted many words from their conquerors. The German influence was strongest in France; hence we find Germanic expressions for many of the most common words except form-words, though the stock of the language remains Latin. A curious instance, characteristic of the Middle Ages, is *rauba*, which from "robbery," "prey," came to mean "property," Ital. *roba* (robba), "things in general," Span. *ropa*, "linen," "stuff," Fr. *robe*, "gown." In Rumonsch we have *la rauba c'and a mi*, "the property that belongs to me." The German *h*, as in *hair*, *old hadir* = "hate," is peculiar to French, and is still sounded in Normandy. Some Germanic sounds had to be modified, as *w* to *gu*, for instance, *guerra* from *werra*, "war"; *quanto*, Old Fr. *quant*, Fr. *gant*, from *vant*, Dan. *Vante*; in North French *w* remained, whence Eng. *war*, &c. Among the *leges barbarae*, the *LEX SALICA* is perhaps the most remarkable as a document of Low Latin. It has sentences and words like—*hoc sunt particulas causas* = *ce sont pareilles choses*; *si in dominica ambactia fuerit occupatus*, Ital. *ambasciata*, Fr. *ambassade*; *si quis alterum voluerit occidere et colpus praeter fallierit*, Ital. *se il colpo fallisce*; *si quis alterum de sagitta toxicata percutere voluerit et praeter sculpaverit* (see *siloppus*, p. 665); *si quis caballum extra consilium domini sui caballicaverit*, Ital. *cavalcare*, Fr. *chevaucher*; *si quis per malo ingenio in curte Ital. corte*, Fr. *cour* alterius aut in *casa* (Ital. *casa*, "house") *aliquid de furtum miserit*; *companium*, Ital. *compagnia*; *baro*, *baronis*, "a free man," Old Fr. nom. *ber*, obj. *barun*, "hero," "baron"; *diffacere*, Ital. *disfare*, Fr. *défaire*; *excorticare*, Ital. *scorticare*, Fr. *écortcher*. From OTHER LAWS we have—*fortia*, Ital. *forza*, Fr. *force*; *hostis* exercitus, Eng. *host*; *vassus* (Celtic), "a vassal"; *auca*, Ital. *oca*, Fr. *oie* (from *avica*); *troppus*, *grex* (from Germ. *thorp*), Ital. *truppa*, Fr. *troupe*, and also Ital. *tropo*, "too much," Fr. *trop*; *forestis* (from *foris*), "foreign," Ital. *forestiere*; *marca* (Germ.), "border," whence *marchensis*, Ital. *marchese*, Fr. *marquis*; *tornare* (Greek; also Dacian Latin). GREGORY OF TOURS (6th century) has *pagensis*, Ital. *paése*, Fr. *pays*. GREGORY THE GREAT has *merces*, "mercy"; *flasco*, Ital. *fiasco*, "a flask." CORIPPUS (Afr., c. 570): *cara*, "face" (Gr. *kapa*, "head"), Span. *cara*, Old Fr. *chiere*, whence *bonne chiere*, "good cheer" (originally the kind, hospitable countenance of the entertainer). VENANTIUS FORTUNATUS (c. 580): *cofea*, "coif"; *crema*, "cream"; *viaticum*, Ital. *viaggio*, Fr. *voyage*. OTHER SOURCES: *caminus*, "road" (Spanish Latin, 7th century; probably Celtic), Ital. *cammino*, Fr. *chemin*; *directum*, *jus* (Italian Latin, 551), Ital. *dritto*, Fr. *droit*. The late AGHIMENSORES: *circare*, Ital. *cercare*, Fr. *chercher*. OLD GLOSSES (7th and 8th centuries): *aciarium*, Ital. *acciaio*, Fr. *acier*; *cosinus*, *consobrinus*, Ital. *cugino*, Fr. *cousin*; *gamba*, Ital. *gamba*, Fr. *jambe* (Gloss. Cass.). ISIDORE: *trutta*, Fr. *truite*, Eng. *trout*; *cama*, Span. *cama*, "bed"; *ficatum*, "liver" (properly *jecur ficatum*, liver of geese fed with figs), Ital. *fégato*, Span. *hígado*, Fr. *foie*; and *cusire*, *consuere*, Ital. *cucire*, *cucire*, Span. *coser*, Fr. *coudre* (Gloss. Isid.); *selvaticus*, Ital. *selvaggio*, Fr. *sauvage*; *formaticum*, Ital. *formaggio*, Fr. *fromage*.

1 The Greek historians Theophylact (c. 600) and Theophanes relate that the Dacian soldiers said in their native tongue *rópa*, *ρόπα*, *φάρπε*, *περόπα*. This has been called by some the earliest trace of Roumanian.

VI. Sixth (Last) Period.

For the sixth and last period—that is, for the history and Modern distinctive traits of the great modern Romance languages—*Romance*—the reader is referred to the separate articles.

1. *Italian* is distinguished by its harmonious form, its vocalic endings, and the rich fulness of its tones.

2. *Spanish* is distinguished by its regularity, by its short, distinct sounds and its fixed tones, and by many Arabic words. Certain "thick" sounds, as the *j* (like Dutch and South German *ch*, though in the south of Spain much weaker, almost *h*) and the lisping *c*, *z* seem to be rather modern developments than due to direct Arabic influence.

3. *Portuguese* is, with *Gallego* (the dialect of Galicia), the western dialect of Spanish, and has almost the same words, but a very different pronunciation; in sound it approaches somewhat to French, as in the nasal vowels (which, however, are less purely vocalic than in French) and the voiced sounds of *s*, *z*, and *j*. It has partly retained the Old Spanish form, as in *filho* for Span. *hijo*, and partly it has a character of its own owing to its many obscured vowels and contractions, as *boa* for *bona*, *dôr* for *dolor*.

4. *Provençal* in many respects represents the earliest form of French; in others it has peculiar developments (see *PROVENÇAL*). *Catalan* is the southern dialect of Provençal.

5. *French* makes up for the want of the full forms and tones of Italian by its grace and delicacy. It has more of a history than the other Romance languages, Old French being very different from Modern.

6. *Ladino* (*Rumonsch*,² Germ. *Churwälsch*, from the town of Chur) or *Central Romance* extends from the Grisons to Friuli on the Adriatic. It is not uniform, being only an agglomeration of cognate dialects; and it is scarcely more Latin than any other Romance language. It has chiefly been elucidated by Ascoli.

7. *Roumanian* has probably not survived from the old Roman colonists of Dacia, but been imported from Istria (which has a cognate dialect) or Northern Italy. It has been greatly mixed up with Slavonic words and sounds (such as the "mixed" vowels), and has some distinctive marks, such as the post-positive article, *Romunul* = *Romanus ille*; compare the similar phenomenon in the Slavonic dialect of Bulgaria and in the Albanian language.

Literature.—The real founder of scientific Romance philology and linguistics is Friedrich Diez, in his *Grammatik der romanischen Sprachen*, 3 vols., Bonn, 1836-42, and *Etymologisches Wörterbuch der romanischen Sprachen*, 2 vols., 1852. He also published *Altromanische Sprachdenkmäler*, 1846; *Zwei altromanische Gedichte*, 1852; and *Altromanische Glossare*, 1865. Pott contributed several articles on the Low Latin of the *leges barbarae* in the *Zeitschriften* of Höfer and Kuhn. Other authorities on various branches of the subject are—Ducange, *Glossarium mediæ et infimæ latinitatis*, 7 vols.; Marini, *Papiri diplomatici*; Muratori, *Antiquitates Italicae*; Schuchardt, *Der Vocalismus des Vulgärlateins*, 3 vols., 1866-68 (a valuable collection of materials), also several minor works by the same author; and Gaston Paris, *Étude sur le Rôle de l'Accent Latin dans la Langue Française*, Paris, 1862, and *La Vie de St Alexis* (a poem of 11th century), 1872. The principal magazines devoted to the subject are—*Jahrbuch für romanische und englische Literatur* (ed. Wolff, Ebert, and Lembocke), later only *für romanische Literatur*; *Archiv für das Studium der neueren Sprachen* (ed. Herrig), of a more popular character; *Romania* (a quarterly, ed. Gaston Paris and Paul Meyer, since 1872), contains articles of the most eminent Romanists; *Revue des Langues Romanes* (Montpellier, from 1870 onwards), chiefly devoted to Provençal; *Romanische Studien* (ed. Boehmer); *Zeitschrift für romanische Philologie* (ed. Gröber, since 1877); and *Romanische Forschungen* (ed. Vollmöller, since 1884). Mussafia has written many articles and treatises, chiefly in the *Transactions* of the Vienna Academy of Sciences. Ascoli, author of *Studi Critici*, has edited since 1873 the *Archivio Glottologico*, which has articles by Flechia. The *Rivista di Filologia Romanza* (ed. Manzoni, Monaci, and Stengel, 1873) in 1878 became *Giornale di Filologia Romanza* (ed. Monaci). For the etymological dictionaries of the separate languages see the special articles. (J. ST.)*

2 Rumonsch is properly the dialect of the upper Rhine valley, Ladino that of the Engadine. Ascoli includes all varieties under the common name of Ladino.

ROMAN LAW

CHAPTER I.—THE REGAL PERIOD.

Original
elements
of Roman
state.

Contributories to People, Customs, and Law.—The union of the Latin, Sabine, and, to a small extent, Etruscan bands that, as conquerors or conquered, old settlers or new immigrants, together constituted the first elements of the Roman people, did not necessarily involve contemporaneous adoption of identical institutions or identical notions of law. Although they were descended from the same Indo-European stock, and inherited the same primitive ideas about religion and government, those ideas must have been modified in the course of centuries of separate and independent development. The characteristics of the Latin race are said to have been its sense of the importance of discipline and the homage it paid to power and might; those of the Sabines were their religious feeling and their reverence for the gods; the characteristic of the Etruscans was their subservience to forms and ceremonies in matters both divine and human. Corresponding influences are very manifest in the growth of Rome's early public institutions, civil, military, and religious. It does not seem too much to say that these same influences are traceable also in the institutions of the private law. The *patria potestas*, with the father's power of life and death over his children; the *manus* and the husband's power over his wife; the doctrine that those things chiefly was a man entitled to call his own which he had taken by the strength of his arm; the right which a creditor had of apprehending and imprisoning his defaulting debtor and reducing him to slavery,—all these seem to point to a persuasion that might made right. The religious marriage ceremony and the recognition of the wife as mistress of the household and participant in its sacred offices as well as its domestic cares; the family council of kinsmen, maternal as well as paternal, who advised the *paterfamilias* in the exercise of the domestic jurisdiction; the practice of adoption, to obviate the extinction of a family and to prevent its deceased members being deprived of the prayers and sacrifices necessary for the repose of their souls,—these seem to have flowed from a different order of ideas and to bear evidence of Sabine descent. Etruscan influence could make itself felt only at a later date; but to it may possibly be attributed the strict regard that came to be required to the observance of ceremonials and words of style in the more important transactions both of public and private life.

While it can hardly be doubted that the result of the union of Latins and Sabines was that regulations were at once adopted which should apply to their public life as a united people, it is not only conceivable but probable that each tribe, as regarded the private relations of its members, continued for a time to accord a preference to its own ideas and traditions of right and law, and that the amalgamation was a gradual process, partly silent, partly due to regal or pontifical intervention.

Patricians.

Patricians, Clients, and Plebeians.—There was part of the law of Rome that even in the empire was known by the name of *Jus Quiritium*, the Law of the Spearman; and this in the regal period constituted its main element. The *Quirites* were the members of the gentile houses, organized in their curies, primarily for military and secondarily for political purposes. They alone of the rapidly increasing population settled round the *urbs quadrata* ranked as citizens, down at least to the time of Servius Tullius. They alone could consult the gods through the medium of *auspicia*, and participate in the services offered to the tutelary deities of Rome. From

their number the king drew his council of elders, and they alone could take part in the curiate comitia, the assembly of the warriors. They alone could contract a lawful marriage and make a testament; in a word, it was they alone that were entitled directly to the benefit of Rome's peculiar institutions.

These prerogatives they enjoyed as members of the gentile houses. Patrician Rome was a federation of *gentes* or clans, the clans aggregations of families bearing a common name, and theoretically at least tracing their descent from a common ancestor. Whether or not the traditional account of the numerical proportion of families to clans and of clans to curies has any substantial historical foundation, and whatever may be the explanation of the method by which the symmetry on which the old writers dwell with so much complacency was attained, it is beyond doubt that the gentile organization was common to the two races at least that contributed most largely to the citizenship of Rome, and that it was made the basis of the new arrangements. Federation necessitated the appointment of a common chieftain and common institutions, religious, military, political, and judicial. But it was long before these displaced entirely the separate institutions of the federated *gentes*. Every clan had its own cult, peculiar to its own members; this was the universal bond of association in those early times. It had its common property and its common burial-place. It must have had some common council or assembly, for we read not only of special gentile customs but of gentile statutes and decrees. Instances are on record of wars waged by individual *gentes*; so they must have had the right to require military service alike from their *gentiles* and *gentilicii*. Widows and orphans of deceased clansmen were under the guardianship of the *gens*, or of some particular member of it to whom the trust was specially confided. If a clansman left no heirs, his property passed to his fellow gentiles. Over the morals of its members the *gens* exercised supervision and discipline, interfering to prevent prodigality and improvidence, restraining abuses of the domestic authority, and visiting with censure and probably in grave cases with punishment any breach of faith or other dishonourable conduct; and it is difficult to suppose that, within its own limits, it was not constantly called upon, through the medium of its chief, to act the part of peacemaker and arbiter. Finally, its members were always entitled to rely upon its assistance, to have maintenance when indigent, to be ransomed from captivity, to be upheld in their just disputes and quarrels, and to be avenged when killed or injured.

The successes of the burgesses in one petty war after Clients, another deprived many small communities of their independent existence, leaving their members bereft alike of their religion, their territory, and their means of subsistence. These had to turn elsewhere for protection, and in large numbers they sought it from their conquerors. To many others, both voluntary immigrants and refugees from other cities, the new settlement proved a centre of attraction. It was quite ready to receive them, but as subjects only, not as citizens. Following a custom familiar to both Latins and Sabines, the new-comers invoked the protection of the heads of patrician families of repute, to whom they attached themselves as free vassals. The relationship was known as that of patron and client. (See PATRON AND CLIENT, vol. xviii. p. 412.) The client became a dependent member of his patron's clan,—not *gentilis*, however, but only *gentilicius*. His patron had to provide him with all that was necessary for his sustenance and that of his wife

and children; and, as private holdings increased in extent, it was not unusual for the patron or his *gens* to give him during pleasure a plot of land to cultivate for himself. The patron had, moreover, to assist him in his transactions with third parties, obtain redress for him for his injuries, and represent him before the tribunals when he became involved in litigation. The client, on the other hand, had to maintain his patron's interests by every means in his power. But the advantage must have been chiefly on the side of the client, who, without becoming a citizen, obtained directly the protection of his patron and his clan, and indirectly that of the state.

Ple-
beians.

The plebeians, as distinguished from the clients, must be regarded as a heterogeneous mass of non-gentile freemen, small probably in numbers at first, but augmenting with ever greater rapidity, who had of choice or compulsion made Rome their domicile, but declined to subject themselves to a patron. That there was any general cohesion amongst them before the time of Servius there is not the slightest reason to believe. They were of different races, settling in Rome from different motives, practising in many matters different customs. The bulk of them, however, were undoubtedly Latins, with traditions and customs much the same as those of the greater number of the patrician houses; and this it was that in time caused the triumph of Latinism and the predominance of the masterful spirit in the *jus Quiritium*. But by the ruling caste those traditions and customs were simply ignored; till the time of Servius what protection the plebeians got was simply of the grace of the kings, whose policy it was to conciliate them as a body that in time might be a valuable auxiliary against the pretensions of the patricians.

The Regulatives of Public and Private Order.—We look in vain for, and it would be absurd to expect, any definite system of law in those early times. What passed for it was a composite of *fas*, *jus*, and *boni mores*, whose several limits and characteristics it is extremely difficult to define. This may to some extent be accounted for by the fact that much of what was originally within the domain of *fas*, once it had come to be enforced by secular tribunals, and thus had the sanction of human authority, was no longer distinguishable from *jus*; while it may be that others of its behests, once pontifical punishments for their contravention had gone into desuetude, sank to nothing higher than precepts of *boni mores*.

Fas.

By *fas* was understood the will of the gods, the laws given by heaven for men on earth, much of it regulative of ceremonial, but a by no means insignificant part embodying rules of conduct. It appears to have had a wider range than *jus*. There were few of its commands, prohibitions, or precepts that were addressed to men as citizens of any particular state; all mankind came within its scope. It forbade that a war should be undertaken without the prescribed fetial ceremonial, and required that faith should be kept even with an enemy when a promise had been made to him under sanction of an oath. It enjoined hospitality to foreigners, because the stranger guest was presumed, equally with his entertainer, to be an object of solicitude to a higher power. It punished murder, for it was the taking of a god-given life; the sale of a wife by her husband, for she had become his partner in all things human and divine; the lifting of a hand against a parent, for it was subversive of the first bond of society and religion,—the reverence due by a child to those to whom he owed his existence; incestuous connexions, for they defiled the altar; the false oath and the broken vow, for they were an insult to the divinities invoked; the displacement of a boundary or a landmark, not so much because the act was provocative of feud, as because the march-stone itself, as the guarantee of peaceful neighbourhood, was under the

guardianship of the gods. When an offence against any of these rules or prohibitions was inextinguishable, the punishment was usually what is called *sacratio capitis*, excommunication and outlawry of the offender. The *homo sacer* was in every sense of the word an outcast,—one with whom it was pollution to associate, who dared take no part in any of the institutions of the state, civil or religious, whose life the gods would not accept as a sacrifice, but whom, nevertheless, any one might put to death with impunity as no longer god-protected. The precepts of the *fas* therefore were not mere exhortations to a blameless life, but closely approached to laws, whose violation was visited with punishments none the less effective that they were religious rather than civil.

Recent philology derives the word *jus* from the Sanscrit *ju*, to “join, bind, or unite,” from which some deduce as its signification “that which binds,” “the bond of society,” others “that which is regular, orderly, or fitting.” The latest inquirer (M. Bréal) identifies it with the *jōs*, *jaos*, or *jaws* of the Vedas, and the *jaes* of the Zend-Avesta,—words whose exact meaning is controverted, but which he interprets as “the divine will.” *Jubeo* is generally allowed to be a contraction of *jus habeo*, “hold or take as *jus*.” If Bréal's definition can be adopted we obtain a very significant interpretation of the words addressed by the presiding magistrate to the assembled comitia in asking them whether they assented to a law proposed by him,—*Velitis, jubeatis, Quirites*, &c., “Is it your pleasure, Quirites, and do you hold it as the divine will, that,” and so on. As legislation by the comitia of the curies and centuries was regarded as a divine office, and their vote might be nullified by the fathers on the ground that there had been a defect in the *auspicia*, and the will of the gods consequently not clearly ascertained, this explanation of Bréal's seems not without support,—*vox populi vox dei*. If it be right, then the only difference between *fas* and *jus* was that the will of the gods, which both embodied, was in the one declared by inspired and in the other by merely human agency.

This *jus* might be the result either of traditional and inveterate custom (*jus moribus constitutum*) or of statute (*lex*).¹ We look in vain for any legislative enactment establishing such an institution, for example, as the *patria potestas*, or fixing the rules of succession on death. Statute may have regulated some of their details; but they had taken shape and consistency before Rome had its beginning. It can well be believed, however, that in the outset the customs in observance may have been far from uniform, that not only those of the different races but those also of the different *gentes* may at first have varied in some respects, but undergoing a gradual approximation, and in course of time consolidating into a general *jus Quiritium*. That the bulk of the law was customary is universally admitted. But Pomponius speaks of certain laws enacted by the comitia of the curies, which he calls *leges regiae* and which, he says, were collected by one Sext. Papirius in the reign of one of the Tarquins, under the name of *Jus Papirianum*. The opinion of the best authorities is that it is a mistake to attribute these so-called “royal laws” to that assembly. According to the testimony of the old writers it had very little share in the work

¹ There is controversy about the etymology of the word *lex*. It was used by the jurists in two distinct senses—(1) as meaning a comital enactment (Gai., i. 3), and hence was occasionally called *lex publica* (Gai., ii. 104, iii. 174); (2) as meaning an obligation, restriction, condition, declaration, or what not, expressly incorporated in a private deed (*lex privata*), as in the phrases *lex mancipii*, *lex contractus*, *lex testamenti*, &c. Its most likely derivation is from λέγω, “to say” or “to speak.” The *lex publica* was always put to the comitia by word of mouth; and the XII. Tables, in declaring the binding effect of a *lex privata* when grafted on a conveyance or contract *per aes et libram*, use in reference to it the phrase *uti lingua nuncupassit* (Festus, s. v. *Nuncupata*; Bruns, *Fontes jur. rom. antiqui*, p. 23).

of legislation. Romulus *jura dedit* at his own hand, not *jura tulit*. Mommsen is probably near the mark when he describes the *leges regiae* as mostly rules of the *fas* which were of interest not merely for the pontiffs but for the public, with which it was of importance that the latter should be acquainted, that they might know the risks they incurred from their contravention.¹ It is not to be assumed that there was no legislation beyond this; some of the laws of which we have record were of a different character. But on the whole it seems beyond doubt that it was custom rather than statute that was the main factor of the *jus* of the regal period.

Boni
mores.

What went by the name of *boni mores*, quite distinct from the *jus moribus constitutum*, must also be regarded as one of the regulatives of public and private order. Part of what fell within their sphere might also be expressly regulated by *fas* or *jus*; but there was much that was only gradually brought within the domain of these last, and even down to the end of the republic not a little that remained solely under the guardianship of the family tribunal or the censor's *regimen morum*. Its function was twofold: sometimes it operated in restraint of law by condemning—though it could not prevent—the ruthless and unnecessary exercise of legal right, as, for example, that of the head of a house over his dependants; and sometimes it operated supplementarily, by requiring observance of duties that could not be enforced by any compulsitor of law. Dutiful service, respect, and obedience from inferiors to superiors, chastity, and fidelity to engagements, express or implied (*fides*), were among the *officia* that were thus inculcated, and whose neglect or contravention not only affected the reputation but often entailed punishments and disabilities, social, political, or religious. It was the duty of those in authority to enforce their observance by such *animadversio* as they thought proper,—the *paterfamilias* in his family, the *gens* among its members, the king in relation to the citizens generally; and many a wrong was prevented not by the fear of having to make reparation to the party injured but by the dread of the penalties that would follow conduct unbecoming an upright citizen.

Quiri-
tian
family.

The Quiritian Family.—The word *familia* in Roman law had at once a more extensive and a more limited meaning than it has in its English form.² Husband, wife, and children did not necessarily constitute an independent family among the Romans, nor were they all necessarily of the same one. Those formed a family who were all subject to the right or power—originally *manus*,³ but latterly *jus*—of the same family head (*paterfamilias*). He might have a whole host dependent on him,—wife and sons and daughters, and daughters-in-law, and grand-

children by his sons, and possibly remoter descendants related through males; so long as they remained subject to him they constituted but one family, that was split up only on his death or loss of citizenship. But if his wife had not passed in *manum*—and that was common enough even during the republic, and universal in the later empire—she did not become a member of his family: she remained a member of the family in which she was born, or, if its head was deceased or she had been emancipated, was the sole member of a family of her own. Both sons and daughters on emancipation ceased to be of the family of the *paterfamilias* who had emancipated them. A daughter's children could never under any circumstances be members of the family of their maternal grandfather; for children born in lawful marriage followed the family of their father, while those who were illegitimate ranked from the moment of birth as *patresfamilias* and *matresfamilias*.

With the early Romans, as with the Hindus and the Marriage. Greeks, marriage was a religious duty a man owed alike to his ancestors and to himself. Believing that the happiness of the dead in another world depended on their proper burial and on the periodical renewal by their descendants of prayers and feasts and offerings for the repose of their souls, it was incumbent upon him above all things to perpetuate his race and his family cult. In taking to himself a wife, he was about to detach her from her father's house and make her a partner of his family mysteries. With the patrician at least this was to be done only with divine approval, ascertained by *auspicia*. His choice was limited to a woman with whom he had *conubium* (*ἐννομία*) or right of intermarriage. This was a matter of state arrangement; and in the regal period Roman citizens could have it outside their own bounds only with members of states with which they were in alliance, and with which they were connected by the bond of common religious observances. A patrician citizen, therefore, if his marriage was to be reckoned lawful (*justae nuptiae*), had to wed either a fellow-patrician or a woman who was a member of an allied community. The ceremony was a religious one, conducted by the high priests of the state, in presence of ten witnesses, representatives probably of the ten curies of the bridegroom's tribe, and was known as *confarreatio*. Its effect was to dissociate the wife entirely from her father's house and to make her a member of her husband's; for *confarreate* marriage involved what was called in *manum conventio*, the passage of the wife into her husband's "hand" or power, provided he was himself *paterfamilias*; if he was not, then, though nominally in his hand, she was really subject like him to his family head. Any property she had of her own—which was a possible state of matters only if she had been independent before marriage—passed to him as a matter of course; if she had none, her *paterfamilias* provided her a dowry (*dos*), which shared the same fate. Whatever she acquired by her industry or otherwise while the marriage lasted also as a matter of course fell to her husband. In fact, so far as her patrimonial interests were concerned, she was in much the same position as her children; and on her husband's death she had a share with them in his inheritance as if she had been one of his daughters. In other respects *manus* conferred more limited rights than *patria potestas*; for Romulus is said to have ordained that, if a man put away his wife except for adultery or one of two or three other very grave offences, he forfeited his estate half to her and half to Ceres, while if he sold her he was to be given over to the infernal gods.

The *patria potestas* was the name given to the power *Patria* exercised by a father, or by his *paterfamilias* if he was *potestas*. himself in *potestate*, over the issue of such *justae nuptiae*.

¹ The most recent and comprehensive treatise on the subject of the Royal Laws, which also contains references to the earlier literature, is that of Voigt, *Ueber die Leges Regiae*, Leipsic, 1876, 1877 (republished from the *Transactions* of the Saxon Academy). A collection of them from Livy, Dionysius, Plutarch, Servius, Macrobius, &c., will be found in Bruns, p. 1 sq. Of the *Jus Papirianum* referred to by Pomponius no remains are extant; but Paul (*Dig.* l. 16, fr. 144) mentions incidentally that it was commented on by one Granius Flaccus, who was of the time of Julius Cæsar.

² *Familia* and "family" are used in this section solely to designate the group of persons subject to the same *paterfamilias*. Occasionally the word meant (1) a *gens* (or group of families in the stricter sense); or (2) the family estate proper, as in the provisions of the XII. Tables about succession—*adgnatus proximus familiam habeto*; or (3) the family slaves collectively, as in the phrases *familia urbana*, *familia rustica*.

³ This word *manus*, though in progress of time used chiefly to express the power a husband had over the wife who had become a member of his family, was originally the generic term for all the rights exercised not only over the things belonging but also the persons subject to the head of the house; for a slave when enfranchised was said to be "manumitted," and the same phrase was also employed occasionally to express the condition of a *filiusfamilias* released from the *potestas*, although "emancipated" was the usual one.

The Roman jurists boasted that it was a right enjoyed by none but Roman citizens; and it certainly was peculiar to them in this sense, that nowhere else, except among the Latin race from which they had sprung, did the paternal power attain such an intensity. The omnipotence of the *paterfamilias* and the condition of utter subjection to him of his children *in potestate* became greatly modified under the empire; but originally the children, though in public life on an equality with the house father, in private life, and so long as the *potestas* lasted, were subordinated to him to such an extent as, according to the letter of the law, to be in his hands little better than his slaves. They could have nothing of their own: all they earned was his; and, though it was quite common when they grew up for him to give them *peculia*, "cattle of their own," to manage for their own benefit, these were only *de facto* theirs, but *de jure* his. For offences committed by them outside the family circle, for which he was not prepared to make amends, he had to surrender them to the injured party, just like slaves or animals that had done mischief. If his right to them was disputed he used the same action for its vindication that he employed for asserting his ownership of his field or his house: if they were stolen, he proceeded against the thief by an ordinary action of theft; if for any reason he had to transfer them to a third party, it was by the same form of conveyance that he used for the transfer of things inanimate. Nor was this all; for, according to the old formula recited in that sort of adoption known as *adrogation*, he had over them the power of life and death, *jus vitae necisque*. This power was subject to certain restrictions during the infancy of a child; but, when he had grown up, his father, in the exercise of his domestic jurisdiction, might visit his misconduct, not only in private but in public life, with such punishment as he thought fit, even banishment, slavery, or death.

Adroga-
tion and
adoption.

It might happen that a marriage was fruitless, or that a man saw all his sons go to the grave before him, and that the *paterfamilias* had thus to face the prospect of the extinction of his family and of his own descent to the tomb without posterity to make him blessed. To obviate so dire a misfortune he resorted to the practice of adoption, so common in India and Greece. If it was a *paterfamilias* that he adopted the process was called *adrogation* (*adrogatio*); if it was a *filiusfamilias* it was simply *adoptio*. The latter, unknown probably in the earlier regal period, was a somewhat complicated conveyance of a son by his natural parent to his adopter, the purpose of course being expressed; its effect was simply to transfer the child from the one family to the other. But the former was much more serious, for it involved the extinction of one family¹ that another might be perpetuated. It was therefore an affair of state. It had to be approved by the pontiffs, who probably had to satisfy themselves that there were brothers enough of the adrogee to attend to the interests of the ancestors whose cult he was renouncing; and on their favourable report it had to be sanctioned by a vote of the curies, as it involved the deprivation of his *gens* of their possible right of succession to him. The result was that the *adrogeatus*, from being himself the head of a house, sank to the position of a *filiusfamilias* in the house of his adopting parent; if he had had wife or children subject to him, they passed with him into his new family, and so did everything that belonged to him and that was capable of transmission from one person to another. The adopting parent acquired *potestas* and power of life and death over the adopted child exactly as if he were the issue of his body; while the latter enjoyed in his

new family the same rights exactly that he would have had if he had been born in it.

The *manus* and the *patria potestas* represent the master-Domestic ful aspects of the patrician's domestic establishment. Its relations. conjugal and parental ones, however, though not so prominent in the pages of the jurists, are not to be lost sight of. The Roman family in the early history of the law was governed as much by *fas* as by *jus*. It was an association hallowed by religion, and held together not by might merely but by conjugal affection, parental piety, and filial reverence. The purpose of marriage was to rear sons who might perpetuate the house and the family *sacra*. In entering into the relationship the wife renounced her rights and privileges as a member of her father's house; but it was that she might enter into a lifelong partnership with her husband, and be associated with him in all his family interests, sacred and civil. The husband was priest in the family, but wife and children alike assisted in its prayers, and took part in the sacrifices to its lares and penates. As the Greek called his wife the house-mistress, *δεσποίνα*, so did the Roman speak of his as *materfamilias*,² the house-mother. She was treated as her husband's equal. As for their children, the *potestas* was so tempered by the natural sense of parental duty on the one side and filial affection on the other that in daily life it was rarely felt as a grievance; while the risk of an arbitrary exercise of the domestic jurisdiction, whether in the heat of passion or under the impulse of justifiable resentment, was guarded against by the rule which required the *paterfamilias* to consult in the first place the near kinsmen of his child, maternal as well as paternal. Even the incapacity of the subject members of the family to hold property of their own cannot in those times have been regarded as any serious hardship; for, though the legal title to all their acquisitions was in the house-father, yet in truth they were acquired for and belonged to the family as a whole, and he was but a trustee to hold and administer them for the common benefit.

In Greece the *patria potestas* never reached such dimensions as in Rome, and there it ceased, *de facto* at least, when a son had grown up to manhood and started a household of his own. But in Rome, unless the *paterfamilias* voluntarily put an end to it, it lasted as long as the latter lived and retained his status. The marriage of a son, unlike that of a daughter passing into the hand of a husband, did not release him from it, nor did his children become subject to him so long as he himself was *in potestate*. On the contrary, his wife passed on marriage into the power of her father-in-law, and their children as they were born fell under that of their paternal grandfather; and the latter was entitled to exercise over his daughters-in-law and grandchildren the same rights he had over his sons and unmarried daughters. But there was this difference, that, when the *paterfamilias* died, his sons and daughters who had remained *in potestate* and his grandchildren by a predeceased son instantly became their own masters (*sui juris*), whereas grandchildren by a surviving son simply passed from the *potestas* of their grandfather into that of their father.

The acquisition of domestic independence by the death of the family head frequently involved the substitution of the guardianship of tutors (*tutela*) for the *potestas* that had come to an end. This was so invariably in the case of females *sui juris*, no matter what their age: they remained under guardianship until they had passed by marriage *in manum mariti*. It was only pupil males, however, who required tutors, and their office came to an end when puberty

¹ A *paterfamilias* who had no person subject to him constituted a "family" in his own person.

² *Materfamilias* is used in the texts in two distinct senses,—(1) as a woman *sui juris*, i.e., not subject to any family head, and (2) as a wife *in manu mariti*.

was attained. It is doubtful whether during the regal period a testamentary appointment of tutors by a husband or parent to wife or children was known in practice,—probably not. If so the office devolved upon the *gens* to which the deceased *paterfamilias* belonged; and it may reasonably be assumed that it delegated the duties to one of its members in particular, retaining in its collective capacity a right of supervision.

The Quiritian Law of Property.—The distribution of land amongst the early Romans is one of the puzzling problems of their history. The Servian constitution classified the citizens and determined their privileges, duties, and burdens according to the extent of their freeholds; and yet we know very little with certainty of the way in which these were acquired.¹ We have indeed a traditional account of a partition by Romulus of the little territory of his original settlement into three parts, not necessarily of equal dimensions, one of which was intended for the maintenance of the state and its institutions, civil and religious, the second (*ager publicus*) for the use of the citizens and profit of the state, and the third (*ager privatus*) for subdivision among his followers. Varro and Pliny further relate that to each of them he assigned a homestead (*heredium*) of two jugers, equal to about an acre and a quarter, to be held by him and his heirs (*quæ hereditatem sequerentur*),—Pliny adding that to none did the king give more. There can be no doubt that a portion of the territory, gradually augmented through new conquests, was reserved as *ager publicus*; that is sufficiently attested by the complaints made for centuries by the plebeians of its monopolization by the patricians. But it is impossible to admit the accuracy of the account of the mode in which the *ager privatus* was dealt with. The fact that the majority of the Servian local tribes bore the names of well-known patrician *gentes* leads to the conclusion that many at least of the clans held tracts of land in their corporate capacity, and that their constituent families settled alongside each other, each with its own homestead in separate and independent right. It can hardly be assumed, however, that two and a half jugers was its maximum. Seven jugers, about $4\frac{1}{2}$ acres, seems to have been the normal extent of royal grants to plebeians, and a patrician's freehold is not likely to have been less; probably in the ordinary case it was larger, seeing the minimum qualification for the third Servian class was ten jugers, and for the first twenty.² To enable him to make grants during pleasure to his clients he must have held more than seven. But he did not necessarily hold all his lands by gratuitous assignation either from the state or from his *gens*; purchase from the former was by no means uncommon; and it may have been on his purchased lands, outside his *heredium* proper, that his clients were usually employed. Those dependants were also employed in large numbers upon those parts of the *ager publicus* which were occupied by the patricians under the name of *possessionses*, and which really were the source of their wealth. These,

however, were not the property of their occupant; it was the lands acquired by assignation or purchase that were alone regarded as his *ex jure Quiritium*,—what he held in independent ownership to him and his heirs according to the law and custom of the Quirites.

There are some who maintain that in the regal period, Property anterior to the reign of Servius Tullius, there was no private property in movables. The proposition thus broadly stated is manifestly untenable. If no more be meant by it than this, that movables were not then recognized as objects of quiritarian right that could be vindicated as such by a real action *per sacramentum*, it may be admitted that down to the time of Servius, with exception perhaps of captured slaves and cattle, there was no property in movables. But, if it be meant to negative the right of a man to alienate by tradition what he held as his own, and to protect himself, or have protection from the authorities, against any attempt to deprive him of it by theft or violence, then the non-existence of ownership of movables must be emphatically denied. Theft was theft, though the stolen article had been acquired only by natural means,—by barter in the market, by the industry of the maker, or as the product of something already belonging to its holder.

The Quiritian Law of Succession.—The legal order of Quiritian succession in the regal period was extremely simple. It was this: on the death of a *paterfamilias* his patrimony devolved upon those of his children in *potestate* who by that event became *sui juris*, his widow taking an equal share with them, and no distinction being made between movables and immovables, personalty and realty; and, failing widow and children, it went to his *gens*. The notion that between the descendants and the *gens* came an intermediate class under the name of agnates does not seem well founded as regards the regal period; they were introduced by the XII. Tables to meet the case of the plebeians, who, having no *gentes*, were without legal heirs in default of children.³

The later jurists more than once refer to the perfect equality of the sexes in the matter of succession in the ancient law.⁴ But it was more nominal than real. A daughter who had passed into the hand of a husband during her father's lifetime of course could have no share in the latter's inheritance, for she had ceased to be a member of his family. One who was *in potestate* at his death, and thereby became *sui juris*, did become his heir, unless he had prevented such a result by testamentary arrangements. But even then it was in the hands of the *gens* to prevent risk of prejudice to themselves: for she could not marry, and so carry her fortune into another family, without their consent as her guardians; neither could she without their consent alienate any of the more valuable items of it; nor, even with their consent, could she make a testament disposing of it in prospect of death. Her inheritance, therefore, was hers in name only; in reality it was in the hands of her guardians.

Of primogeniture or legal preference of one member of the family over the others there is not the faintest trace. And yet we find record of *heredita* remaining in a family not for generations merely but for centuries,—a state of matters that would have been impossible had every death of a *paterfamilias* necessarily involved a splitting up of the family estate. It is conceivable that this was sometimes prevented by arrangement amongst the heirs themselves;

¹ See Giraud, *Recherches sur le droit de propriété chez les Romains*, Aix, 1838 (only first vol. published); Macé, *Histoire de la propriété, du domaine public, et des lois agraires chez les Romains*, Paris, 1851; Hildebrand, *De antiquissimæ agris Romani distributionis fide*, Jena, 1862; Voigt, "Ueber die *vinæ jugera* d. ältesten röm. Agrarverfassung," in *Rhein. Mus. f. Phil.*, vol. xxiv. (1869), p. 52 sq., the opinions in which are somewhat modified in his *XII. Tafeln*, Leipsic, 1883, vol. i. § 102; Karlowa, *Röm. Rechtsgeschichte*, Leipsic, 1885, vol. i. § 15.

² At the same time the writers of the empire frequently refer to the early *heredium* of seven jugers as having been amply sufficient for its frugal owner, content to till it himself with the aid of his sons. The case of Cincinnatus in the year 293 u.c. is often mentioned: having a freehold of just that extent, he had to sell three jugers to meet engagements for which he believed himself in honour responsible, and yet found the remaining four ample enough to maintain him with all the dignity of a man who had been consul and who became dictator.

³ It is quite true, however, that from the first the order of succession was agnatic; for it was those only of a man's children who were agnate as well as cognate that had any claim to his inheritance; and the *gens* was, theoretically at least, just a body of agnates. The supposed mention of agnates in a law attributed to Numa rests simply on a conjecture of I. G. Huschke's (*Analecta litteraria*, Leipsic, 1826, p. 375). The law, which is preserved in narrative by Servius, *In Virg. Eclog.*, iv. 43, runs thus: "In Numæ legibus cautum est, ut si quis imprudens occidisset hominem, pro capite occisi et natis ejus in cautione (Scalig., concione) offerret arietem." Huschke's substitution of *agnatis* for *et natis* is all but universally adopted; but, even were it necessary, it need mean nothing more than his children *in potestate* or his *gens*.

⁴ The Voconian law of 585 u.c. avowedly introduced something new in prohibiting a man of fortune from instituting a woman, even his only daughter, as his testamentary heir; but even it did not touch the law of intestacy.

and the practice of every now and then drafting the younger members of families to colonies diminished the number of those who had a claim to participate. But the simplest plan of avoiding the difficulty was for the *paterfamilias* to regulate his succession by testament; and there can be little doubt that originally such a deed was had recourse to, not so much for instituting a stranger heir when a man had no issue—according to patrician notions his duty then was to perpetuate his family by adopting a son—as for partitioning the succession when he had more children than one.

Testaments. There were two sorts of testaments made use of by the patricians of the regal period,—that made in the comitia of the curies (*test. calatis comitiis*) and that made in the presence of a few comrades on the eve of battle (*test. in procinctu factum*). The first at least—and the second was just a substitute for it on an emergency—was far from being an independent exercise of the testator's *voluntas*. For, though in course of time, and under the sanction of the *uti legassit ita jus esto* of the XII. Tables, the curies may have become merely the recipients of the oral declaration by the testator of his last will, in order that they might testify to it after his death, it is impossible not to see in the comital testament what must originally have been a legislative act, whereby the testator's peers, for reasons which they and the presiding pontiffs thought sufficient, sanctioned in the particular case a departure from the ordinary rules of succession. The pontiffs were there to protect the interests of religion, and the curies to protect those of the testator's *gens*; and it is hardly conceivable that a testament could have been sanctioned by them which so far set at naught old traditions as to deprive a *filiusfamilias* of his birthright, at least in favour of a stranger.

Family, *Family, Property, and Succession amongst the Plebeians.*—If perfect identity of law and custom cannot be assumed to have existed amongst the patricians in the earliest years of Rome, far less can it be supposed to have existed amongst the heterogeneous population that constituted the *plebs*. A large proportion of them, it is true, were of Latin descent, to whom gentile institutions and the *manus* and the *patria potestas* of the family were nothing strange; but alongside of them were other tribes that Rome had vanquished, who had very different traditions, and some of whom, as is thought by one or two writers of note, laid more store on female kinship than on that through males. From the moment that any of the former became part of the Roman *plebs* everything like gentile organization was of course suppressed; public policy could not suffer the continuance of what might have proved an element of danger to the state. The inevitable consequence was a disturbance of the whole family system. Having no longer any clansmen to stand by them in emergencies, to avenge their quarrels and deaths, and to act as guardians of their widows and orphans, the plebeians of Latin origin seem to have drawn closer in their ideas to their fellows of Etruscan and Hellenic descent, and to have transferred their regards to the circle of their relatives by blood and marriage (*cognati et affines*). It is remarkable that, notwithstanding the pre-eminence given to agnates by the XII. Tables in matters of tutory and succession, the law reserved to the cognates, as distinguished from the agnates, certain rights and duties that in patrician Rome must have belonged to the *gens*,—for example, the duty of prosecuting the murderer (originally of avenging the death) of a kinsman, and the right of appeal against a capital sentence pronounced upon a kinsman. This can only have been because in olden times, when agnation was unknown as distinct from the *gens*, it was plebeian practice to entrust those rights and duties to the sobriol circle of cognates.¹

In the discussions on the Canuleian law in the year 309

U.C. it suited the line of argument of patrician orators to decry plebeian unions as something not deserving of the name of *nuptiae*, and to stigmatize them as mere *matrimonia*,—relations entered into between men and women for the sake of making the latter mothers, but involving none of those features that characterized patrician marriage.² That there may have been laxity amongst many of the plebeians in their domestic relations is extremely probable. The ceremony of *confarreatio* was denied to them, and *coemptio* (as seems likely) was not yet invented, so that the only way of contracting a marriage that was open to them was simple interchange of consent, which was not legally creative of *manus*. Whether it was creative of *patria potestas* over the issue of the union may be doubted. Some of the plebeians may have been of opinion that it did create it and may *de facto* have exercised the right it conferred, while others may have been indifferent as to whether it did or not; but we may be very sure that the patricians denied its possibility, on the ground that it was a prerogative of Roman citizens, amongst whom the plebeians had no claim to rank.

The accounts of the early distributions of land amongst Property, the plebeians are even more uncertain than those we have of its distribution amongst the patricians. They had undoubtedly become freeholders in large numbers before the Servian reforms. But they probably attained that position only by gradual stages. There are indications that their earliest grants from the kings in their character of royal clients (as Cicero calls them) were only during pleasure; but latterly, as they increased in numbers and importance, they obtained concessions of *heredia* varying in extent from two to seven jugers. That those who had the means also frequently acquired land by purchase from the state may be taken for granted. In fact there is good reason to believe that by the time of Servius the plebeians were as free to hold land in private property as the patricians, although the stages by which they reached equality in this respect are uncertain and difficult to follow. As for movable property their rights in it were presumably the same as those of the patricians.

As regards the law of succession it may safely be assumed Succession, that by custom at all events the children of a plebeian usually took his estate on his death. But, as he was not a member of a *gens*, there was no provision for the devolution of his succession on failure of children. The want of them he could not supply by adoption, as he had for long no access to the assembly of the curies; and it is very doubtful if adoption of a *filiusfamilias* was known before the reforms of Servius Tullius. The same cause that disqualified him for adopting a *paterfamilias* disqualified him for making a testament *calatis comitiis*; and even one in *procinctu* was impossible, since, although before the time of Servius plebeians may occasionally have served in the army, they were not citizens, and so had not the requisite capacity for making a testament. Until therefore the XII. Tables introduced the succession of agnates a plebeian unsurvived by children was necessarily heirless,—that is to say, heirless in law. But custom seems to have looked without disfavour on the appropriation of his *heredium* by an outsider: a brother or other near kinsman would have the earliest opportunity, and, if he maintained his possession of it in the character of heir for a reasonable period, fixed by the XII. Tables at a year, the law dealt with him as heir, and in course of time the pontiffs imposed upon him the duty of maintaining the family *sacra*. This was the origin, and a very innocent and laudable one,

¹ On this subject see Klenze, *Das Familienrecht der Cognaten und Affinen nach röm. u. verwandten Rechten*, Berlin, 1828.

² The same notion accounts for the grammatically untenable explanation of *patrii* in Liv., x. 8, § 10, "Qui patrem clere possunt," i.e., patricians were father's sons, while plebeians, before they were admitted to citizenship and *conubium*, were only reckoned mother's sons.

of the *usucapio pro herede*, which Gaius condemns as an incomprehensible and infamous institution, and which undoubtedly lost some of its *raison d'être* once the right of succession of agnates had been introduced.

Contract
and its
breach.

Contract and its Breach.—To speak of a law of obligations in connexion with the regal period, in the sense in which the words were understood in the later jurisprudence, would be a misapplication of language. It would be going too far to say, however, as is sometimes done, that before the time of Servius Rome had no law of contract; for men must have bought and sold, or at least bartered, from earliest times,—must have rented houses, hired labour, made loans, carried goods, and been parties to a variety of other transactions inevitable amongst a people engaged to any extent in pastoral, agricultural, or trading pursuits. It is true that a patrician family with a good establishment of clients and slaves had within itself ample machinery for supplying its ordinary wants, and was thus to a great extent independent of outside aid. But there were not many such families; and the plebeian farmers and the artisans of the guilds were in no such fortunate position. There must therefore have been contracts and a law of contract; but the latter was very imperfect. In barter—for at that time money was not yet in use—with instant exchange and delivery of one commodity against another, the transaction was complete at once without the creation of any obligation. But in other cases, such as those alluded to, one of the parties at least must have trusted to the good faith of the other. What was his guarantee, and what remedy had he for breach of engagement?

His reliance in the first place was on the probity of the party with whom he was dealing,—on the latter's reverence for Fides, and the dread he had of the disapprobation of his fellows should he prove false, and of the penalties, social, religious, or pecuniary, that might consequently be imposed on him by his *gens* in the case of a patrician, by his guild in the case of a craftsman, or by the king in the case of any other plebeian.¹ If the party who had to rely on the other's good faith was not satisfied with his promise and the grasp of the right hand that was its seal,² he might require his solemn oath (*jusjurandum*); and it can hardly be doubted that, whatever may have been the case at a later period, in the time of the earlier kings he who forswore himself was amenable to pontifical discipline. If he preferred a more substantial guarantee, he took something in pledge or pawn from the other contractor; and, though he had no legal title to it, and so could not recover it by judicial process if he lost possession, yet so long as he retained it he had in his own hand a *de facto* compulsor to performance. Upon performance he could be forced to return it or suffer a penalty,—not by reason of obligation resulting from a contract of pledge, for the law as yet recognized none, but because, in retaining it after the purpose was served for which he had received it, he was committing theft and liable to its punishment. At this stage breach of contract, as such, does not seem to have legitimated any action for damages or reparation

¹ Such as debarment from gentile or guild privileges, exclusion from right of burial in the gentile or guild sepulchre, fines in the form of cattle and sheep, &c.

² Some of the old writers (e.g., Liv., i. 21, § 4, xxiii. 9, § 3; Plin., H.N., xi. 45; Serv., *In Aen.*, iii. 687) say that the seat of Fides was in the right hand, and that to give it (*promittere dextram*),—is this the origin of the word "promise"?—in making an engagement was emphatically a pledge of faith. See a variety of texts illustrating the significance of the practice, and testifying to the regard paid to Fides before foreign influences and example had begun to corrupt men's probity and trustworthiness, in Lasaulx, *Ueber d. Eid bei d. Römern*, Würzburg, 1844, p. 5 sq.; Danz, *Der sacrale Schutz im röm. Rechtsverkehr*, Jena, 1857, pp. 139, 140; Pernice, *Labes*, vol. ii., Halle, 1876, p. 408 sq.

before the civil tribunals; but it is not improbable that, where actual loss had been sustained, the injured party was permitted to resort immediately to self-redress by seizure of the wrongdoer or his goods. Such self-help was according to the spirit of the time,—not self-defence merely in presence of imminent danger, but active measures for redress of wrongs already completed.

Public and Private Offences and their Punishment.—For offences anything like a clear line of demarcation between crimes, and their offences, and civil injuries we look in vain in regal Rome. Offences against the state itself, such as trafficking with an enemy for its overthrow (*proditio*) or treasonable practices at home (*perduellio*), were of course matter of state concern, prosecution, and punishment from the first. But in the case of those that primarily affected an individual or his estate there was a halting between, and to some extent a confusion of, the three systems of private vengeance, sacral atonement, and public or private penalty.³ It has been attempted to explain the coexistence of these systems by reference to the different temperaments of the races that constituted united Rome; and this certainly is a consideration that cannot be left out of view. But the same sequence is observable in the history of the laws of other nations whose original elements were not so mixed, the later system gradually gaining ground upon the earlier and eventually overwhelming it. The remarkable thing in Rome is that private vengeance should so long not only have left its traces but really continued to be an active power. It must still have been an admitted right of the *gens* or kinsmen of a murdered man in the days of Numa; otherwise we should not have had that law of his providing that, where a homicide was due to misadventure, the offering to them of a ram should stay their hands. To avenge the death of a kinsman was more than a right: it was a religious duty, for his *manes* had to be appeased; and so strongly was this idea entertained that, even long after the state had interfered and made murder a matter of public prosecution, a kinsman was so imperatively bound to set it in motion that if he failed he was not permitted to take anything of the inheritance of the deceased. Private vengeance was lawful too at the instance of a husband or father who surprised his wife or daughter in an act of adultery; he might kill her and her paramour on the spot, though, if he allowed his wrath to cool, he could afterwards deal with her only judicially in his domestic tribunal. The talion we read of in the XII. Tables is also redolent of the *vindicta privata*, although practically it had become no more than a compulsor to reparation. And even the nexal creditor's imprisonment of his defaulting debtor (*infra*, p. 694), which was not abolished until the fifth century of the city, may not unfittingly, in view of the cruelties that too often attended it, be said to have savoured more of private vengeance than either punishment or procedure in reparation.

Expiatio, supplicium, sacratio capitis, all suggest offences against the gods rather than against either an individual or the state. But it is difficult to draw the line between different classes of offences, and predicate of one that it was a sin, of another that it was a crime, and of a third that it was but civil injury done to an individual.⁴ They ran into each other in a way that is somewhat

³ See Abegg, *De antiquissimo Romanorum jure criminali*, Königsberg, 1823, p. 36 sq.; Rein, *Das Criminalrecht der Römer*, Leipsic, 1844, p. 24 sq.; Clark, *Early Roman Law: Regal Period*, London, 1872, p. 34 sq.

⁴ Voigt (*XII. Tafeln*, vol. i. p. 484) observes that the patrician looked upon every offence as committed at once against gods and men, and held that the punishment should be one that satisfied both; hence the *deo necari*, *sacratio capitis*, and *consecratio bonorum*. The plebeians regarded its two moments as separable, and (as appears from the spirit of the XII. Tables) left it to the pontiffs to protect the gods, putting it on the state to protect itself by ordinary death punishment, addition into slavery, declaration of *improbilas* or intestability, talion, and pecuniary penalties.

perplexing. Apparently the majority of those specially mentioned in the so-called *leges regiae* and other records of the regal period were regarded as violations of divine law, and the punishments appropriate to them determined upon that footing. Yet in many of them the prosecution was left to the state or to private individuals. It is not clear, indeed, that there was any machinery for public prosecution except in treason and murder,—the former because it was essentially a state offence, the latter because it was comparatively early deemed expedient to repress the blood-feud, which was apt to lead to deplorable results when friends and neighbours appeared to defend the alleged assassin.¹

Take some of those offences whose sanction was *sacratio capitis*. Breach of duty resulting from the fiduciary relation between patron and client, maltreatment of a parent by his child, exposure or killing of a child by its father contrary to the Romulan rules, the ploughing up or removal of a boundary stone, the slaughter of a plough-ox,—all these were capital offences; the offender, by the formula *sacer esto*, was devoted to the infernal gods. Festus says that, although the rules of divine law did not allow that he should be offered as a sacrifice to the deity he had especially offended (*nec fus est eum immolari*), yet he was so utterly beyond the pale of the law and its protection that any one might kill him with impunity. But, as the *sacratio* was usually coupled with forfeiture of the offender's estate or part of it to religious uses, it is probable that steps were taken to have the outlawry or excommunication judicially declared, though whether by the pontiffs, the king, or the curies does not appear; such a declaration would, besides, relieve the private avenger of the incensed god of the chance of future question as to whether or not the citizen he had slain was *sacer* in the eye of the law.

That there must have been other wrongful acts that were regarded in early Rome as deserving of punishment or penalty of some sort, besides those visited with death, sacratio, or forfeiture of estate, total or partial, cannot be doubted; no community has ever been so happy as to know nothing of thefts, robberies, and assaults. The XII. Tables contained numerous provisions in reference to them; but it is extremely probable that, down at least to the time of Servius Tullius, the manner of dealing with them rested on custom, and was in the main self-redress, restrained by the intervention of the king when it appeared to him that the injured party was going beyond the bounds of fair reprisal, and frequently bought off with a composition. When the offence was strictly within the family, the *gens*, and perhaps the guild, it was for those who exercised jurisdiction over those corporations to judge of the wrong and prescribe and enforce the penalty.

Effect of the Servian Reforms on the Private Law.—The aim of the constitutional, military, and financial reforms of Servius Tullius was to promote an advance towards equality between patricians and plebeians. While it may be an open question whether the institution of the comitia of the centuries was of his doing, or only a result of his arrangements in after years, it seems clear that he had it in view to admit the plebeians to some at least of the privileges of citizenship, imposing on them at the same time a proportionate share of its duties and its burdens. Privileges, duties, and burdens were alike to be measured by the citizen's position as a freeholder; the amount of real estate with its appurtenances held by him on quiritarian title was to determine the nature of the military service he was to render, the extent to which he was to be liable for tribute, and, assuming Servius to have contemplated the creation of a new assembly, the influence he was to exercise in it.

To facilitate the execution of his scheme it was necessary to establish a register of the citizens (*census*), which should contain, in addition to a record of the strength of their families, a statement of the value of their lands and appurtenances, and which should be revised periodically. In order to ensure as far as possible certainty of title, and relieve the officials of troublesome investigations into the genuineness of every alleged change of ownership between two valuations, it was further declared—presumably by Servius—that no alleged transfer would be recognized which had not been effected publicly, with observance of certain prescribed solemnities, or else by surrender in

court before the supreme magistrate. The form of conveyance thus introduced got the name of *mancipium*, and at a later period *mancipatio*, while the lands and other things that were to pass by it came to be known—whether from the first or not is of little moment—as *res mancipi*. Hence arose in the law of property a distinction of great importance, only abolished by Justinian more than a thousand years later, between *res mancipi*, which were transferable in quiritarian right only by mancipation or surrender in court, and *res nec mancipi*, which were transferable by simple delivery.

Mancipation is described by Gaius, but with particular reference Mancipatio to the conveyance of movable *res mancipi*, as a pretended sale in the presence of five citizens as witnesses and a *libripens* holding a pair of copper scales. The transferee, with one hand on the thing being transferred, and using certain words of style, declared it his by purchase with an *as* (which he held in his other hand) and the scales (*hoc aere aeneaque libra*); and simultaneously he struck the scales with the *as*, which he then handed to the transferor as figurative of the price. The principal variation when it was an immovable that was being transferred was that the mancipation did not require to be on the spot: the land was simply described by its known name in the valuation roll. Although in the time of Gaius only a fictitious sale—in fact the formal conveyance upon a relative contract—yet it was not always so. Its history is very simple. The use of the scales fixes its introduction to a time when coined money was not yet current, but raw copper nevertheless had become a standard of value and in a manner a medium of exchange. That, however, was not in the first days of Rome. Then, and for a long time, values were estimated in cattle or sheep, fines were imposed in them, and the deposits in the *legis actio sacramento* (*infra*, p. 681) took the same form. The use of copper as a substitute for them in private transactions was probably derived from Etruria. But, being only raw metal or foreign coins, it could be made available for loans or payments only when weighed in the scales: it passed by weight, not by tale. There is no reason for supposing that the weighing was a solemnity, that it had any significance beyond its obvious purpose of enabling parties to ascertain that a vendor or borrower was getting the amount of copper for which he had bargained.

It was this practice of everyday life in private transactions that Servius adopted as the basis of his mancipationary conveyance, grafting on it one or two new features intended to give it publicity and as it were state sanction, and thus render it more serviceable in the transfer of censurable property. Instead of the parties themselves using the scales, an impartial balance-holder, probably an official, was required to undertake the duty, and five citizens were required to attend as witnesses, who were to be the vouchers to the census officials of the regularity of the procedure. They are generally supposed to have been intended as representatives of the five classes in which Servius had distributed the population, and thus virtually of the state; and the fact that, when the parties appealed to them for their testimony, they were addressed not as *testes* but as *Quirites* lends some colour to this view. Servius is also credited with the introduction of rectangular pieces of copper of different but carefully adjusted weights, stamped by his authority with various devices (*aes signatum*), which are usually supposed to have been intended to take the place of the raw metal (*aes rude*) formerly in use, and so facilitate the process of weighing; but there is more reason for thinking they were cast and stamped as standards to be put into one scale, while the raw metal whose weight was to be ascertained was put into the other.

Instead, therefore, of being a fictitious sale, as Gaius describes it, and as it became after the introduction of coined money early in the 4th century, the *mancipium* or mancipation, as regulated by Servius, was an actual completed sale in the strictest sense of the term. What were the precise words of style addressed by the transferee to the transferor, or what exactly the form of the ceremonial, we know not. But, as attendance during all the time that some thousands of pounds perhaps of copper were being weighed would have been an intolerable burden upon the five citizens convoked to discharge a public duty, it may be surmised that it early became the practice to have the price weighed beforehand, and then to reweigh, or pretend to reweigh, before the witnesses only a single little bit of metal (*raudasculum*), which the transferee then handed to the transferor as “the first pound and the last,” and thus representative of the whole.² Whatever may have been its form, how-

¹ On murder (*parricidium*) in regal Rome, see Osenbrüggen, *Das altromische Paricidium*, Kiel, 1841, and review by Dollmann in Richter's *Krit. Jahrbuch*, vol. xi. (1842), p. 144 sq.; Clark, *op. cit.*, p. 41 sq.

² The conjecture is suggested by the words of style in the *solutio per aes et libram*, Gai., iii. §§ 173, 174. There were some debts from which a man could be effectually discharged only by payment (latterly fictitious) by copper and scales in the presence of a *libripens* and the usual five witnesses. In the words addressed to the creditor by the debtor making payment these occurred—*hanc tibi libram primam*

ever, its effect was instant exchange of property against a price weighed in the scales. The resulting obligation on the vendor to maintain the title of the vendee, and the qualifications that might be superinduced on the conveyance by agreement of parties—the so-called *leges mancipii*—will be considered in connexion with the provisions of the XII. Tables on the subject (*infra*, p. 690).

Res mancipi. The things included in the class of *res mancipi* were lands and houses held on quiritarian title, together with rights of way and aqueduct, slaves, and domestic beasts of draught or burden (oxen, horses, mules, and donkeys); all others were *res nec mancipi*. In the time of Servius and during the greater part of the republic the domain land (*ager publicus*) in Italy, until it was appropriated by private owners, was also reckoned as *res nec mancipi*; like all other things of the same class, it passed by simple delivery, whereas *res mancipi* could not be transferred in full ownership except by mancipation or surrender in court. Many theories have been propounded to account for the distinction between these two classes of things, and to explain the principle of selection that admitted oxen and horses into the one, but relegated sheep and swine, ships and vehicles, to the other. But there is really little difficulty. Under the arrangement of Servius what was to determine the nature and extent of a citizen's political qualifications, military duties, and financial burdens was the value of his *heredium* (and other freeholds, if he had any), and what may be called its appurtenances—the slaves that worked for the household, the slaves and beasts of draught and burden that worked the farm, and the servitudes of way and water that ran with the latter. It may be that in course of time slaves without exception were dealt with as *res mancipi*,—without consideration, that is to say, whether they were employed on their owner's house or farm or on any part of the public lands in his occupancy—and reasonably, because they were often shifted from the one to the other. But the cattle a man depastured on the public meadows were no more *res mancipi* than his sheep. To say that the things classed as *res mancipi* were selected for that distinction by Servius because they were what were essential to a family engaged in agricultural pursuits would be to fall short of the truth. They constituted the *familia* in the sense of the family estate proper; whereas the herds and flocks, and in time everything else belonging to the *paterfamilias*, fell under the denomination of *pecunia*. So the words are to be understood in the well-known phraseology of a testament, *familia pecuniaque mea*.

The public solemnity of *mancipatio* thus sanctioned as a mode of transferring a quiritarian right of property, for which *manus* was probably as yet the only technical descriptive word in use, was not long of being adapted to other transactions in which *manus* of a different sort was to be acquired,—for example, coemption, emancipation, adoption of a *filiusfamilias*, the contract of *nexum*, release of a nexal debtor, and that *mortis causa* alienation of his estate by a plebeian which in time developed into the testament *per aes et libram*.

Marriage per aes et libram. It has been already explained (p. 674) that, prior to the time of Servius, the matrimonial unions of the plebeians were not, in the estimation of the patricians at least, regarded as lawful marriages (*justae nuptiae*), although amongst themselves they may have been held effectual and productive, if not of *manus*, at all events of *patria potestas*. For this there were two reasons: (1) not being citizens, they did not possess the preliminary qualification for *justae nuptiae*, namely, *conubium*; and (2) not being patricians, the only ceremony of marriage known to the law was incompetent to them. The first obstacle was removed by their admission by Servius to the ordinary rights of citizenship, the second by the introduction of the civil ceremony of coemption. Once the efficacy of mancipation as a mode of acquiring *manus* over things was established, its adoption by the plebeians, now citizens enjoying *conubium*, as a method of acquiring *manus* over their wives was extremely natural. The scales, the *libripens*, and the five witnesses were all there; but, as there was no real price to be paid, the only copper that was needed was a single *randusculum*. The words recited in the ceremonial, unfortunately not preserved, were necessarily different from those in an ordinary mancipation, and, according to the testimony of a considerable number of ancient writers, and as the word *coemptio* itself seems to indicate (though this is disputed by most modern civilians), the nominal purchase was mutual; the man acquired a *materfamilias* who was to bear him children and enable him to perpetuate his family, while she acquired a *paterfamilias* who was to maintain her while the marriage lasted, and in whose succession she was to share when a widow. It was accompanied with other observances described by many of

postremamque expendo ("I weight out to you this the first and the last pound"). The idea is manifestly archaic, and the words, taken strictly, are quite inappropriate to the transaction in the form it had assumed long before the time of Gaius.

the lay writers, but these were matters of usage and fashion rather than of law, and it might be, and often was, accompanied also with religious rites, which, however, were private, not public as in confarreation. It is common, but not quite accurate, to speak of coemption as a form of marriage. It was strictly the acquisition of *manus* by the husband over his wife, and probably in most cases contemporaneous with the marriage; but they were really distinct, the latter being completed simply by interchanged consent. That this was so latterly at least is evident from two facts,—(1) that, according to Gaius, the *coemptio* might follow the marriage at any distance of time; and (2) that, according to the same authority, though the marriage was dissolved by divorce, the *manus* still remained until put an end to by remancipation (on which the divorced wife was entitled to insist).

It has also been explained that the plebeians were in a very Mortis much worse position than the patricians in regard to their power of *causa* disposing of their estates in contemplation of death. Their elevation to the rank of citizens did not apparently give them admission *ance per* to the comitia of the curies; and, as it was many years after the *assassinatio* of Servius before the comitia of the centuries was *con-* libram. *vened*, they had still no means of making testaments unless perhaps in the field on the eve of battle. So here again the expedient of mancipation was taken advantage of, not indeed to make a testament instituting an heir, and to take effect only on the death of the testator,—the form of the transaction, as an instant acquisition in exchange for a price real or nominal, could not lend itself to that without statutory intervention—but to carry the transferor's *familia*¹ to a friend, technically *familiae emptor*, on trust to let the former have the use of it while he survived,² and on his death to distribute according to his instructions whatever the transferee was not authorized to retain for himself. Like so many others of the transactions of the early law, it was legally unprotected so far as the third parties were concerned whom the transferor meant to benefit; they had no action against the trustee to enforce the trust; their sole guarantee was in his integrity and his respect for fides.

Dionysius credits Servius with the authorship of more than fifty enactments relative to contracts and crimes, which he says were submitted to and approved by the assembly of the curies. The great majority of those so-called enactments were probably nothing more than formalizations of customary law, for the use of the private judges in civil causes whom the king is said to have instituted. There was one contract, however, notorious in after years under the name of *nexum*, that manifestly was influenced, either directly or tract indirectly, by his legislation. In its normal estate it was a loan of *per aes* money, or rather of the raw copper that as yet was all that stood *et libram*. for it. Whether before the time of Servius it was accompanied by any formalities beyond the weighing of it in a pair of scales (which was rather substance than form) we know not; and what right it conferred on the creditor over his debtor who failed to repay can only be matter of speculation. But there are indications that, in the exercise of undefined self-help, defaulters were treated with considerable severity, being taken in satisfaction and put in chains by their creditors; for Servius is reported to have promised to pay their debts himself in order to obtain their release, and to pass a law limiting execution by persons lending money at interest to the goods of their debtors. Whether he fulfilled the first part of his promise we are not informed; but the second part of it was impracticable, since a debtor's failure to repay a loan was in most cases attributable to his insolvency and want of means with which to satisfy his creditor. So, apparently, Servius had to be content with regulating and ensuring the publicity of the contract, and making a creditor's right of self-redress by apprehension (*manus injectio*) and confinement of his debtor conditional on the observance of the prescribed formalities of the *nexum*. These were the weighing of the copper that was being advanced in a pair of scales held by an official *libripens*; the reweighing of a single piece in the presence of five citizen witnesses, and its delivery by the lender as representing the whole; and the simultaneous recital of certain words of style, which had the effect of imposing on the borrower an obligation to repay the loan, usually with interest, by a certain day. The consequence of this, the earliest independent contract of the *jus civile*, is explained in p. 693.

Servian Amendments on the Course of Justice.—Of the course of justice in the regal period, whether in criminal or civil matters,

¹ The *familia* was the collective name for a man's *heredium* and other lands, with their slaves and other mancipable appurtenances—an aggregate of *res mancipi*, and therefore itself capable of mancipation. The conveyance was universal, i.e., the items of the aggregate, even though movable, did not require to be conveyed separately or to be handled in conveying; and apparently the *pecunia* was carried along with the *familia* as an accessory, at least if expressly mentioned.

² Sir Henry Maine (*Ancient Law*, p. 206) is of opinion that, as a mancipation could not be subject to a limitation either of condition or time, there must have been not only instant but total divestiture of the transferor. But that this was not necessarily the result is shown *infra*, p. 691.

Early
course
of justice.

before the time of Servius we know little that can be relied on. Antiquity used to speak of the king as having been generally supreme in both. But this can be accepted only with considerable reservation. For the *paterfamilias*, aided by a council in cases of importance, was judge within the family,—his jurisdiction sometimes excluding that of the state, at other times concurring with it, and not to be stayed even by an acquittal pronounced by it. He alone was competent in any charge against a member of the family for a crime or offence against the domestic order,—adultery or unchastity of wife or daughter, immorality of his sons, undutiful behaviour of children or clients; while there are instances on record of his interference judicially where an offence such as murder or theft had been committed by a member of his family against a stranger, and even when his crime had been treason against the state. Death, slavery, banishment, expulsion from the family, imprisonment, chains, stripes, withdrawal of *peculium*, were all at his command as punishments; and it may readily be assumed that in imposing them he was free to take account of moral guilt than an outside tribunal. The indications of criminal jurisdiction on the part of the *gens* are slight; but its organization was such that it is impossible not to believe that it must occasionally have been called on to exercise such functions. And it must not be lost sight of that, as murder seems to have been the only crime in regard to which private revenge was absolutely excluded, the judicial office of the kings must have been considerably lightened, public opinion approving and not condemning self-redress so long as it was kept within the limits set by usage and custom.

The boundary between civil and criminal jurisdiction, if it existed at all, was extremely shadowy. Theft and robbery, for example, if one may conclude from the position they held in the later jurisprudence, were regarded not as public but as private wrongs; and yet when a thief was caught plying his trade by night he might be slain, and when taken in the act by day might be sold as a slave. But in both cases it may also be assumed that a practice, afterwards formally sanctioned by the XII. Tables—that of the thief compounding for his life or freedom—was early admitted, and the right of self-redress thus made much more beneficial to the party wronged than when nothing was attained but vengeance on the wrongdoer. In assaults, non-manifest thefts, and other minor wrongs, self-interest would in like manner soon lead to the general adoption of the practice of compounding; what was originally a matter of option in time came to be regarded as a right; and with it there would be occasional difficulty in settling the amount of the composition, and consequent necessity of an appeal to a third party. Here seems to be the origin of the king's jurisdiction in matters of this sort. He was the natural person to whom to refer such a dispute; for he alone, as supreme magistrate, had the power to use coercion to prevent the party wronged insisting on his right of self-redress, in face of a tender by the wrongdoer of what had been declared to be sufficient reparation. But that self-redress was not stayed if the reparation found due was withheld; as the party wronged was still entitled at a much later period to wreak his vengeance upon the wrongdoer by apprehending and imprisoning him, it cannot reasonably be doubted that such also was the practice of the regal period.

How the kings acquired jurisdiction in questions of quiritarian right, such as disputes about property or inheritance, is by no means so obvious. Within the family, of course, such questions were impossible, though between clansmen they may have been settled by the *gens* or its chief. The words of style used in the sacramental real action (*infra*, p. 682) suggest that there must have been a time when the spear was the arbiter, and when the contending parties, backed possibly by their clansmen or friends, were actual combatants, and victory decided the right. Such a procedure could not long survive the institution of a state. In Rome there seems to have been very early substituted for it what from its general complexion one would infer was a submission of the question of right to the pontiffs as the repositories of legal lore. Their proper functions, however, were sacred. So, to bring what was a question of purely civil right within their jurisdiction, they engrafted on it a sacral element, by requiring each of the parties to make oath to the verity of his contention; and the point that in form they decided was which of the two oaths was false and therefore to be made atonement for. In substance, however, it was a finding on the real question at issue; and the party in whose favour it was pronounced was free to make it effectual if necessary by self-redress in the ordinary way.

Of Servius, Dionysius says—using, as he often does, language more appropriate to the republican than to the regal period—that he drew a line of separation between public and private judicial processes, and that, while he retained the former in his own hands, he referred the latter to private judges, and regulated the procedure to be followed in causes brought before them. Something of the sort was absolutely necessary. He was enormously increasing the number of the citizens,—that is to say, of those who were to enjoy in future the privileges of quiritarian right,—and multiplying the sources of future disputes that would have to be determined by the

tribunals. The nature of the provision made by him to meet the new aspect of things is much controverted; but we are disposed to credit him alike with the establishment of the collegiate court of the centumvirs and the institution of the single judge (*unus judex*).

The centumviral court and centumviral causes are often referred Centum. to by Cicero, and the range of their jurisdiction seems to have viral included every possible question of *manus* in the old sense of court. the word,—status of individuals, property and its easements and burdens, inheritance whether testate or intestate,—in other words, all questions of quiritarian right. By the time of Gaius the only matters apparently that were brought before it were questions of right to an inheritance of the *jus civile*; but the spear, the emblem of quiritarian right generally, was still its ensign.

That Servius should substitute for king and pontiffs a numerous court of citizens, originally, as there is reason to assume, all patricians, to try questions of quiritarian right on remit from himself, was quite in accordance with the general spirit of his reforms. It was not mere matters of personal dispute they had to decide, but they had to build up by their judgments a law which was to be of general and permanent application; and, as it was beyond the power of the king to overtake the task, what could be a more appropriate substitute than a court of his counsellors acting under pontifical guidance?

But there were many cases requiring judicial assistance in which Unus no question of quiritarian right had to be determined, but only judex. one of personal claim—of alleged indebtedness, whether arising out of a legal or illegal act, denied either *in toto* or only as to its amount. Matters of that sort were supposed to involve no general principle of law, but to be rather mere disputes or differences about facts, which could well be decided by a single judge. To meet their case the *unus judex* was introduced; he was appointed for each case as it arose, and acted really as the king's commissioner. This was the beginning of a system that bore wondrous fruit in after years, and that, as will be shown in the sequel, eventually displaced altogether the more imposing court of the centumvirs.

CHAPTER II.—THE JUS CIVILE.

(From the Establishment of the Republic until the Subjugation of Central and Southern Italy.)

I. FORMATIVE AGENCIES OF THE LAW.

The Legislative Bodies of the Period.—The limits and Ple- scope of this article do not permit of any detailed account beians' of the consequences of the change from kings to consuls, struggle or of the tribulations of the plebeians during the first two for equal- centuries of the republic. Stage by stage they fought ity. and conquered in the uphill battle for social and political equality. In 260 u.c. they got their own special protectors in their tribunes, with the *ædiles* as their assistants, and *judices decemviri* to act under their instructions as arbiters in disputes amongst themselves. In 283 they obtained state sanction for their *concilium*, and recognition of its power to regulate purely plebeian interests. The XII. Tables of 303 were the fruit of their agitation for a revision and written embodiment of the law. It was in deference to their complaints of their practical disfranchisement through the unduly preponderating influence of the patricians in the comitia of the centuries that in 305 the comitia of the tribes was instituted. Their repeated protests against the monopolization of the public domain land by members of the higher order resulted at last in the definite recognition of their right to participate in its occupation by one of the Licinian laws of 387. The long course of cruel oppression of plebeian insolvents by their patrician creditors was put an end to by the Poetilian law of 428 abolishing nexal contract, and prohibiting the use of chains and fetters on persons incarcerated for purely civil debt. By the Hortensian law of 467 the resolutions of the plebeian council (*plebiscita*) were declared binding not only on the plebeians themselves but on the whole body of the citizens. And from 333, when a plebeian first reached the magistracy through the quæstorship, down to 502, when they attained to the supreme pontificate, they gradually vindicated their right as citizens to share in all the honours and dignities of the state.

The legislative bodies were thus three in number,—the comitia of the centuries, the *concilium plebis*, and the

The king
as judge.

Servian
reforms.

Comitia
of the
centuries

comitia of the tribes. The first, if not organized by Servius Tullius, at all events grew out of his distribution of the populace into classes and centuries according to the value of their freeholds as appearing on the census-list. As just the national army assembled for a peaceful purpose (*exercitus civilis*), it could be convened and presided over originally only by a magistrate possessing the military *imperium*, i.e., a consul; but, after the creation of the censorship in 311 and the prætorship in 387, the holders of those offices were entitled to convoke it,—the former for its assent to arrangements for the census, and the latter for state trials. It was the centuries that passed the XII. Tables; but for the most part their legislation was upon questions affecting public and constitutional rather than private interests. The procedure in the centuriate comitia was somewhat cumbrous. There was publication of the proposed law (*promulgatio rogationis*) a fortnight before the day appointed, sometimes one or more meetings (*conciones*) being held in the interval for its consideration and discussion. When the day arrived, the *auspicia* were taken by the presiding magistrate, assisted by an augur; if favourable, the citizens were summoned anew by blast of trumpet, and on their assembling, which originally they did under arms, prayer and sacrifice were offered by president, pontiffs, and augurs. A final *concio* might then be held if thought necessary; and, after it was over, on the order to "proceed to the comitia," the citizens marched to the Campus Martius (the formal assembly being incompetent within the city). There the *rogatio* was read and, if no sign from heaven indicated the dissent of the gods and warned the assembly to disperse, was at once put to the vote—"Is it your pleasure, Quirites, to hold this as law?" The vote was taken by centuries, those of the knights and the freeholders of full valuation voting first; if they were unanimous it went no further, for these formed more than a majority of the whole *comitia*. The resolution, if adopted, was *poptuli jussum*, but not yet law. It had still to run the gauntlet of the "fathers,"—whether the senate or only its patrician members is disputed; it was in their power to refuse to authorize it (*auctores fieri*), usually putting their dissent on the ground that the gods willed it not; but if they ratified it, then it became a *lex*, ordinarily getting the name of the magistrate by whom it had been proposed. The power of veto, however, was considerably qualified by a Publilian law of the year 415, which enacted that in future the "fathers" should grant (or refuse) their *auctoritas* before the vote was taken.

Con-
cilium
plebis
and
comitia
of the
tribes.

The points of difference between the enactments of the *concilium plebis* and the later *comitia tributa* are indicated by Mommsen in a paper in his *Researches*.¹ (1) The *comitia* was an assembly of the whole body of the people, voting according to tribes instead of centuries; the *concilium* was an assembly of plebeians only, also voting *tributum*. (2) The *comitia* was convened and presided over by a patrician magistrate, not necessarily, however, with military *imperium*, and therefore very frequently by the prætor; whereas the *concilium* could be convened and presided over only by a plebeian official, either a tribune or an ædile. (3) In the *comitia* the *auspicia* had to be taken before the proceedings commenced; in the *concilium* the will of the gods was not demanded, although listened to if communicated in a thunder-storm or the like. (4) The resolution of the *comitia* required to be confirmed by the "fathers"; while that of the *concilium* did not. (5) An enactment of the *comitia* was a *lex*, and bound the whole people; but before the Hortensian law an enactment by the *concilium plebis* was in the ordinary case no

more than a *plebiscitum*, and of force only amongst the plebeians themselves. But there was an exception when, because of some constitutional change proposed by it, the senate had previously sanctioned the legislation, as in the case of the Terentilian law, which paved the way for the XII. Tables, of the Canuleian law authorizing the inter-marriage of patricians and plebeians, of the Licinian laws about the occupation of the public lands, &c.; in such cases, although the final vote was that of the *concilium*, the enactment was binding on the citizens generally, and was spoken of as a *lex* rather than as a *plebiscitum*. The latter name seems practically to have been dropped after the Hortensian law had equalized them so far as their effects were concerned. The greater part of the legislation for amending the private law latterly fell to the *concilium*, owing so far, perhaps, to the greater simplicity of its procedure, but also to some extent to the fact that the prætors preferred making their amendments tentatively by edicts (which were revocable), instead of embodying them in statutes, which, as passed under divine *auspices* and representing the divine will, could not easily be repealed.

The XII. Tables.—We have already shown the efforts made by Servius Tullius to secure that the dispensation of justice should neither be neglected nor left to caprice or hazard, one rule to-day and another to-morrow. With the consulate and the disregard of the "royal laws" and of Servius's instructions to the judges all this was changed. The consuls, with their harassing military engagements, could have little time to devote to their judicial functions or properly to instruct those to whom they delegated the duty of investigating and adjudicating on the merits of a complaint; and the yearly change of magistrates must itself have been a serious obstacle to uniformity either of rule or practice so long as the law rested on nothing but unwritten custom. One can well believe too, when feeling was so embittered between the orders, that it was no rare thing for a consul to use his magisterial punitive powers (*coercitio*) with undue severity when a plebeian was the object of them, or to turn a deaf ear to an appeal for justice addressed to him from such a quarter. The state of matters had become so intolerable that in the year 292 the demand was made by C. Terentilius Arsa, one of the tribunes, that a commission should be appointed to define in writing the jurisdiction of the magistrates, so that a check might be put on their arbitrary, high-handed, and oppressive administration of what they were pleased to call the law. His colleagues induced him for the moment not to press his demand, which he was urging with a violence of invective that was unlikely to promote his object. But next year they made common cause with him, requiring that the whole law, public and private, should be codified, and its uncertainty thus as far as possible be removed. After a few years' resistance the senate was induced to give its assent to a demand that in itself was too reasonable to be longer withstood.

The first practical step towards its realization was the despatch of a mission to Greece and the Greek settlements in southern Italy, to study their statute law and collect any materials that might be of service in preparing the projected code. On the return of the ambassadors in 302 all the magistracies were suspended, and a commission of ten patricians (*decemviri legibus scribundis*) was appointed with consular powers, under the presidency of Appius Claudius, for the express purpose of reducing the laws to writing. Before the end of the ensuing year (303) the bulk of the code was ready, and was at once passed into law by the comitia of the centuries, and engraved or perhaps painted on ten tables of wood, which were exposed in the Forum. Next year the decemvirate was renewed

¹ "Die Sonderversammlungen der Plebs," in his *Röm. Forschungen*, vol. i., Berlin, 1864, p. 177 sq.

with a slight change of *personnel*, but under the same presidency as before; and in the course of a few months it had completed the supplemental matter, which was passed in due form, and displayed on two other tables, thus bringing the number up to twelve and giving the code its official name of *Lex XII. Tabularum*.

Sources. There were provisions in them that were almost literal renderings from the legislation of Solon; and others bore a remarkable correspondence to laws in observance in Greece, but there is no authority for saying they were directly borrowed. By far the greater proportion of them, however, were native and original,—not that they amounted to a general formalization of the hitherto floating customary law, for, notwithstanding Livy's eulogium of them as the "fountain of the whole law, both private and public," it seems clear that many branches of it were dealt with in the Tables only incidentally, or with reference to some point of detail. The institutions of the family, the fundamental rules of succession, the solemnities of such formal acts as mancipation, *nexum*, and testaments, the main features of the order of judicial procedure, and so forth,—of all of these a general knowledge was presumed, and the decemvirs thought it unnecessary to define them. What they had to do was to make the law equal for all, to remove every chance of arbitrary dealing by distinct specification of penalties and precise declaration of the circumstances under which rights should be held to have arisen or been lost, and to make such amendments as were necessary to meet the complaints of the plebeians and prevent their oppression in the name of justice. Nothing of the customary law, therefore, or next to nothing, was introduced into the Tables that was already universally recognized, and not complained of as either unequal, indefinite, defective, or oppressive. Only one or two of the laws ascribed to the kings reappeared in them, and that in altered phraseology; yet the omission of the rest did not mean their repeal or imply denial of their validity, for some of them were still in force in the empire, and are founded on by Justinian in his *Digest*. Neither were any of the laws of the republic anterior to the Tables embodied in them, although for long afterwards many a man had to submit to prosecution under them and to suffer the penalties they imposed. In saying, therefore, that for the most part the provisions of the decemviral code were of native origin, all that is meant is that they were the work of the decemvirs themselves, operating upon the hitherto unwritten law in the directions already indicated.

Remains. The original Tables are said to have been destroyed when Rome was sacked and burned by the Gauls. But they were at once reproduced, and transcripts of them must have been abundant if, as Cicero says was still the case in his youth, the children were required to commit them to memory as an ordinary school task. This renders all the more extraordinary the fact that the remains of them are so fragmentary and their genuineness in many cases so debatable. They were embodied in the *Tripartita* of Sextus Ailius Papius in the year 557; they must have formed the basis of all the writings on the *jus civile* down to the time of Servius Sulpicius Rufus (who first took the prætor's edicts as a text); and they were the subjects of monographs by a number of authors of distinction, amongst them by M. Antistius Labeo in the early years of the empire and by Gaius probably in the reign of Hadrian. Yet a couple of score or so are all that can be collected of their provisions in what profess to be the *ipsissima verba* of the Tables,—though in a form in most cases more modern than what we encounter in other remains of archaic Latin. These are contained principally in the writings of Cicero, the *Noctes Atticæ* of Aulus Gellius, and the treatise *De verborum significatione* of Festus, the last two dealing with them rather as matters of antiquarian curiosity than as rules of positive law. There are many allusions to particular provisions in the pages of Cicero, Varro, Gellius, and the elder Pliny, as well as in those of Gaius, Paul, Ulpian, and other ante-Justinian jurists; but these are not implicitly to be relied on, as we have evidence that they frequently represent the (sometimes divergent) glosses of the interpreters rather than the actual provisions of the statute. Reconstruction has therefore been a work of difficulty, and the results far from satisfactory, that of the latest editor, Voigt, departing very considerably from the versions generally current during the last half century.¹

¹ Dirksen's *Uebersicht der bisherigen Versuche zur Kritik u. Herstellung d. Zwölftafel-Fragmente*, Leipzig, 1824, supplies the basis of all the later work on the Tables anterior to that of Voigt. Schoell, in his *Legis XII. Tab. reliquiae*, Berlin, 1866, made a valuable contribution to the literature of the subject from a philological point of view. His version has been adopted substantially by Bruns in his *Fontes juris romani antiqui*, and by Wordsworth in his *Fragments and Specimens of Early Latin*, Oxford, 1874, p. 253 sq. The latter, in a subsequent part of his volume (pp. 502-538), has added notes, historical, philological, and exegetical, which constitute a valuable commentary on the Tables as a whole. Voigt's two volumes, under the title of *Geschichte und System des Civil- und Criminal-Rechtes, wie*

In form the laws contained in the Tables were of remarkable General brevity, terseness, and pregnancy, with something of a rhythmical cadence that must have greatly facilitated their retention in the memories. Here and there the rules they embodied were potestative; but for the most part they were peremptory, running on broad lines, surmounting instead of removing difficulties. Their application might cause hardship in individual instances, as when a man was held to the letter of what he had declared in a *nexum* or mancipation, even though he had done so under error or influenced by fraudulent misrepresentations; the decemvirs admitted no exceptions, preferring a hard-and-fast rule to any qualifications that might cause uncertainty. The system as a whole is one of *jus* as distinguished from *fas*. In the royal laws execration (*saceratio capitis, sacer esto*) was not an uncommon sanction; but in the Tables it occurs only once pure and simple, and that with reference to an offence that could be committed only by a patrician,—material loss caused by a patron to his client (*patronus, si clienti fraudem fecerit, sacer esto*). In all other cases the idea that a crime was an offence against public order, for which the community was entitled in self-protection to inflict punishment on the criminal, is as prominent as the older one that it was a sin against the gods, to be expiated by dedication of the sinner to the divinity more especially outraged by his offence. Hanging and beheading, flogging to death, burning at the stake, throwing from the Tarpeian rock,—such are the secular penalties that are met with in the Tables; but often, though not invariably, the hanging and so forth is at the same time declared a tribute to some deity to whom the goods of the criminal are forfeited (*consecratio bonorum*).

It is not unworthy of notice that traces remained in the Tables of the old system of self-help. The *manus injectio* of the third Table—the execution done by a creditor against his debtor—was essentially the same procedure as under the kings, but with the addition of some regulations intended to prevent its abuse. Against a thief taken in the act something of the same sort seems still to have been sanctioned; while it was still lawful to kill him on the spot if the theft was nocturnal, or even when it was committed during the day if he used arms in resisting his apprehension. According to Cicero there was a provision in these words—"si telum manu fugit magis quam jecit, arietem subicito"; this is just a re-enactment in illustrative language of the law attributed to Numa, that for homicide by misadventure—"if the weapon have sped from the hand rather than been aimed"—a ram was to be tendered as a peace-offering to the kinsmen of him who had been slain. The original purpose must have been to stay the blood revenge, and it may even have been so with Numa; but in the Tables it can only have been intended to stay the prosecution which it was incumbent on the kinsmen of a murdered man to institute. So with talionic penalties: "si membrum rupit, ni cum eo pacit, talio esto"—such, according to Gellius, were the words of one of the laws of the Tables, and they undoubtedly contain a reminiscence of a time when talion was recognized, "an eye for an eye, a tooth for a tooth"; but in the mouths of the decemvirs they were nothing more than a clumsy mode of enabling an injured man to exact the greatest money recompense he could, and to have it measured according to the position and fortune of the individual who had done him injury.

The structure of the provisions of the Tables was not such as to Inter- enable the plain citizen to apply them to concrete cases, or know pretation how to claim the benefit of them in the tribunals, without some of the sort of professional advice. Pomponius states that no sooner was Tables the decemviral legislation published than the necessity was felt for its interpretation, and for the preparation by skilled hands of styles of actions by which its provisions might be made effectual. Both of these duties fell to the pontiffs as the only persons who, in the state of civilization of the period, were well qualified to give the assistance required; and Pomponius adds that the college annually appointed one of its members to be the adviser of private parties and of the *judices* in those matters. The *interpretatio*, commenced by the pontiffs and continued by the jurists during the republic, which, Pomponius says, was regarded as part of the *jus civile*, was not confined to explanation of the words of the statute, but was in some cases their expansion, in others their limitation, and in many the deduction of new doctrines from the actual *jus scriptum*, and their development and exposition. An event that did much to diminish the influence of the pontiffs in connexion with it was the divulgement in the year 450 by Cn. Flavius, secretary of Appius Claudius Cæcus, and probably at his instigation, of a formulæ of actions and a calendar of lawful and unlawful days, which got the name of *Jus Flavianum*. The practice adopted in the beginning of the 6th century by Tiberius Coruncanian, the

-Processes, der XII. Tafeln, nebst deren Fragmenten, Leipzig, 1883, contain an exposition of the whole of the earlier *jus civile*, whether embodied in the Tables or not. The history of them occupies the first hundred pages or thereby of the first volume; his reconstruction of fragments and allusions—a good deal fuller than any earlier one, and supported by an imposing array of authorities—is in the same volume, pp. 693-737.

first plebeian chief pontiff, of giving advice in law in public had a still greater effect in popularizing it; and the *Jus Aelianum*, some fifty years later—a collection that included the Tables, the *interpretatio*, and the current styles of actions—made it as much the heritage of the laity as of the pontifical college.

Subsequent legislation.

Subsequent Legislation.—Of legislation during the fourth and fifth centuries that affected the private law we have but scanty record. The best-known enactments are the Canuleian law of 309 repealing the decemviral prohibition of marriages between patricians and plebeians; the Genucian, Marcian, and other laws about usury and the rate of interest; the Poetilian law of 428, abolishing the nexal contract; the Silian law, probably not long afterwards, which introduced a new form of process for actions of debt and appears to have given statutory sanction to the stipulation (in its earliest form of *sponsio*); and the Aquilian law of 467, which amended the decemviral provisions about actions of damages for culpable injury to property, and continued to regulate the law on the subject even in the books of Justinian.

II. THE ACTIONS OF THE LAW.

Legis actiones generally.

*The Legis Actiones generally.*¹—We owe to Gaius the only connected (though, owing to the state of the Verona MS., rather fragmentary) account we possess of the *legis actiones*, as the system of judicial procedure was called which prevailed in Rome down to the substitution of that *per formulas* by the Æbutian and Julian laws,—the first early in the sixth century of the city, and the second in the age of Augustus. He tells us that as *genera agendi* or generic forms of process they were five in number, each taking its name from its characteristic feature, viz., (1) *sacramento*, (2) *per judicis postulationem*, (3) *per condictionem*, (4) *per manus injectionem*, and (5) *per pignoris capionem*. The third was unknown in the decemviral period, and was introduced by the Silian law alluded to in last paragraph. The other four were all more or less regulated by the XII. Tables, but must in some form have been anterior to them. It is utterly impossible, however, to say of any one of them at what time it was introduced, or what was the statute (*lex*) by which it was sanctioned; it may well be that they were not of statutory introduction at all, but were called *legis actiones* simply because recognized and indirectly confirmed by the Tables. In character and purpose they were very different. The first three were directly employed for determining a question of right or liability, which, if persistently disputed, inevitably resulted in a judicial inquiry. The fourth and fifth might possibly result in judicial intervention; but primarily they were proceedings in execution, in which the party moving in them worked out his own remedy. As regards their comparative antiquity there is much to be said for the opinion of Ihering and Bekker that *manus injectio*, as essentially nothing more than regulated self-help, must have been the earliest of the five, and that the *legis actio sacramento* and the *judicis postulatio* must have been introduced in aid of it, and to prevent too hasty resort to it where there was room for doubt upon question either of fact or law.

In the three judicial *legis actiones* the first step was the *in jus vocatio* or procedure for bringing the respondent into court, minutely

regulated by the provisions of the first of the XII. Tables. This duty was not committed to any officers of the law; there was no writ of summons of any sort; the party moving in the contemplated litigation had himself to do what was needed. Once before the magistrate (consul or prætor), the plaintiff stated his contention. If admitted unqualifiedly by the defendant, the magistrate at once pronounced his decree, leaving the plaintiff to work out his remedy as the law prescribed. But, if the case presented was met either with a denial or a qualified defence, and appeared to the magistrate to be one proper for trial, he remitted it for that purpose either to the centumviral tribunal or to one or more private citizens as judges or arbiters. The act of remit was technically *litis contestatio* or *ordinatio judicii*, the first so named because originally the parties called upon those present to be witnesses to the issue that was being sent for trial. This was the ordinary practice under both the system of the *legis actiones* and that of the *formulae*, and prevailed until the time of Diocletian. In the first stage the proceedings were said to be *in jure*, and the duties of the magistrate in reference to them made up his *jurisdictio*; in the second they were said to be *in judicio*, those presiding in it being styled *judices*. All that the judge or judges had to do was to pass judgment on the question remitted to them. They were "right-declarers" only, not "right-enforcers." If their judgment was for the plaintiff, and he failed to obtain an amicable settlement, he had himself to make it operative by subsequent proceedings by *manus injectio*, and that under the eye of the magistrate, not of the judge.

From an enumeration in Cicero of a variety of causes proper to the centumviral court the conclusion seems warranted that it was its peculiar province to decide questions of quiritary right in the strictest acceptance of the word. They were all apparently real actions (*vindicationes*),—claims of property in land or of servitudes over it, of right as heir under a testament or in opposition to it, of rights of tutory and succession *ab intestato* as agnate or gentile, and so forth. In all these it was a numerous court of Quirites, advised in the early republic by a pontiff, that determined by its vote the question of quiritary right submitted to it. Many such questions in course of time, and possibly at first of express consent of parties, came to be referred to a single judge; but some, and notably claims of inheritance under or in opposition to a testament, were still remitted to the centumviral court in the classical period. Personal actions, however, do not appear ever to have fallen within its cognizance: they were usually sent to a single judge—a private citizen—selected by the parties, but appointed by the magistrate, and to whom the latter administered an oath of office. But, in a few cases in which an action involved not so much a disputed question of right as the exercise of skill and discretion in determining the nature and extent of a right that in the abstract was not denied, the remit was to a plurality of private judges or arbiters, usually three.

*The Legis Actio Sacramento.*²—The characteristic feature *Sacramento* of this *legis actio*, as described by Gaius, was that the parties, after a somewhat dramatic performance before the consul or prætor, each challenged the other to stake a certain sum, the amount of which was fixed by the Tables, and which was to abide the issue of the inquiry by the court or judge to whom the cause was eventually remitted. This stake Gaius refers to indifferently as *sacramentum*, *summa sacramenti*, and *poena sacramenti*. The formal question the court had to determine was,—whose stake had been justified, whose not (*cujus sacramentum justum, cujus injustum*); the first was returned to the staker, the second forfeited originally to sacred and afterwards to public uses. But the decision on this formal question necessarily involved a judgment on the matter actually in dispute, and, if it was for the plaintiff, entitled him, failing an amicable arrangement, to take ulterior steps for making it effectual. The procedure was still employed in the time of Gaius in the few cases

¹ The literature on the subject is very voluminous, great part of it in periodicals. Amongst the leading works are those of Keller, *Der röm. Civilprocess u. die Actionen*, 1st ed. 1852, 6th ed. by Wach, Leipzig, 1883, §§ 12-21; Bethmann-Hollweg, *Der röm. Civilprocess in seiner geschichtl. Entwicklung*, 3 vols., Bonn, 1864-66, the first volume of which is devoted to the *legis actiones*; Buonamici, *Delle Legis Actiones nell' antico diritto romano*, Pisa, 1868; Bekker, *Die Aktionen d. röm. Privatrechts*, 2 vols., Berlin, 1871-73, particularly vol. i. pp. 18-74; Karlowa, *Der röm. Civilprozess zur Zeit d. Legisactionen*, Berlin, 1872; Padeletti, "Le Legis Actiones," in the *Archivio Giuridico*, vol. xvii. (1875), p. 321 sq. Schultze, *Privatrecht u. Process in ihrer Wechselbeziehung*, vol. i., Freiburg, 1883 (vol. ii. not yet published), in pp. 439-532 presents some novel and not unimportant views.

² To the literature in the last note may be added Asverus, *Die legis actio sacramenti*, Leipsic, 1837; Huschke (rev. Asverus), in Richter's *Krit. Jahrbuch*, vol. iii. (1839), p. 665 sq.; Stintzing, *Verhältnisse d. l. a. sacramento zum Verfahren durch sponsio præjudicialis*, Heidelberg, 1853; Danz, *Der sacrale Schutz*, pp. 151-221; Maine, *Ancient Law*, p. 375 sq.; Danz, "Die l. a. Sacram. u. d. Lex Papiria," in the *Zeitschr. f. Rechtsgeschichte*, vol. vi. (1867), p. 339 sq.; Huschke, *Die Multa u. d. Sacramentum*, Leipsic, 1874; Lotmar, *Zur l. a. sacramento in rem*, Munich, 1876; Brinz (crit. Lotmar), "Zur Contravindication in d. l. a. sacr.," in the *Festgabe zu Spengel's Doctor-Jubiläum*, Munich, 1877, pp. 95-146; Münderloh, "Ueber Schein u. Wirklichkeit an d. l. a. sacramenti," in the *Z. f. Rechtsgesch.*, vol. xiii. (1878), p. 445 sq.; E. Roth, in the *Z. d. Savigny Stiftung*, vol. iii. (1882), *Röm. Abtheil.*, p. 121 sq.; Fioretti, *Leg. act. sacramento*, Naples, 1883; Ihering, "Reich u. Arm im altröm. Civilprozess," in his *Scherz u. Ernst in der Jurisprudenz*, Leipsic, 1885, p. 175 sq.

that continued to be referred to the centumviral court, but otherwise it had been long in disuse.

Gaius explains that it was resorted to both in real and personal actions. Unfortunately the MS. of his *Institutes* is defective in the passage in which he described its application to the latter. We possess the greater part of his account of the *actio in rem* as employed to raise and determine a question of ownership; but his illustration is of vindication of a slave, and not so interesting or instructive as the proceedings for vindication of land. These, however, can be reconstructed with tolerable certainty with the aid derived from Cicero, Varro, and Gellius.

The parties appeared before the magistrate, each armed with a rod (*festuca*) representing his spear (*quir* or *hasta*), the symbol, as Gaius says, of quiritarian ownership. The first word was spoken by the raiser of the action, and addressed to his opponent: "I say that the land in question [describing it sufficiently for identification] is mine in quiritary right (*meum esse ex jure quirittum*); wherefore I require you to go there and join issue with me in presence of the magistrate (*in jure manum conserere*)."¹ Thereupon, according to the earliest practice, the magistrate and the parties, accompanied by their friends and backers, proceeded to the ground for the purpose: the court was transferred from the forum to the land itself. As distances increased, however, and the engagements of the consuls multiplied, this became inconvenient. Instead of it, this course was adopted: the parties went to the spot without the magistrate, but on his command, and there joined issue in the presence of their seconds, who had been ordered to accompany them, and who probably made a report of the due observance of formalities on their return. Still later the procedure was further simplified by having a turf brought from the place beforehand—probably as time advanced there would be no very particular inquiry as to where it had been obtained—and deposited a few yards from the magistrate's chair; and, when he ordered the parties to go to the ground and join issue, they merely brought forward the turf and set it before him, and proceeded to make their formal vindications upon it, as representing the whole land in dispute.

The ritual was as follows. The raiser of the action, addressing his adversary, again affirmed his ownership, but this time with the significant addition—"As I have asserted my right by word of mouth, look you, so do I now with my *vindicta*"; and therewith he touched the turf with his rod, which was called *vindicta* when employed for this purpose. The magistrate then asked the other party whether he meant to counter-vindicate. If he replied in the negative or made no response, there was instant decree (*addictio*) in favour of the first party, and the proceedings were at an end. If, however, he counter-vindicated, it was by repeating the same words and re-enacting the same play as his adversary:—"I say that the land is mine in quiritary right, and I too lay my *vindicta* upon it." The verbal and symbolical vindication and counter-vindication completed what was technically the *manus consortio*. The parties were now in this position: each had asserted his ownership, and had figuratively had recourse to arms in maintenance of his contention. But the matter was to be settled judicially, so the magistrate once more intervened and ordered both to withdraw from the land. The dialogue was then resumed, the vindicant demanding to know from his opponent upon what pretence (*causa*) he had counter-vindicated. In the illustration in Gaius he avoided the question and pleaded the general issue,—"I have done as is my right in laying my *vindicta* on the land." But there can be little doubt that in certain circumstances the counter-vindicant would deem it expedient to disclose his title. This was very necessary where he attributed his right to a conveyance upon which two years' possession had not yet followed; in such a case he had to name his author (*auctorem laudare*) if he desired to preserve recourse against the latter on the warranty implied in the mancipation. That probably entailed a suspension of the proceedings to allow of the author's citation for his interest; and on their resumption, if he appeared and admitted his *auctoritas*, he was formally made a party to the action.

The proceedings had now reached the sacramental stage proper. The first challenge came from the vindicant,—"Since you have vindicated unrightfully, I challenge you with a sacrament of 500 *asses*," to which the counter-vindicant responded,—"And I you." This was technically the *sacramento provocatio*. The magistrate thereupon remitted the matter for trial to the centumviral court, or possibly, in certain cases, to a single judge, and in the presence of witnesses called by the parties (*libis contestatio*) declared what exactly was the question put in issue which the court or judge was to decide. At the same time, according to Gaius's account of the procedure, he required sureties from the parties for the eventual payment by him who was unsuccessful of the sacrament he had offered to stake, and which became a forfeit to the exchequer. (The original practice was for the stake to be deposited by both parties

in the hands of the pontiffs before they were heard by the centumviral court; after judgment that of the gainer was reclaimed by him, while that of the loser was retained for religious uses.) The magistrate also made arrangements for the interim possession of the land by one or other of the litigants, taking security from him that, if he was eventually unsuccessful, it should be returned to his opponent, along with all the fruits and profits drawn in the interval. At the trial, as both parties were vindicants, there must have been a certain burden of proof upon both sides. The vindicant, one may believe, must have been required to establish in the first instance that the thing he claimed had at some time been his; and then, but probably not till then, the counter-vindicant would have to prove a later title in his person sufficient to exclude that of his opponent. The judgment, as already observed, necessarily involved a finding on the main question; but in form it was a declaration as to the sacrament: that of the party who prevailed was declared to be just, and that of his unsuccessful opponent unjust.

Looking at this ritual as a whole the conviction is irresistible that it could not have been so devised by one brain. It reveals and combines three distinct stages in the history of procedure,—appeal to arms and self-help, appeal to the gods and the spiritual power, appeal to the civil magistrate and his judicial office. As Gellius says, the real and substantial fight for might, that in olden days had been maintained at the point of the spear, had given place to a civil and festucarian combat in which words were the weapons, and which was to be settled by the interposition of the prætor. But this does not explain the *sacramentum*. Very various theories have been proposed to account for it. According to Gaius, it was nothing more than the sum of money staked by each of the parties, which was forfeited originally to sacred and afterwards to public uses by him who was unsuccessful, as a penalty for his rashly running into litigation; and substantially the same explanation is given by Festus in one of his definitions of the word. But this is far from satisfactory; for it involves the absurdity of declaring that a penalty imposed by law could be unjust (*injustum*) in any case, and the still greater absurdity of declaring it just in the case of the party who was in the right, and unjust in the case of him who was in the wrong. There is another definition in Festus—"a thing is said to be done *sacramento* when the sanction of an oath is interposed"—which lends support to the opinion that there was a time when parties to a question of right were required to take an oath to the verity of their respective assertions; that they were also required concurrently to deposit five bullocks or five sheep, according to the nature or value of the thing in dispute, to abide the issue of the inquiry;¹ that the question for determination was whose oath was just and whose unjust; and that he who was found to have sworn unjustly forfeited his cattle or sheep as a *piamentum*—a peace-offering to the outraged deity—while the other party reclaimed his from the repository in which they had been detained in the interval.²

¹ It was the *Lex Aternia Tarpeia* of the year 300 u.c. that committed the five bullocks and five sheep into 500 and 50 lb of copper respectively (Cic., *De Rep.*, ii. 35, § 60, where the words usually printed "de multae sacramento" should read "de multa et sacramento"); Fest., s.v. "Peculatus" (Bruns, *Fontes*, p. 279). For the pounds' weight of raw metal the XII. Tables substituted the same number of *asses*, declaring that 500 should be the *summa sacramenti* when the cause of action was worth 1000 *asses* or more, 50 when worth less or the question one of freedom or slavery (Gai., iv. 14).

² Varro, *De L. L.*, v. 180 (Bruns, p. 303), says that, even after the *summa sacramenti* had been converted into money, it was deposited *ad pontem*,—some bridge, he does not say which, where there was a sacred "pound." (Curiously enough, the Irish spelling of "pound" is "pont"; Skeat's *Etym. Dict.*, s.v. "Pound.") A most ingenious and plausible explanation was suggested by Danz in 1867, in the *Zeitschr. f. Rechtsgesch.*, vol. vi. p. 359. Recalling the facts that there had been discovered in the Tiber Island *sacella* of Jupiter Jurarius and Dios Fidius, the two deities to whom solemn oaths were usually addressed, and that the island was spoken of as "inter duos pontes," because connected with both banks of the river by bridges bearing no particular names, he suggested that the island may have been the place to which disputants resorted to make their *sacramenta*, and that the cattle, sheep, or money were deposited in a place for the purpose before the bridge was crossed. Much the same explanation was offered by Huschke two years later in his book *Das alte römische Jahr* (Breslau, 1869), p. 360, apparently without being aware of Danz's speculation. He adds, on the authority of the Iguvine Tables, that, while bullocks were offered to Jupiter, only sheep were offered to Dios Fidius. The island, he thinks, must have been selected as neutral ground to which all parties might have access, and which obviated intrusion into the temples of the two gods on the Capitol and Quirinal respectively. And it is to its use as the scene of the sacramental procedure that he attributes its name of "holy island," rather than to the fact of its having been the seat of the temple of Æsculapius. Huschke recurs to and enforces this view in his *Multa und Sacramentum* (1874), p. 410, where he does refer to Danz's paper.

The writers who adopt this view are far from being unanimous as to details. But there seems to be enough to render it more than probable that, at an intermediate stage between the *vera solida vis* of ancient times and the *vis civilis et festuaria* which Gellius and Gaius depict, there was a procedure by appeal to the gods through means of oaths of verity sworn by the parties, in the manner and with the consequences that have been indicated. That in time it should have dropped out of the ritual is quite in the order of things. Its tendency was to become a mere form, imposing no real restraint on reckless litigation. The restraint was rather in the dread of forfeiture of the sacramental cattle, sheep, or money that would follow a verdict that an oath had been unjust. And it must have been felt besides that it was unfair to brand a man as a false-swearer, needing to expiate his offence by an offering to the gods, whose oath had been perfectly honest. That he should suffer a penalty for his imprudence in not having taken more care to ascertain his position, and for thus causing needless annoyance to others, was reasonable, but did not justify his being dealt with as one who had knowingly outraged the deity to whom he had appealed. So the oath—the original *sacramentum*—disappeared, the name passing by a natural enough process to the money which had been wont to be deposited before the oath was sworn, but which now ceased to be an offering in expiation by a false-swearer, and became a mere penalty of rash litigation (*poena temere litigantis*).

It may be assumed that in most cases the finding of the centumvirs as to the justness or unjustness of the respective sacraments of the parties was the end of the case,—that it was at once accepted and loyally given effect to. Festus, however, preserves a law of the XII. Tables which, according to Mommsen's rendering, declared that, when it turned out that interim possession had been awarded to the wrong party, it was to be in the latter's power to demand the appointment of three arbiters who should ascertain the value of the object of vindication and its fruits, and assess the damages due for non-restitution at double the amount. This provision seems to have been intended to afford the wrongful interim possessor, who was not in a position to make specific restitution to his successful opponent, a means of avoiding the apprehension and imprisonment which were the statutory consequences of failure to implement a judgment. It is probable that in time this duplicated money payment came to be regarded as the satisfaction to which the successful party in a vindication was entitled in every case in which, no matter for what reason, he was unable to obtain the thing itself and its fruits from their interim possessor; that consequently an *arbitrium litis aestimandae*, or reference to arbiters to assess their value, resulted in every such case; and that it was to assure its payment that the prætor required the party to whom the interim possession was awarded to give to his opponent the sureties (*prædes litis et vindictiarum*) to whom Gaius alludes.

After this explanation of the procedure in the sacramental action for vindication of land it is unnecessary to enter into any detail of what was done when it was a movable that was being vindicated, or when the action was a personal one for payment of money. The real action about a movable was of course simpler than that described; for the thing was always *in præsentia*. As regards personal actions, the ordinarily received opinion, which rests, however, on slender foundations, is that from the first the parties met on equal terms; that, if it was a case of money debt, the creditor commenced the proceedings with the averment that the defendant owed him the sum in question,—“I say that you ought to pay me (*dare oportere*) 1000 asses”; that this was met with a denial; and that a sacramental challenge followed on either side. All are agreed that the remit was to a single *judex* after an interval of thirty days from the proceedings *in jure*; that where the claim was for a definite sum the plaintiff had to establish his case to the letter; and that his sacrament was necessarily declared unjust if he failed to prove his claim by a single penny. But there is considerable diversity of opinion as to whether by this form of process a claim of uncertain amount could be insisted on,—as, for example, for damages for breach of a warranty of acreage of lands sold, or of their freedom from burdens. If it could, then probably the question raised and dealt with *sacramento* was the abstract one of liability,—Was the warranty given, and has it failed? the sum due in respect of the breach being left to be dealt with in a subsequent arbitral process (*arbitrium litis aestimandae*).

*The Legis Actio per Judicis Postulationem.*¹—The defects of the Verona MS. have deprived us of Gaius's account of this *legis actio*. There is little elsewhere that can with any certainty be said to bear upon it. The most important is a note in Valerius Probus—*T.P.R.I.A.V.P.V.D.*,

which is generally interpreted—*te, prætor, judicem arbitrumve postulo uti des*. This petition to the magistrate—king, consul, prætor—to appoint a judge, arbiter, or arbiters (as the case might be) in all probability was part of the procedure in the action, and that from which it derived its distinctive name. Beyond this all is conjecture, alike as to the nature and form of the action and the cases to which it was applicable. Gaius says of the *legis actio sacramento* that it was general, and that it was the procedure that was to be resorted to where no other was prescribed by statute. The extant fragments of the XII. Tables contain no such indications as this would lead us to expect; there is not a hint in them of an express instruction that proceedings in any particular case were to be *per judicis postulationem*.

While it is impossible with certainty to trace the history of this procedure to its first beginnings, yet the impression is general that it must have originated in the regal period. There were three different positions in which an appeal for aid might be made to a court of justice,—(1) when it was a question of civil right that had to be decided in terms directly affirmative or directly negative of the contention of the raiser of the action, and one in which questions of both law and fact were involved; (2) when it was only a question of fact that had to be ascertained,—the legal result of the fact, if established, being known beforehand; (3) when facts had to be set against facts, and a result arrived at that in the judgment of those who had to balance them was fair and reasonable in the circumstances. In the first case, as when the contention was *meum esse* or *dari oportere* (otherwise than under an obligatory *nezum*), the procedure was *sacramento* and the reference originally (in all probability) to the pontiffs, although afterwards to the centumviral court or to a *judex*; in the second, as when the question was—had or had not the defendant assaulted the plaintiff, and so incurred the invariable statutory penalty, the reference was probably to a *judex* without the intervention of a sacrament; in the third, as when the matter in hand was the partitioning of an inheritance amongst co-heirs, or the determining whether operations of the defendant were interfering with the natural drainage of the plaintiff's land and how the mischief was to be abated, or the assessment of damages for injury to property, or of the sum sufficient to relieve from talion or the statutory penalty of theft, the reference was to an arbiter or arbiters. In the procedure *sacramento* the pleadings opened directly with an averment of right—“I say that this is mine,” “I say that the defendant is bound to pay me so much”; but in that *per judicis arbitrive postulationem* there is reason to surmise that they commenced with an averment of fact, followed by the resulting demand of the plaintiff. The details, however, are quite uncertain, with the exception that in some *arbitria* the plaintiff expressly threw himself upon the discretion of the arbiters—*quantum æquius melius est ob eam rem mihi dari*.

The Legis Actio per Condictioem.—This the youngest *Per con-*
“action of the law” was introduced, Gaius says, by the *dictio-*
Silian law as a means of recovering a liquid money debt *em.*
(*certa pecunia*), and afterwards made available by the Calpurnian law for enforcing personal claims (as distinguished from real rights) for anything else definite and certain (*omnis res certa*), and in both its forms, therefore, essentially an action of debt. The date of both enactments is matter of controversy, although there is no question that the Silian was the earlier. Gaius says of it that its purpose was far from obvious, as there was no difficulty in recovering money either by a sacramental action or one *per judicis postulationem*. He overlooks the fact that money due under a pænal contract was recoverable by neither of these processes, but by the much more summary one of *manus injectio*. By the Pœtilian law of 428 this was declared unlawful. We are disposed to regard the *Lex Silia* and the new procedure it authorized as a result of the change. To have put off a creditor for money lent either with a sacramental action or one *per judicis postulationem* would have been to deprive him of the advantages of *manus injectio* to a greater extent than was called for. So it was provided by the Silian law that, when a man disputed his liability for what was called *pecunia certa credita*, and forced his creditor to litigation, not only was the defendant bound in the first place either to deny his

Per
judicis
postula-
tionem.

¹ To the literature on p. 681, note 1, add Baron, “Zur leg. act. per judicis arbitrive postulationem,” in the *Festgabe für Aug. W. Heffter*, Berlin, 1873, p. 29 sq.; Huschke, *Multa*, &c., p. 394 sq.; Adolf Schmidt, “Ueber die l. a. per jud. post.,” in the *Zeitschr. d. Sav. Stift.*, vol. ii. (1881), *Röm. Abtheil.*, p. 145 sq.; Voigt, *XII. Tafeln*, vol. i. § 61.

liability under oath or else to pay the sum claimed; but if he did deny it the plaintiff was entitled to require from him an engagement to pay one-third more by way of penalty in the event of judgment being against him, while the *soi-disant* creditor had to give an engagement to pay as penalty the same amount in case of judgment in favour of the alleged debtor. These engagements (*sponsio et restipulatio tertiæ partis*) were not allowed in every case in which a definite sum of money was claimed *per condictionem*, but only when it was technically *pecunia credita*. In Cicero's time *credita* might arise either from loan, stipulation, or literal contract (*expensilatio*); but the last dated at soonest from the beginning of the 6th century, and stipulation apparently was a result of the Silian law itself, so that the *pecunia credita* of this enactment can have referred only to borrowed money. The same phrase, according to Livy, was employed in the Poetilian law; it was thereby enacted, he says, that for *pecunia credita* the goods, not the body of the debtor, ought to be taken in execution. A connexion, therefore, between the Poetilian law and the abolition of the *nexum* on the one hand, and the Silian law and the introduction of the *legis actio per condictionem* on the other, can hardly be ignored, and raises more than a probability that the latter statute was a consequence of the former, and must have been passed immediately or soon after the year 428. In the action for a money debt that was not technically *pecunia credita*, and in the action on the Calpurnian law, it is probable that the defendant could be required to negative the claim under oath (*jusjurandum in jure delatum*) on pain of being held as confessed; but there was no penalty of a third part on either side.

Little is known of the procedure¹ in this *legis actio*, for, in consequence of the loss of a leaf in the Verona MS., we are without part of Gaius's account of it. It got its distinctive name, he says, from the *condictio* or requisition made by the plaintiff on the defendant, whom he had brought into court in the usual way, to attend again on the expiry of thirty days to have a judge appointed. It was probably only on the reappearance of the parties, and after the defendant had had time for looking into the facts, that the latter could be required to make oath as to his defence of non-indebtedness. In the action for *pecunia credita* it would be then also, and after the oath, if demanded, had been given, that the *sponsio et restipulatio tertiæ partis* were exchanged; and it is probable that, if either party refused on the prætor's command so to oblige himself towards the other, judgment was at once pronounced in favour of the latter without any remit to a *judex*. How the issue was adjusted when the sponson and restipulation were duly given we are not informed; but, judging by analogy from the procedure in an action for breach of interdict under the formular system, and on the broader ground that there must have been machinery for a condemnation of the plaintiff on his restipulation in the event of his being found in the wrong, it may reasonably be concluded that there were in fact three concurrent issues sent to the same *judex*,—the first on the main question, the second on the defendant's sponson, and the third on the plaintiff's restipulation. When a sum of money other than *pecunia credita* or a thing or quantity of things other than money was sued for, those subsidiary issues were unnecessary, as there was neither sponson nor restipulation.

As Baron has demonstrated, it was not the usual practice to introduce any words explanatory of the ground of indebtedness when the action was either for money (other than *pecunia credita*) or for a thing or quantity of things. It might be loan, or bequest, or sale, or purchase, or delict, or unjustifiable enrichment, or any of a hundred *causæ*; it would have to be condescended on of course before the judge; but in the initial stage before the prætor and in the issue all that was necessary was the averment that the defendant was owing such a sum of money or such a thing. It was for the judge to determine whether or not the averment was established and, in certain cases, that non-delivery was due to the fault of the defendant; the plaintiff, however, was bound to make his averment good to the letter of his claim. In the event of the

plaintiff being successful in an action for *certa pecunia*, but delay was made by the defendant in satisfying the judgment, execution followed in ordinary form. How the matter was arranged in an action on the Calpurnian law for a *certa res* is not so obvious. What the plaintiff wanted was specific delivery or damages, and by some the opinion is entertained that he formulated his claim alternatively. Of this there is no evidence; and Gaius's statement that under the system of the *legis actiones* condemnation was always in the *ipsa res*, i.e., the specific thing sued for, leads to the assumption that a judgment for the plaintiff, on which specific implement failed, must have been followed by an *arbitrium litis aestimandæ* for assessment of the damages in money, and that execution proceeded thereon as if the judgment had been for a sum of money in the first instance. The general opinion, however, is that the judge to whom the issue was remitted assessed the damages himself and as a matter of course,—that the instruction to him was *quanti res erit, tantam pecuniam condemnato*.

The Legis Actio per Manus Injectionem.²—This "action *Per manus injectionem*" was ordinarily employed as a means of execution against the body of a judgment-debtor or one who had confessed liability in the first stage of a process. But, in certain cases in which it was thought proper that a creditor should have a more summary remedy than was afforded by a sacramental action or one *per judicis postulationem*, he was allowed to apprehend his debtor without any antecedent judgment; and, if the debtor disputed liability, the question could be tried only in proceedings at his instance, or sometimes at that of a third party on his behalf, for a stay of execution. It will simplify matters, however, to confine our attention to it in the meantime as a means of execution against the body of a judgment-debtor.

Gaius's description of it is very general; for details we are indebted principally to the *Noctes Atticæ* of Aulus Gellius, in an account which he gives (put into the mouth of Sext. Cæcilius Africanus, a well-known jurist of about the same time as Gaius, and a contemporary of his own) of the provisions of the XII. Tables in reference to it. Africanus is made to say that according to his belief (*opinor*) the words of the statute were these:—"For admitted money debts and in causes that have been regularly determined by judgment (*aeris confessi rebusque jure judicatis*) there shall be thirty days' grace. After that there may be *manus injectio*. The apprehending creditor shall then bring his debtor before the magistrate. If he still fail to satisfy the judgment, and no *vindex* come forward to relieve him, his creditor may carry him home and put him in chains. He may live at his own cost; if not, his creditor must give him daily a pound of spelt, or more if he please." Africanus continues *narrativè*: "There was still room for the parties to come to terms; but, if they did not, the debtor was kept in chains for sixty days. Towards the end of that time he was brought before the prætor in the comitium on three consecutive market-days, and the amount of the judgment-debt proclaimed. After the third *capite poenas dabat*,"—what these words mean will be considered in the sequel,—or else he was sent across the Tiber to be sold to a foreigner. And this capital penalty, sanctioned in the hope of deterring men from unfaithfulness to their engagements, was one to be dreaded because of its atrocity and of the new terrors with which the decemvirs thought proper to invest it. For, if it was to more creditors than one that the debtor had been adjudged, they might, if they pleased, cut up and divide his body. Here are the words

of the statute,—‘*Tertiis nundinis partis secanto. Si plus minusve secuerunt, se fraude esto.*’”

Such is Gellius's account of the provisions of the XII. Tables in reference to this *legis actio*. But it is to be borne in mind that he does not vouch for its accuracy; the Tables were already in his time matter of antiquity, and even the jurists knew nothing of them beyond what was still in observance. That he has reproduced them only partially seems almost beyond question; for in another chapter he himself quotes a couple of sentences that are to all appearance from the same context. We have to face, therefore, the extreme probability that the record is incomplete and the possibility besides that it is not literally accurate. There is room for error, consequently, in two directions; but the nature and effect of the procedure in its main features may be gathered from the texts as they stand with reasonable certainty.

It was competent only after thirty days from the date of judgment or confession. It was apprehension of the debtor by the creditor himself,—in its first stage, at least, an act of pure self-help. The debtor had at once to be brought before the magistrate, in order that his creditor might obtain authority to carry him away and provisionally confine him in the domestic lock-up. Such a course, however, was avoided either (1) by instant payment or other implement of the judgment, or (2) by the intervention of a *vindex* or champion. The position taken by the latter was not exactly that either of a surety or of an attorney for the *judicatus* demanding a rehearing of the case: he appeared rather as a controvertor in his own name of the right of the creditor to proceed further with his execution, on the ground that the judgment was invalid. This necessitated an action between the *vindex* and the creditor, in which the former was plaintiff, but to which the debtor was not a party. If it failed, then the *vindex* was liable for double the amount of the original debt, as a penalty on him for having improperly interfered with the course of justice; but on payment he had relief against the original debtor who had been liberated through his intervention. Failing a *vindex* and failing payment, the creditor took his debtor home and incarcerated him, dealing with him for sixty days in the manner above described. On their expiry, without any arrangement, there was a magisterial decree (*addictio*) awarding the debtor to his creditor.

What right did this *addictio* confer upon the creditor? The debtor, says Gellius, “*capite poenas dabat*,” which he interprets as meaning that his creditor might put him to death, the alternative being his sale as a slave beyond the Roman frontier. According to this view a man sentenced to twenty-five *asses* for a petty assault, which he could not pay, might have to suffer death instead. Manifest theft was considered a greater offence, or at least to merit a heavier punishment, than non-manifest,—slavery for the former, a pecuniary penalty for the latter; but, if it had been the case that every *judicatus* who failed within three months to satisfy his creditor might be put to death, then the non-manifest thief against whom a judgment had been obtained must often in the end have suffered a penalty more serious than that which overtook him whose theft had been manifest,—slavery for the graver offence, death for the lighter. *Capite poenas dabat*, therefore, cannot have meant death. But it is just as impossible that it can have meant slavery. And there is abundant evidence that the *addictus*, even after the completion of his two months of provisional detention, was still *de jure* free,—that he was not *capite minutus* even as regarded citizenship or family rights, and that any property he had still remained his own. The only other explanation is that “he paid the penalty with his person,” in contradistinction to “his means.” *Caput* is used in opposition to *bona*. Under the law of the Tables, when the *manus injectio* was at the instance of one creditor only, the extent of the latter's right was to detain his debtor in free bondage, making what use he could of his services, and exercising discipline over him as if he were a slave. But for the mistaken notion that a creditor was entitled after the expiry of the three months to put his debtor to death—of which there is not a single instance on record—it is unlikely that any one would have thought of imputing to the *partis secanto* such an inhuman meaning as that a plurality of creditors might cut the body of their *addictus* in pieces and each take a share.

The opinion is entertained by many jurists that the *partis secanto* of the Tables referred not to the body but to the belongings of the debtor,—that when there were concurrent creditors they shared his *familia* amongst them. There are two difficulties to face,—(1) that, once a debtor was in the hands of a creditor, even provisionally, *manus injectio* by a second creditor was impossible; and (2) that the debtor's estate did not fall within the power of the incarcerating creditor. The first is removed by a suggestion of Voigt's, that the plurality of creditors Gellius speaks of may have referred to the case of co-heirs taking proceedings against a debtor of their ancestor's. The second disappears on a slight rearrangement of the words of the Tables as Gellius records them.¹ The result to

which it brings us is this: where there was but one creditor concerned, and the two months of provisional detention expired without payment, or intervention of a *vindex*, or compromise of some sort, the debtor definitively became his creditor's free bondman in virtue of the magisterial *addictio*; but, where co-heirs were concerned, as bondage and service to all of them would have been inconvenient if not impossible when they were not to continue to possess the inheritance in common, the debtor was sent across the Tiber and sold as a slave, and the price got for him divided among them. If one or other got more than his fair share, no harm was done; for the disproportion could eventually be redressed in an action of partition (*actio familiae erciscundae*).

The disgraceful cruelties and indignities to which creditors subjected both their judgment and nexal debtors led to many a commotion in the first two centuries of the republic. The latter were probably much more numerous than the *judicati*, and, being in great part the victims of innocent misfortune, it was the sufferings they endured at the hands of relentless creditors that so often roused the sympathies and indignation of the populace. But the judgment-debtors had suffered along with them; and some of the provisions of the Poetilian law of 428 were meant to protect them against the needless and unjustifiable severity that had characterized their treatment. The *manus injectio* itself was not abolished, nor the possible intervention of a *vindex*; neither were the *domum ductio* that followed, and the provisional imprisonment with the light chains, authorized by the Tables while it lasted; nor was the formal *addictio* of the debtor to his creditor when the sixty days had expired without arrangement. But after addition, if it was for nothing more than civil debt, there were to be no more dungeons and stripes, fetters and foot-blocks; the creditor was to treat his debtor and his industry as a source of profit that would in time diminish and possibly extinguish his indebtedness, rather than as an object upon which he might perpetrate any cruelty by way of punishment. Although the edict of P. Rutilius of 647 U.C. provided a creditor with machinery for attacking the estate of his debtor, he had still the alternative of incarceration. This might be avoided under the Julian law of *cessio* by the debtor's making a complete surrender of his goods to his creditor; but, failing such surrender, incarceration continued to be resorted to even under the legislation of Justinian. Latterly, however, it was not by *manus injectio* that the incarceration was effected; for it went out of use with the definitive establishment of the formular system of procedure.

It was as directed against judgment and nexal debtors (see *infra*, p. 693) that *manus injectio* was of most importance and chiefly made its mark in history. But there were other cases in which it was resorted to under special statutory authority, where a remedy seemed advisable more sharp and summary than that by ordinary action. In some of these it was spoken of as *manus injectio pro judicato* (i.e., as if upon a judgment), in others as simple *manus injectio* (*manus injectio pura*). In the first the arrestee was not allowed to dispute his alleged indebtedness in person; he could do so only through a *vindex*; and if no one intervened for him in that character he was carried off and dealt with by his arresting creditor as if a judgment had been obtained against him. In the second he was not required to find a *vindex*, but might himself dispute the verity of the charge made against him, under penalty, however, of a duplication of his liability if he failed in his contention. By a *Lex Vallia*, probably in the latter half of the 6th century of the city, this *manus injectio pura* was substituted for that *pro judicato* in all cases in which the ground of arrest was neither judgment nor *depensum*, i.e., payment by a surety or other party on account of the true debtor, who failed to relieve the former within six months thereafter.

*The Legis Actio per Pignoris Capionem.*²—In the ritual

this: “*Tertiis nundinis addicitor. Capite poenas dato. Si plures sunt, trans Tiberim peregre venum danto, partis secanto. Si plus minusve secuerunt, se fraude esto.*”—“On the third market-day there shall be decree of addition. The *addictus* shall then pay the penalty with his person. If there be several creditors to whom he is awarded, let them sell him beyond Tiber and divide the price. If any of them have got more or less than his fair share, no harm shall result.”

² To the literature on p. 681, note 1, add Degenkolb, *Die Lex Hiero-*

¹ Reconstructions are always hazardous. But, on the footing above explained, the provision of the Tables may have been something like

Per
pignoris
capio-
nem.

of the *actio sacramenti* the *vis civilis et festuaria* was a reminiscence of the *vera solida vis* with which men settled their disputes about property in the earliest infancy of the commonwealth. *Manus injectio* was a survival from times when the wronged was held entitled to lay hands upon the wrongdoer, and himself subject him to punishment; custom and legislation intervened merely to regulate the conditions and mode of exercise of what essentially was still self-help. In *pignoris capio* self-help was likewise the dominant idea. It may be fairly enough described by the single word distress,—the taking by one man of property belonging to another in satisfaction of or in security for a debt due by the latter which he had failed to pay. The taking did not proceed upon any judgment, nor did it require the warrant of a magistrate; it might be resorted to even in the absence of the debtor; but it required to be accompanied by certain words of style, spoken probably in the presence of witnesses. It was only in a few exceptional cases that it was competent, in some by force of custom, in others by statute. What was the procedure, and what its effects, are far from certain. Ihering, founding on some expressions of Cicero's, conjectures that, whether the debt was disputed or not, the distrainer could neither sell nor definitely appropriate his *pignus* without magisterial authority,—that in every case he was bound to institute proceedings in justification of his caption, and to take in them the position of plaintiff. The idea is ingenious, and puts the *pignoris capio* in a new and interesting light. It makes it a summary means of raising a question of right for whose judicial arbitration no other process of law was open,—with the additional advantage that it secured instant satisfaction to the raiser of it in the event of the question being determined in his favour. If against him, the inevitable result, in substance at least, must have been a judgment that he had no right to retain his pledge, with probably a finding that he was further liable to its owner in the value of it, as a punishment for his precipitancy.¹

Pro-
cedure
outside
legis
actiones.

Judicial or Quasi-Judicial Procedure outside the Legis Actiones.—Whatever may have been the extent of the field covered by the actions of the law, they did not altogether exclude other judicial or quasi-judicial agencies. The supreme magistrate every now and then was called upon to intervene in matters brought under his cognizance by petition or complaint, in which his aid was sought not so much to protect a vested right of property or claim as to maintain public order, or to prevent the occurrence or continuance of a state of matters that might prove prejudicial to family or individual interests. The process was not an action, with its stages *in jure* and *in judicio*, but an inquiry conducted from first to last by the magistrate himself; and his finding, unless it was a dismissal of the complaint or petition, was embodied in an order (*decretum, interdictum*) which it was for him to enforce by such means as he thought fit,—*manu militari* or by fine or imprisonment. Some jurists are disposed to give a very wide range to this magisterial intervention. One of its most important manifestations was in connexion with disputes about the occupancy of the public domain lands. These did not belong in property to the occupants, so that an action founded on ownership was out of the question. But, as the occupancy was not only recognized but sanctioned by the state, it was right, indeed necessary in the interest of public order, that it should be protected against disturbance. In the measures resorted to for its protection Niebuhr recognized the origin of the famous possessory interdict *uti possidetis*; and, although opinions differ as to whether protection of the better right

or prevention of a breach of the peace was what primarily influenced the magistrate's intervention, there is a pretty general accord in accepting this view. Another illustration of this magisterial intervention is to be found in the interdiction of a spendthrift,—a decree depriving of his power of administration a man who was squandering his family estate and reducing his children to penury; a third presents itself in the removal of a tutor from office on the ground of negligence or maladministration, brought under the notice of the magistrate by any third party in what was called *postulatio suspecti tutoris*; and a fourth in the putting of a creditor in possession of the goods of an insolvent debtor, which must have been common enough even before the general bankruptcy regulations of the Rutilian edict. These are to be taken merely as examples of this magisterial intervention, which manifested itself in very various directions; and it is easy to see how largely such procedure might be utilized for remedying the grievances of persons who, from defect of complete legal title, want of statutory authority, or otherwise, were not in a position to avail themselves of the "actions of the law."

In one of the Valerio-Horatian laws consequent on the second secession of the plebeians there was mention of ten judges (*judices decemviri*), whose persons were declared as inviolable as those of the tribunes of the people and the plebeian aediles. These were a body of judges elected to officiate on remit from a tribune or aedile in questions arising between members of the plebeian body. We are without details as to the institution of this plebeian judicatory, the questions that fall under its cognizance, the forms of process employed, the law administered by it, and the effect of its judgments. It is not much referred to by the historians; and its decadence has been attributed to the fact that the *Lex Hortensia* of 468 made the *mundinae* lawful court days (*dies fasti*), and so made it possible for the country folks coming to the city to market to carry on their processes before the praetor.

As all in a manner exercising judicial or quasi-judicial functions must also be mentioned the pontiffs, the consuls, and afterwards the censors as *magistri morum*, the chiefs of the *gentes* within the gentile corporations, and heads of families within their households. While it may be the fact that with the enactment of the XII. Tables the jurisdiction of the pontiffs² was materially narrowed, it certainly did not disappear,—witness the famous case in which Cicero made before them the oration of which he was so proud, *Pro domo sua*. The action of the consuls and afterwards of the censors as guardians of public morals, and the social and political disqualifications and pecuniary penalties with which they visited persons who had been guilty of perjury or gross perfidy, did not a little to foster fidelity to engagements. Through the same agency the exercise of a variety of rights whose abuse could not be made matter of action—the husband's power over his wife, the father's over his children—was controlled and kept within bounds. It was not on light grounds, indeed, that the majesty of the *paterfamilias* within the household could be called in question; it was only when he forgot that in the exercise of serious discipline within his family he was bound to act judicially. For he also was a judge—*judex domesticus*, as he is often called, though in all cases of gravity he was required to invoke the advice of his kinsfolk in a family council. On him lay the duty of controlling his family; if he failed to do so he was himself in danger of censorial animadversion. That his *gens* also, if he were a patrician, had some supervision and power of calling him to account is extremely probable; every corporation had it more or less over its members; but neither historians nor jurists give us any definite information.

Between citizens and foreigners with whom Rome was in alliance Recupe- by a treaty conferring reciprocal right of action the proceedings ratio. took the form known as *recuperatio*.³ It was an international process, modelled to some extent upon, and deriving some of its technical terms from, the *fetial clarigatio*. The action was always raised in the *forum contractus*. The magistrate ordinarily presiding there heard what parties had to say in plaint and defence, and then put in simple shape the points of fact arising on them, authorizing the recuperators to whom the matter was remitted to find for plaintiff or defendant according to circumstances. The recuperators were sometimes three, sometimes five, sometimes still more numerous, but always in odd number; whether the nationality of both parties required to be represented we are not told. Expedition being in most cases a matter of importance, recuperators were required to give judgment within ten days. How execution proceeded upon it, if it were for the plaintiff, does not clearly appear;

nica, Berlin, 1861, p. 95 sq.; Ihering, *Geist d. röm. Rechts*, vol. i. § 11c; Voigt, *XII. Tafeln*, vol. i. p. 502 sq.

¹ This was according to the spirit of the early system, which endeavoured to check reckless or dishonest litigation by penalties,—e.g., forfeiture of the *summa sacramenti* and duplication of the value of unrestored property and profits in the sacramental procedure; duplication of the value of the cause when judgment was against the defendant in an action upon an engagement embodied in a *lex mancipii* or *lex nexi*; duplication against a *vindex* who interfered ineffectually in *manus injectio* against a judgment-debtor; duplication against an heir who refused without judicial compulsion to pay a legacy bequeathed *per damnationem*; the addition of one-third more by way of penalty against a debtor found liable in an *actio certae creditae pecuniae*, &c.

³ See Collman, *De Romanor. jud. recuperatorio*, Berlin, 1835; Carl Sell, *Die recuperatio der Römer*, Brunswick, 1837; Huschke (rev. Sell), in Richter's *Krit. Jahrbücher*, vol. i. (1837), pp. 868-911; Voigt, *Jus naturale*, &c., vol. ii. §§ 28-32; Karlowa, *Röm. Civilprocess*, pp. 218-230.

Voigt, founding on a few words in Festus, concludes it must have been by something like *pignoris capio*. This recuperatory procedure in time came to be resorted to in some cases even where both parties were citizens. There are numerous instances of it in Cicero; and it is remarkable that in most of the praetorian actions *ex delicto* the remit was not to a *judeex* but to recuperators. The explanation may be in the comparative summariness of the remedy.

III. DEVELOPMENT OF THE SUBSTANTIVE INSTITUTIONS OF THE LAW.

The citizen and his caput.

The Citizen and his "Caput."—The early law of Rome was essentially personal, not territorial. A man enjoyed the benefit of its institutions and of its protection, not because he happened to be within Roman territory, but because he was a citizen,—one of those by whom and for whom its law was established. The theory of the early *jus gentium* was that a man sojourning within the bounds of a foreign state was at the mercy of the latter and its citizens, that he himself might be dealt with as a slave, and all that belonged to him appropriated by the first comer; for he was outside the pale of the law. Without some sort of alliance with Rome a stranger had no right to claim protection against maltreatment of his person or attempt to deprive him of his property; and even then, unless he belonged to a state entitled by treaty to the international judicial remedy of *recuperatio*, it was by an appeal to the good offices of the supreme magistrate, or through the intervention of a citizen to whom he was allied by the (frequently hereditary) bond of *hospitium*, and not by means of any action of the *jus civile* set in motion by himself. A non-citizen—originally *hostis*, and afterwards usually called *peregrinus*¹—in time came to be regarded as entitled to all the rights the *jus gentium* recognized as belonging to a freeman, and to take part as freely as a Roman in any transaction of the *jus gentium*; but that was not until Rome, through contact with other nations and the growth of trade and commerce, had found it necessary to modify her jurisprudence by the adoption of many new institutions of a more liberal and less exclusive character than those of the *jus civile*.

A citizen's civil personality was technically his *caput*. The extent of it depended on his family status. It was only among citizens that the supremacy of the *paterfamilias* and the subjection of those *in manu, potestate, or mancipio* were recognized,—only among them therefore that the position of an individual in the family was of moment. While in public life a man's supremacy or subjection in the family was immaterial, in private life it was the *paterfamilias* alone who enjoyed full jural capacity. Those subject to him had a more limited personality; and, so far as capacity to take part in transactions of the *jus civile* was concerned, it was not inherent in them but derived from their *paterfamilias*: they were the agents of his will, representatives of his *persona* in every act whereby a right was acquired by them for the family to which they belonged.

Capitis deminutio.

Whenever a citizen either ceased altogether to be a member of a Roman family or passed from one family into another, there was technically *capitis minutio* or *deminutio*, except in the cases of *filiifamilias* and *filiaefamilias* becoming flamens or vestals; for, though they changed their family,

yet it was by passing from a human into a divine one. When a citizen forfeited his freedom, his *capitis deminutio* was said to be *maxima*; he lost all capacity, whether under the *jus civile* or the *jus gentium*. When, retaining freedom, he went into exile or joined a Latin colony, or otherwise became a peregrin, the diminution of his capacity was only *media* or *minor*; it was his rights and privileges under the *jus civile* that alone were affected. When both freedom and citizenship remained, and no more occurred than the severance of his connexion with a particular family (*familiae mutatio*), the diminution was said to be *minima*. Very simple illustrations present themselves in the case of a *paterfamilias* becoming *filiusfamilias* by adrogation, or a *materfamilias* passing into the hand of a husband by confarreation or coemption; in both cases he or she who had been *sui juris* thereby became *alieni juris*. This was descent in the family scale. It almost appears as if some of the later Roman jurists assumed, as do many moderns, that such descent or degradation was essential to the idea of *minutio capitis*; for Paul accounts for its presence in the case of emancipation—which converted a *filiusfamilias* into a *paterfamilias*, and thus manifestly improved his status—by the observation that in the process of release from his father's *potestas* a child had to pass, for however brief a period, through a condition of quasi-slavery (*mancipium*). But in reality degradation had nothing to do with it. It was immaterial whether the change was from a higher family position to a lower, or from a lower to a higher,² or to the same position in the new family that had been held in the old,—as when a *filiusfamilias* was transferred by his father into the *potestas* of an adopter, or when the *filiifamilias* of a person giving himself in adrogation passed with him into the *potestas* of the adrogator: in every case there was *capitis minutio*. It was not the change of family position that caused it, but the change of family itself,—the change from one family to another. The civil personality of Titius while a *filiusfamilias* in the *potestas* of Sempronius,—the expectancy of succession, the agnatic relationships, the derivative capacity for being a party to a mancipation or a *sponsio* that resulted from the relationship,—all came to an end through the severance of the family tie. He might acquire a new and independent capacity on becoming *sui juris* by emancipation, or a new derivative capacity on passing into the *potestas* of Mævius by adoption; but his old personality *quoad civile* was extinguished. This is what some of the jurists mean when they say that *capitis deminutio* was civil death.

The most important consequence of *minima capitis deminutio* was that it not only extinguished *patria potestas* where it existed, but severed the bond of agnation between the *capite minutus* and all those who had previously been related to him as agnates. There was no longer any right of succession between them on intestacy; their reciprocal prospective rights of tutory were defeated, and the *minutio* of either tutor or ward put an end to a subsisting guardianship, assuming always that it was a *tutela legitima* or agnatic *cura furiosi*. Very remarkable, yet quite logical, was the doctrine that the *minutio* extinguished the claims of creditors of the *minutus*; their debtor, the person with whom they had contracted, was civilly dead, and dead without an heir, and therefore there was no one against whom an action of the *jus civile* could be directed in order to enforce payment. But equity eventually provided a remedy, by giving the creditors a praetorian action in which the *minutio* was held as rescinded, and which the new *paterfamilias* was bound to defend on pain of having to give up all the estate

¹ Neither "alien" nor "foreigner" is an adequate rendering of *peregrinus*. For *peregrini* included not only citizens of other states or colonies, independent or dependent, but also *ἀπόδιδες*,—men who could not call themselves citizens (*cives*) at all, as, for example, the *dediticii* whom Rome had vanquished and whose civic organization she had destroyed, offenders sent into banishment, &c.; and until Caracalla's general grant of the franchise the greater proportion of her provincial subjects were also spoken of as peregrins. This, though linguistically objectionable, is a safer word than "non-citizen"; for the latter would include the Junian Latins of the early empire, who, though not citizens, yet were not reckoned as *peregrini*.

² Children who became *sui juris* by their parent's death did not change their family; the change was not in them, but in the disappearance of the family head; therefore they were not regarded as *capite minuti*.

he had acquired through the adrogation or *in manum conventio*.

Law of
family
relations.

The Law of the Family Relations.—So far as appears no serious inroad was made by the XII. Tables on the law affecting husband and wife, unless in the recognition of the legality of marriage entered into without any solemnity, and not involving that subjection of the wife to the husband (*manus*) which was a necessary consequence of the patrician confarreation and plebeian coemption. These were left untouched. But it seems to have become a practice with some of the plebeians to tie the marriage bond rather loosely in the first instance,—possibly (as became quite general at a later period) in consequence of objection by the women to renounce their independence and right to retain their own property and earnings, more probably because taking a woman to be merely the mother of their children (*matrimonium*) had been forced upon them before coemption had been introduced as a means of making her a lawful wife, and so they had become in a manner habituated to it. But there seems also to have been an idea that, as a man might acquire the ownership of a thing to which his legal title was defective by prolonged possession of it, so he might acquire *manus*, with all its consequences, over the woman with whom he had thus informally united himself by prolonged cohabitation with her as his wife. This had become customary law. The Tables accepted it; all that was needed was to define the conditions under which *manus* should be held to have been superinduced, and the wife converted from a doubtful *uxor* into a lawful *materfamilias*. Hence the provision that, if a woman, married neither by confarreation nor coemption, desired to retain her independence, she must periodically absent herself for three nights from her husband's house (*trinoctialis usurpatio*),—twelve months' uninterrupted cohabitation being required to give him that power over her which would have been created instantly had the marriage been accompanied by either of the recognized solemnities.

Amongst the fragments of the Tables so industriously collected there is none that refers to a wife's marriage portion (*dos*); but it is hardly conceivable that it was as yet unknown. Justinian says that in ancient times it was regarded as a donation to the husband with his wife, rather than as a separate estate that was to be used by him while the marriage lasted but to revert to her or her representatives on its dissolution. And it is easy to see that, where there was *manus*, the wife becoming a member of her husband's family and everything of hers becoming his, such must originally have been its character. But even then, when a man gave his daughter (*filiafamilias*)—who could have nothing of her own—in marriage, and promised her husband a portion with her, there must have been some process of law for compelling him to pay it; and Voigt's conjecture that an *actio dictae dotis* was employed for the purpose has much in its favour. As regards divorce, Cicero alludes vaguely to a provision in the Tables about a man depriving his wife of the house-keys and turning her out of doors, with some such words as "take what is thine and get thee gone." This cannot have applied to confarreate marriages, which could be dissolved only by the religious ceremony of diffarreation. And even as regards other marriages the statement of the historians is that divorces were few and far between until the 6th century of the city, and that, until the same date, any man who turned his wife away, however serious the ground, without the cognition of the family council was liable to penalties at the hands of the censors.

Of the two or three provisions of the Tables that affected details of the *patria potestas*, which itself was assumed to be so well established by customary law as to need no statutory sanction or definition, one was in the words "si paterfamilias ter filium venundit, a patre filius liber esto." This came to be construed by the jurists as meaning that so powerful was the bond of the *potestas* that it could not definitively be loosed until the father had three times gone through the process of fictitious sale by which emancipation was effected. But the conception of the law seems to indicate that its original purpose must have been rather to confer a benefit on a son *in potestate*, by declaring him *ipso jure* free from it on a certain event, than to place difficulties in the way of his emancipation. "If a house-father have thrice sold his son, the latter shall be free from his father." It reads as if the intention were to rescue the

son from what, by its frequent repetition, was suggestive of a total absence of parental affection rather than reluctant obedience to overwhelming necessity. May not its object have been to restrain the practice, which prevailed to a late period in the empire, of men giving their children to their creditors in security for their loans,—a process that, at the time of the Tables, could be effected only by an actual transfer of the child *per aes et libram* as a free bondman (*mancipii causa*), under condition of reconveyance when the loan was repaid?

The nature of the relation between master and slave, like that of *manus* and *patria potestas*, seems also to have been too notorious to require exposition in the Tables. We find recorded only two references to it, one dealing with the case of a slave who had a conditional testamentary gift of freedom (*statu liber*), the other with noxal surrender (*noxae deditio*). The provision about noxal surrender in all probability was not limited to a slave; it was to the effect that, if a member of a man's family (*familias*, i.e., a son or a daughter *in potestate* or a slave) committed a theft from or did mischief to property belonging to a third party, or a domestic animal belonging to one man did harm to another, the father of the delinquent child, or the owner of the slave or animal, should either surrender him or it to the person injured or make reparation in damages. In course of time the surrender came to be regarded as a means of avoiding the primary obligation of making reparation. But comparative jurisprudence recognizes in the enactment of the Tables a modified survival of the ancient right of an injured party to have the delinquent *corpus*,—man, beast, or thing,—given up to him to wreak his revenge upon it privately, the modification consisting in the alternative of reparation offered to the owner. This noxal surrender, failing reparation, had gone out of use in the case of daughters *in potestate* before the time of Gaius, and in the case of sons before that of Justinian; but the law remained unchanged so far as slaves and domestic animals were concerned even in that emperor's legislation.

Guardianship and the Introduction of the Order of Agnates. Gentile —So long as Rome was patrician the *gens* charged itself guardianship with the guardianship of a clansman's orphaned pupil children and his widow and unmarried daughters above pupilarity after his decease (*tutela*), as well as with that of male members of his family who were *sui juris*, but above the age of pupilarity, when they chanced to be lunatic, imbecile, prodigal, or helplessly infirm (*cura, curatio, curatela*). That was on the supposition, as regarded children, widow, and unmarried daughters above pupilarity, that no testamentary appointment of tutors by their deceased parent had displaced the *gens*, though whether testamentary nominations were then held competent it is impossible to say. The *gens* in council, in all probability, appointed one of its members to act as tutor or curator as the case might be, itself prescribed his duties, and itself called him to account for any failure in his administration.

But, as this gentile tutory could not be extended to the plebeians, among whom some law of guardianship was as much required as among their fellow-citizens of the higher order, the decemvirs found it expedient to devise a new one of universal application. The Tables contained no express authority for testamentary nomination of tutors to the widow of the testator, or to his pupil children and grown-up unmarried daughters; but such appointment, if unknown previously, was soon held to be justified by a liberal interpretation of the very inclusive provision, "uti legassit suae rei, ita jus esto." In the absence of testamentary appointment the nearest male agnates of lawful age were to be tutors. This tutory of agnates was an invention of the decemvirs, just as was the agnates' right of succession on intestacy. The plebeians had no *gentes*, at least until a much later period; so, to make the law equal for all, it was necessary to introduce a new order of heirs and tutors. "Tutores . . . ex lege XII. Tabularum introducuntur . . . agnati" is the very notable language of Ulpian. And his words are very similar in speaking of their right of succession; for, while he says of testamentary inheritances no more than that they were confirmed by the XII. Tables, he explains that the *legitimae hereditates* of agnates and patrons were derived from them.¹ The

¹ Ulp., *Frag.*, xxvii. 5, "legitimae hereditatis jus . . . ex lege Duodecim Tabularum descendit." This derivation of agnatic inher-

phrases *legitima cognatio*, *legitima hereditas*, *legitimi heredes*, *tutela legitima*, *tutores legitimi* themselves proclaim the origin of agnation, agnatic inheritance, and agnatic tutory; for, though the word *legitimus* might be applied to any institution based on statute, yet in the ordinary case it indicated one introduced by the XII. Tables, the law of laws.

A man's agnates were those of his kinsmen who were subject to the same *patria potestas* as himself, or would have been had the common ancestor been still alive. A man's sons and daughters *in potestate*, therefore, whether the relationship was by birth or adoption, and his wife *in manu* (being *filiae loco*) were each other's agnates. But a wife not *in manu* was not their agnate; nor were children who had been emancipated or otherwise *capite minuti* the agnates of either their brothers and sisters or their mother *in manu*. A man was an agnate of his brother's children, assuming always that there had been no *capitis deminutio* on either side; but he was not an agnate of his sister's children, for they were not *ejusdem familiae*: they were agnates of their father's family, not of their mother's. In like manner, and again assuming the absence of *minutio capitis*, the children of brothers were each other's agnates, but not the children of a brother and a sister or of two sisters. Brothers and sisters were agnates of the second degree;¹ a man and his brother's children were of the third, the children of two brothers (*consobrini*) of the fourth, and so on,—it being a condition, however, that the kinship should always result either from lawful marriage or from adoption in one or other of its forms.

When, therefore, a man died leaving pupil male descendants or unmarried female descendants who by his death became *sui juris*, they got their brothers of lawful age as their tutors; if he was survived by his wife, and she had been *in manu*, her sons, or it might be stepsons, acted for her in the same capacity; in either case they took office as the nearest qualified male agnates. If the widow had no sons or stepsons of full age, and the children consequently no brothers, the tutory devolved on the agnates next in order,—i.e., the brothers germane and consanguinean of the deceased husband and father; for they were agnates of the third degree. And so with agnates of the fourth and remoter degrees. Failing agnates who could demonstrate their propinquity, the tutory probably passed to the *gens* when the ward happened to belong to one. This is nowhere expressly stated; but Cicero gives what he represents to be an enactment of the Tables, making the fellow-gentiles of a lunatic his guardians on failure of agnates; and analogy seems to justify the extension of the same rule to the case of sane pupil and female wards.

The curatory of minors above pupilarity was of much later date than the Tables. The only curatories they sanctioned were those of lunatics and spendthrifts. A lunatic (*furiosus*) was committed to the care of his agnates, and, failing them, of his fellow-gentiles; and a few words in Festus seem to suggest that arrangements had to be made by them for his safe custody.

Mancipation and the Law of Property.—In the early law there was no technical word for ownership of things; it was an element of the house-father's *manus*. In time, although it is impossible to say when, the word *dominium* came into use; but, so far as can be discovered, it did not occur in the XII. Tables, and must have been of later introduction. In those days, when a man asserted ownership of a thing, he was content to say, "It is mine," or, "It is mine according to the law of the Quirites." The distinction was this, that, while the first was sufficient to entitle a man *de facto* holding a thing as his own to protection against a thief or any one attempting forcibly to take it from him, the second was specially noticed by Danz in his *Gesch. d. röm. Rechts*, 2d ed., Leipsic, 1871-73, vol. ii. p. 95, but is generally ignored.

¹ To determine the degree of propinquity between two persons it was necessary to count the generations upwards from the first to the common ancestor and downwards from him to the second. Consequently brothers were related in the second degree, uncle and nephew in the third, first cousins in the fourth, and so on: "tot gradus quot generationes."

dispossess him, the second was necessary when he appealed to a court of law to declare the legality of his title and his right to oust an individual withholding the possession neither theftuously nor by force. It is said by some jurists of eminence that under the law of the Tables what afterwards came to be called "*dominium ex jure Quiritium*" was competent only in the case of *res Mancipi*,—of a man's house and farm, and the slaves and animals with which he worked them. But the usucapion (or acquisition by prolonged possession) which they confirmed and regulated undoubtedly conferred quiritarian right; and, as it applied to all things ownable without exception, it seems impossible to maintain that *res nec Mancipi* could not then be held in quiritarian ownership as fully as *res Mancipi*.

The modes in which these two classes of things might be acquired in property were very various. But there was this important difference,—that, while a natural mode of acquisition sufficed in the case of *res nec Mancipi*, some civil one was necessary for the derivative acquisition, at all events, of *res Mancipi*. The most important were mancipation, surrender in court, usucapion, and bequest as singular modes, and inheritance, *in manum conventio*, adrogation, and purchase of a confiscated estate as universal modes. All these, with the exception of mancipation, applied equally to *res nec Mancipi*. But the commonest of all the modes of transferring things of the latter class was simple tradition. If the transfer was by the owner, with the intention of passing the property, then the simple delivery of possession was enough, unless it was in virtue of a sale; in such a case, and because a vendor had as yet no action for the price, the Tables provided that the ownership should remain with him, notwithstanding the change of possession, until the price was paid or security given for it.

The origin of the distinction between mancappable and non-mancappable things, and of the form of conveyance by mancipation applicable to the first, has been explained in connexion with the reforms of Servius Tullius (*supra*, p. 676).² As he introduced it, mancipation (then called *mancipium*) was not the imaginary sale that Gaius speaks of, but as real a sale as could well be conceived,—the weighing in scales, held by an official, of the raw metal that was to be the consideration for the transfer of a *res Mancipi*, and the handing of it by the transferee to the transferor, with the declaration that thereby and therewith the thing in question became his in quiritary right,—and all this in words of style, and in the presence of certain witnesses who represented the people, and thus fortified the conveyance with a public sanction. As already shown, there is some reason to believe that, when large quantities of metal had to be weighed, the practice crept in of having this done before the witnesses had assembled; and in the formal act only a single pound was weighed as representing the whole amount. This paved the way for the greater change that resulted from the introduction by the decemvirs of coined money. From that moment weighing became unnecessary. The price was counted out before the ceremony, and sometimes left to be done afterwards; and, though, in that spirit of conservatism that was so marked in the adhesion to time-honoured forms after their *raison d'être* was gone, the scale-bearer and the scales were still retained as indispensable elements of the mancipation, yet the scales were simply touched by the purchaser with a single coin, in order that he might be able to recite the old formula—"I say that this slave is mine in quiritary right, and that by purchase (for such and such a price) with these scales and this bit of copper." And that one coin, says Gaius, was then handed by the transferee to the transferor, as if it were in fact the price of the purchase (*quasi pretii loco*). Thus transformed, the mancipation was undoubtedly an imaginary sale; for the real price might have been paid weeks or months before, or might not be paid until weeks or months afterwards. The mancipation had become nothing more than a conveyance, and in this form it continued down to the end of the 3d century of the empire to be the appropriate mode of transfer of a *res Mancipi*, or at least of conferring on the transferee of such a thing a complete legal title (*dominium ex jure Quiritium*). After that, however, it seems gradually to have gone into disuse, being inapplicable to lands out of Italy that did

² Literature:—Leist, *Mancipation und Eigenthumstradition*, Jena, 1865; Ihering, *Geist d. röm. Rechts*, vol. ii. § 46; Bechmann, *Geschichte d. Kaufs im röm. Recht*, Erlangen, 1876, pp. 47-299; Voigt, *XII. Tafeln*, vol. i. § 22, vol. ii. §§ 84-88.

not enjoy what was called *jus Italicum*; and long before the time of Justinian it had entirely disappeared.

The effects of a mancipation, provided the price had been paid or security given for it, were that the property passed instantly to the purchaser, and that the transferrer was held to warrant the transferee against eviction from the moment the price was received. In the absence of either payment or sureties for it, the title still remained with the vendor, so that it was in his power, by means of a real action, to get back what had been mancipated, even though it had passed into the possession of the vendee. The vendor's liability to the vendee in the event of eviction is usually supposed to have arisen *ipso jure*, that is to say, without anything expressly said about it; the acceptance by the transferrer of the coin with which the scales had been struck was held to have imposed upon him an obligation to maintain the transferee in possession, under a penalty of double the amount of the price, recoverable by the latter by what is usually called an *actio auctoritatis*. But this *ipso jure* obligation did not arise when the mancipation was either really or fictitiously gratuitous,—really, in the case of donations, &c., fictitiously, when, on purpose to exclude the warranty, the recital of the transferee was that the price was a single sesterce.

The right of a vendee to sue an *actio auctoritatis* arose only when eviction resulted from a decree in a regular judicial process at the instance of a third party disputing his title, and was conditional on his having done all that was necessary on his part to bring his vendor (*auctor*) into the field to defend his own interests. And the duration of the *auctoritas* was limited by statute to two years in the case of lands and houses, to one year in the case of other things. As possession for those periods was sufficient to cure any defect in the vendee's title, it was but reasonable that with their expiry the vendor's liability on his warranty should be at an end.

By a provision of the Tables in the very inclusive terms, "*cum nexum faciet mancipiumque, uti lingua nuncupassit, ita jus esto*," the importance of mancipation was immensely increased; for any sort of qualification germane to the transaction might be superinduced upon it, and the range of its application thus greatly extended. Such qualifications were spoken of as *leges mancipii*,—self-imposed terms, conditions, or qualifications of the conveyance, which, as integral parts of the transaction *per aes et libram*, partook of its binding character and were law between the parties. The matter of oral declaration might be the acreage of lands, their freedom from burdens or right to easements, reservation of a usufruct, limitation of their mode of use, undertaking to reconvey on a certain event, or what not; the result was just so many obligations created *per aes et libram*, whose contravention or denial (Cicero tells us) was punished with a twofold penalty. Ordinarily the words spoken in the hearing of the witnesses fixed the beginning and the end of the liability; it was enough that they were literally complied with, however much the other party might be injured by something inconsistent with their spirit, or which he had not taken the precaution to require should be made matter of declaration. But there was an exception (although possibly not introduced until long after the Tables) in the case of that particular mancipation agreement which was known by the name of *fiducia*, i.e., where the mancipation was to a creditor in security or to a friend for safe custody, and the engagement was to return the thing mancipated in the one case when the debt secured by it was paid and in the other on demand. In such cases the transferee took the conveyance more in the transferrer's interest than his own; he became a trustee, entitled to be treated with consideration, and neither mulcted in a twofold penalty when his inability to reconvey was due to no fault of his, nor forced to reconvey until relieved of charges incurred by him in reference to the property. Accordingly it became the practice to import into the mancipation a reference to *fides*—"fidei fiducie meum esse aio," with explanation of the purpose, &c., of the *fiducia* in the relative *lex mancipii*; this had the effect of freeing alike the right of the vendor and the obligation of the vendee from the hard-and-fast lines of the *jus strictum*, and subordinating them to the principles of *bona fides*.

Of the civil modes of acquiring property on singular title applicable to both *res mancipi* and *res nec mancipi* surrender in court (*in jure cessio*) was just a *rei vindicatio* arrested in its initial stage. The parties, cedent and cessionary, appeared before the magistrate; the cessionary, taking the position of plaintiff, declared the thing his in quiritary right; the cedent, as defendant, was asked what he had to say in answer; and, on his admission or silence, the magistrate at once pronounced a decree (*addictio*) which completed the transfer, but which might be subject to a condition or other limitation, or even to a fiduciary reservation. It was probably more resorted to for the constitution of servitudes, both real and personal, and transfer of such rights as *patria potestas*, tutory-at-law of a woman, or an inheritance that had already vested, than for conveyance of property. For it was not only inconvenient, inasmuch as it required the parties to appear before the supreme magistrate in Rome, and could not be carried through by a slave on his owner's behalf (as mancipation might), but it had the serious disadvantage that it did not *ipso jure* imply any warranty of title by

the cedent or afford the cessionary any action against him in the event of eviction. The reason was that in form the right of the cessionary flowed from the magisterial decree,—"*Since you say the thing is yours, and the cedent does not say it is his, I declare it yours*,"—and not from any act or word of the cedent's, who was passive in the matter.

Adjudication was the decree of a judge in a divisory action, such as one for partition of an inheritance amongst co-heirs; it conferred upon each of them a separate and independent right in a part of what as a whole had previously been joint property.

Usucapion,¹ regulated by the XII. Tables, but not immediately recognized previously in a vague and uncertain manner, converted uninterrupted possession (*usus*) into quiritary property by efflux of time. The provision in the Tables was to this effect—"usus auctoritas fundi biennium esto, ceterarum rerum annuus esto." The relation in which the words *usus* and *auctoritas* stand to each other has been a subject of much discussion: the prevailing opinion amongst modern civilians is that the first alone refers to usucapion, and the second to the warranty of title incumbent on the vendor in a mancipation, and that both were limited to two years in the case of lands (and, by extensive interpretation, houses), and to one year in the case of anything else. In the later jurisprudence the possession required to be based on a sufficient title and the possessor to be in good faith. But the decemviral code, as is now generally admitted, contained no such requirements; any citizen occupying immovables or holding movables as his own, provided they were usucapible and he had not taken them theftuously, acquired a quiritary right in two years or one, as the case might be, simply on the strength of his possession. Originally, therefore, it was simply the conversion of *de facto* possession, no matter how acquired so long as not by theft, into legal ownership when prolonged for the statutory period,—too often the maintenance of might at the cost of right. But in time it came to be regarded rather as a remedy for some defect of title, arising either from irregularity of conveyance or incapacity of the party from whom a transfer had been taken; and with the progress of jurisprudence it developed into the carefully regulated positive prescription which has found a place in every modern system.

The conception of the abstract notion of a real right in *Jura in* (or over) the property of another person (*jus in re aliena*)^{re aliena} is not to be looked for at so early a period in the history of the law as that now under consideration. The rural servitudes of way and water were no doubt very early recognized, for they ranked as *res mancipi*, and the XII. Tables contained various regulations in reference to the former. Usufruct, too, was probably not unknown; but the urban prædial servitudes bear the impress of a somewhat later jurisprudence. Pignorate and hypothecary rights were unknown as rights protected by action at the time now being dealt with.² Between private parties the only thing legally recognized of the nature of a real security was the *fiducia* that is described above. Approaching more nearly to the modern idea of a mortgage was the security *praedibus praedisque* required by the state from those indebted to it in assurance of their obligations. Here there was the double guarantee of sureties (*praedes*) and mortgaged lands of theirs (*praedia subsig-*

Recht*, Berlin, 1855; Pernice, *Labes*, vol. ii. pp. 152 sq.; Voigt, *XII. Tafeln*, vol. ii. § 91; Esmein, "Sur l'histoire de l'usucapion," in the *Nouv. Rev. Hist.*, &c., vol. ix. (1885), p. 261, sq.

² Hypothecary rights were certainly unknown until near the end of the republic. But Festus (s.v. "Nancitor;" see Bruns, *Fontes*, p. 274) speaks of a provision in the Cassian league between Rome and the Latin states of the year 262 u.c.—"*Si quid pignoris nasciscitur, sibi habeto*"—which makes it difficult to believe that the Romans were altogether unacquainted with pledge or pawn of movables as a transaction of some value *de facto* if not *de jure*.

nata); but how they were dealt with when the debtor made default is by no means clear.

Forms of testament. *Changes in the Law of Succession.*—The two forms of testament of the regal period (*supra*, p. 674) still remained in use in the early republic; but in course of time they were displaced by the general adoption of that executed with the copper and the scales (*testamentum per aes et libram*). It seems to be the general opinion that it was to the first two that the words applied which stood in the forefront of the provisions of the XII. Tables about inheritance,—“*uti legassit suae rei, ita jus esto.*” Whether resort was to the comitia or to the army, the testator’s own will in the matter was henceforth to be supreme. There was to be no more reference to the pontiffs as to the expediency of the testament in view of the interests of the family *sacra* and of creditors of the testator’s; from legislators, sanctioning a departure from the ordinary rules of succession, the assembled Quirites became merely witnesses,—recipients of the oral declaration of the testator’s will in regard to his inheritance.

Testament per aes et libram. The testament with the copper and the scales is depicted by Gaius as a written instrument. But he presents it in what was apparently the third stage of its history. Its probable origin has been explained in describing the result of the Servian reforms upon the private law. It was then not a testament but only a makeshift for one. A plebeian was not qualified in the regal period to make a testament in the comitia; so, instead, he transferred his estate to a friend on whom he could rely with instructions how to distribute it on his death. The transferee was called *familiae emptor*, because the conveyance was in form a mancipation for a nominal price.

It is not at all unlikely that the same device may occasionally have been resorted to by a patrician who had neglected to make a regular testament, and was seized with mortal illness before he had an opportunity of appealing to the curies. But such a disposition was not a testament, and may not have been so called. A testament was the nomination of a person as the testator’s heir,—sometimes the substitution of an individual of the testator’s choice for the heir assigned to him by law, sometimes the acceptance of the latter but in the character of testamentary heir, so that the testator might be able to impose upon him what burdens he pleased as the tacit condition of heirship. It made the person instituted as fully the representative of the testator after his death as his heir-at-law would have been had he died intestate. The *mortis causa* mancipation that opened the way for the testament *per aes et libram* conferred upon the *familiae emptor* no such character. Gaius says that he stood in place of an heir (*heredis loco*), inasmuch as he had such of an heir’s rights and duties as the *familiae venditor* had it in his power to confer and impose; but the transaction was but a conveyance of estate, with a limitation of the right of the grantee. It has been argued that, as the law did not recognize conditional mancipation, the conveyance must have operated as a complete and immediate divestiture of the grantee. But this does not follow. For it was quite competent for a man, in transferring property by mancipation, to reserve to himself a life interest; and apparently it was equally competent for him to postpone delivery of possession, without infringing the rule that the mancipation itself could not be *ex certo tempore*. So far as one can see, therefore, there was nothing to prevent the grantee of the conveyance (or quasi-testator) bargaining that he was to retain the possession till his death; and, as the *familia* was an aggregate of estate (*universitas rerum*) which retained its identity notwithstanding any change in its component elements, he must in such case have been as free to operate on it while he survived as if he had never conveyed it by mancipation.

Cicero incidentally remarks—what indeed the nature of the business of itself very distinctly suggests—that the true testament with the copper and the scales had its statutory warrant, not in the *uti legassit suae rei* of the XII. Tables, but in the provision contained in the words,—“*cum nexum faciet mancipiumque, uti lingua nuncupassit, ita jus esto.*” Reflexion on the import and comprehensiveness of these words led the interpreters to the conclusion that there was nothing in them to prevent the direct institution of an heir in the course of the *verba nuncupata* engrafted on a mancipation. From the moment this view was adopted

and put in practice the *familiae mancipatio* ceased to be a transfer of the testator’s estate to the *familiae emptor*; the latter’s purchase was now for form’s sake only, though still an indispensable form, since it was it alone that, according to the letter of the statute, imparted efficacy to the *nuncupatio*. But it was the *nuncupatio*—the oral declaration addressed to the witnesses—that really contained the testamentary disposition, *i.e.*, the institution of an heir, with such other provisions as the testator thought fit to embody in it. This was the second stage in the history of the testament *per aes et libram*. The third was marked by the introduction of tablets in which the testamentary provisions were set out in writing, and which the testator displayed to the witnesses, folded and tied up in the usual manner, declaring that they contained the record of his last will.

Gaius narrates the words spoken by the *familiae emptor* and addressed to the testator as follows:—“Your estate and belongings (*familia pecuniarum tua*), be they mine by purchase with this bit of copper and these copper scales, subject to your instructions, but in my keeping, that so you may lawfully make your testament according to the statute (*quo tu jure testamentum facere possis secundum legem publicam*).” The meaning of the words “in my keeping (*endo custodiam meam*)” is not quite obvious; they may have been remnants of an older style, or may be due to a clerical error of the writer of the Verona MS. Certain it is that they no more imported a real custody than a real property in the *familiae emptor*; for the testator remained so entirely master of his estate that the very next day if he pleased he might mancipate it anew to a different purchaser, and nuncupate fresh testamentary writings. The nuncupation was in these terms: “As is written in these tablets so do I give, so do I legate, so do I declare my will; therefore, Quirites, grant me your testimony”; and, adds Gaius, “whatever the testator had set down in detail in his testamentary tablets he was regarded as declaring and confirming by this general statement.” To the appeal of the testator the witnesses responded by giving their testimony in words which unfortunately are not preserved; and then the testament was sealed by testator, officials, and witnesses, the seals being outside according to the early fashion.

Although this testament with the copper and the scales was justified in the first instance by the provision of the XII. Tables as to the effect of nuncupative words annexed to a mancipation, yet in course of time it came to be subordinated to that other one which dealt directly with testamentary dispositions,—*uti legassit suae rei, ita jus esto*. Upon the words *uti legassit* the widest possible meaning was put by the interpreters: not only was a testator held entitled on the strength of them to appoint tutors to wife and children, to enfranchise slaves, and make bequests to legatees, but he might even disinherit his proper heir (*suus heres*) in favour of a stranger, so long as he did so in express terms. Institution of a stranger without mention of the proper heir, however, was fatal, at least if the latter was a son; for without express disinheritance (*exheredatio*) his father could not deprive him of the interest he had in the family property as in a manner one of its joint owners. It can hardly be supposed that disinheritance was contemplated by the compilers of the Tables: it was foreign to the traditional conception of the family and the family estate. But it was a right whose concession could not be resisted when claimed as embraced in the *uti legassit*, although generally discountenanced, and as far as possible restrained by the strictness of the rules imposed on its exercise.

In the absence of a testament, or on its failure from Intestate any cause, the succession opened to the heirs *ab intestato*. So notoriously were the *sui heredes* entitled to the first place—and that not so much in the character of heirs as of persons now entering upon the active exercise of rights hitherto existing, though in a manner dormant—that the compilers of the XII. Tables thought it superfluous expressly to declare it. “If a man die intestate, leaving no *suus heres*, his nearest agnate shall have his estate. If the agnate also fail, his gentiles shall have it.” It has been pointed out, in dealing with the tutory of agnates, that the notion of agnation, as a bond distinct from that which connected the gentile members of a clan, was due to the decemvirs. They had to devise a law of intestate tutory and succession suitable alike to the patricians who had *gentes* and to the plebeians who had none. To put the latter in exactly the same position as the former was beyond their power; for the fact had to be faced that the plebeians had no gentile institutions, and to create them was impossible.

The difficulty was overcome by accepting the principle of agnation upon which the patrician *gens* was constructed, and establishing an agnatic circle of kinsmen within the sixth degree, to which the *gens* as a corporation should be postponed in the case of the patricians, and which should come in place of it in the case of the plebeians. It was not perfect equalization, but the nearest approach to it that the circumstances permitted. The difference was that, when the agnates of a plebeian intestate failed, his inheritance was vacant, whereas, on failure of those of a patrician, there was devolution to his *gens* in its collective capacity. And this devolution was rendered all the more frequent by two "interpretations" put upon the statute,—(1) that, if the nearest agnates in existence declined the succession, those next in degree were not allowed to take it; and (2) that no female agnate could take it except a sister of the deceased intestate. The division among two or more agnates was always *per capita*, not *per stirpes*.

The order of intestate succession thus established by the XII. Tables, which prevailed until amended by the prætors probably in the 8th century of the city, was first to the *sui heredes* of the deceased, next to his nearest agnate or agnates, and finally, if the deceased was a patrician, to his *gens*. His *sui heredes* included those of his descendants in his *potestas* when he died who by that event (or even after it, but before his intestacy became manifest) became *sui juris*, together with his wife *in manu* (who, as regarded his succession, was reckoned as a daughter); but they did not include children whom he had emancipated or daughters who had passed *in manum* of a husband. Emancipated children did not even come in as agnates on failure of *sui*; for emancipation severed the tie of agnation as well as that of *potestas*. For the same reason no kinsman who had been emancipated, and so cut off from the family tree, could claim as an agnate; for those only were agnates who were subject to the same *patria potestas*, or would have been had the common family head been still alive.

Position of heirs. The opening of a succession (technically *delatio hereditatis*) in favour of *sui heredes*, whether in virtue of a testamentary institution or by operation of law on intestacy, at once invested them with the character, rights, and responsibilities of heirs. No acceptance was necessary, nor, according to the rules of the *jus civile*, was any declinature competent. They had been all along in a manner joint owners with their parent of the family estate, which by his death had become, nominally at least, an inheritance; and, as he had not thought fit to terminate their interest in it by emancipating or disinheriting them, they were not now allowed to disown it. Hence they were spoken of as necessary heirs (*heredes sui et necessarii*). A slave, too, whom his owner had instituted in his testament was a necessary heir: he could not decline, and was invested with the character of heir the moment the testator died. Not so with stranger institutes or agnates taking on intestacy: they were free to take or reject the inheritance as they saw fit; consequently an act of acceptance (*aditio*) was necessary on their part to make them heirs. It was not unusual for a testator, in instituting an heir, to require that he should make a formal declaration of acceptance within a limited time, failing which his right should pass to a substitute, who in turn was required to enter within a certain time; and so on with any number of substitutes, the series ending with one of his slaves, who became heir without entry, and thus saved the testator from the disgrace of *post mortem* bankruptcy in the event of the inheritance proving insolvent. The *uti legassit* of the Tables, as already remarked, conferred upon a testator very great latitude of testamentary disposition, even to the extent of disinheritance of *sui heredes*. This was a course, however, that was rarely resorted to unless when a child had been guilty of gross ingratitude, or when the parent had reason to believe his estate was insolvent and desired to protect his children from the responsibilities of inheritance. Usually his *sui*, if he had any, would be his institutes, and the purpose of the testament either to apportion the estate amongst them as he thought expedient, or to give him an opportunity of appointing tutors, bequeathing legacies, or enfranchising slaves. On intestacy the *sui* took equally, but *per stirpes*; that is to say, grandchildren by a son who had predeceased or been emancipated, but who themselves had been retained in their grandfather's *potestas*, took amongst them the share to which their father would otherwise have been entitled, instead of taking equal shares with their surviving uncles. It was

by no means uncommon, when the whole inheritance descended to sons, for them to hold it in common for many years as partners (*consortes*); but any one of them was entitled at any moment to claim a partition, which was effected judicially, by an arbitral procedure introduced, termed a *judicium* (or *arbitrium*) *familiae erciscundæ*. Where two or more strangers were instituted testamentarily, whether to equal or unequal shares, if one of them failed either by predecease or declinature his share accrued *ipso jure* to the others; for it was a rule that very early became proverbial that a man could not die partly testate and partly intestate. There was the same accrual among agnates on intestacy; and both they and stranger testamentary institutes had the same action for division of the inheritance that was made use of by *sui heredes*.

According to Gaius it was as a stimulus to heirs to enter as soon as possible to an inheritance that had opened to them, and thus pro make early provision alike for satisfying the claims of creditors of herede. the deceased and attending to his family *sacra*, that the law came to recognize the somewhat remarkable institution of usucapion or prescriptive acquisition of the inheritance in the character of heir (*usucapio pro herede*). Such usucapion was impossible—there was no room for it—if the deceased had left *sui heredes*; for the inheritance vested in them the moment he died. But, if there were no *sui heredes*, then any person taking possession of the property that had belonged to the deceased, and holding it for twelve months without interruption, thereby acquired it as if he were heir: in fact, according to the views then held, he acquired the inheritance itself. Gaius characterizes it as a dishonest acquisition, inasmuch as the usucapient knew that what he had taken possession of was not his. But, as already explained, the usucapion of the XII. Tables did not require *bona fides* on the part of the usucapient; he might acquire ownership by prolonged possession of what he knew did not belong to him so long as he did not appropriate it theftuously, *i.e.*, knowing that it belonged to another. But an inheritance unappropriated by an heir who had nothing more than a right to claim it belonged in strictness to no one; and there was no theft, therefore, when a person took possession of it with a view to usucapion in the character of heir. There can be little doubt that on the completion of his possession he was regarded as heir just as fully as if he had taken under a testament or as heir-at-law on intestacy,—that is to say, that he was held responsible to creditors of the deceased and required to charge himself with the family *sacra*. Gaius does not say as much; but both the Cornelian and the Mucian edict imposed the latter burden upon him who had usucapied by possession the greater part of a deceased person's estate; and it is but reasonable to suppose that the burden of debts must in like manner have fallen on the usucapient or usucapiants in proportion to the shares they had taken of the deceased's property.

The Law of Obligations.—The jurists of the classical Law of period attribute obligation either to contract, or delict, or obligations. miscellaneous causes (*variae causarum figurae*); and those arising from contract fill a place in the later jurisprudence vastly greater than those arising from delict. In the XII. Tables it was very different. In them delicts were much more prominent than contracts,—wrongs entitling the sufferer to demand the imposition of penalties upon the wrongdoer that in most cases covered both reparation and punishment. The disproportion in the formulated provisions in reference to the two sources of obligation, however, is not surprising. For, first of all, the purpose of the decemviral code was to remove uncertainties and leave as little as possible to the arbitrariness of the magistrates. In nothing was there more scope for this than in the imposition of penalties; and, as different offences required to be differently treated, the provisions in reference to them were necessarily multiplied. In the next place, the intercourse that evokes contract was as yet very limited. Agriculture was the occupation of the great majority; trade and commerce were more backward than in the later years of the regal period; coined money was just beginning to be used as a circulating medium. Lastly, the safeguards of engagement then lay to a great extent in the sworn oath or the plighted faith, of which the law had hardly begun to take cognizance, but which found a protection quite as potent in the religious and moral sentiments that had so firm a hold on the people.

It may be asked—If a man purchased sheep or store cattle, a Contract plough, a toga, a jar of wine or oil, had he no action to compel in delivery, the vendor no action for payment of the price? Did the general hire of a horse or the loan of a bullock create no obligation? Was partnership unknown and deposit and pledge and suretyship in

any other form than that of *vadimonium*? One can have no hesitation in answering that, as transactions of daily life, they must all have been more or less familiar. It does not follow, however, that they were already regulated by law and protected by the ordinary tribunals. The historical jurists are pretty well agreed that not only the real contracts of loan (*mutuum* and *commodatum*), deposit, and pledge, but also the consensual ones of sale, location, partnership, and mandate, and the verbal one of suretyship, were as yet very barely recognized by law. Sale was the offspring of barter,—of instant exchange of one thing for another. With such instant exchange there was no room for obligation to deliver on either side, even when the ware (*merx*) given by one of the parties was so much rough copper weighed in the scales. The substitution of coined money for the raw metal can hardly have effected any radical change: the ordinary practice of those early times must still have been ready-money transaction,—an instant exchange of ware for price; and it can only have been when, for some reason or other, the arrangement was exceptionally for delivery or payment at a future date, say next market day, that obligation was held to have been created. Was that obligation enforceable by the civil tribunals? Some jurists hold that it was,—that at no time were the *jus gentium* contracts outside the protection of judicial remedies, although by a simpler procedure than that resorted to for enforcement of the contracts of the *jus civile*. But two provisions in the XII. Tables seem to prove very clearly that it was not so enforceable. The first is one recorded by Justinian,—that, where a thing was sold and delivered, the property, nevertheless, was not to pass until the price had been paid or sureties (*vades*) for it accepted by the vendor. Far from being a recognition of the obligatory nature of the transaction, this provision is really a recognition of the inability of the law to enforce payment of the price by the vendee; it is a declaration that, on the latter's failure to pay, the vendor, unprotected by any personal action, should be entitled to get back the thing sold as still his own, no matter in whose hands he found it. The second related to the case of a person who had bought a victim for sacrifice, but had failed to pay for it. A real action for its revindication by the seller after it had been consumed on the altar was out of the question; so he was authorized by the Tables, by the process of *pignoris capio* (*supra*, p. 686), at his own hand to appropriate in satisfaction a sufficient equivalent out of the belongings of the purchaser, against whom he had no personal action.

Requisites of binding contract.

It was a principle of the law of Rome through the whole of its history, though in course of time subject to an increasing number of exceptions, that mere agreement between two persons did not give him in whose favour it was conceived a right to demand its enforcement. To entitle a man to claim the intervention of the civil tribunals to compel implement of an engagement undertaken by another, it was necessary (subject to those exceptions) either that it should be clothed in some form prescribed or recognized by the law, or that it should be accompanied or followed by some relative act which rendered it something more than a mere interchange of consent. Under the jurisprudence of the XII. Tables the formalities required to elevate an agreement to the rank of contract and make it civilly obligatory sometimes combined ceremonial act and words of style, sometimes did not go beyond words of style, but in all cases took place before witnesses. *Dotis dictio*, the undertaking of a parent to provide a dowry with his daughter whom he was giving in marriage, and *vadimonium*, the guarantee of a surety for the due fulfilment of the undertaking either of a party to a contract or a party to a litigation, probably required nothing more than words of style before persons who could if necessary bear witness to them; whereas an engagement incident to a mancipation, or an undertaking to repay borrowed money, required in addition a ceremony with the copper and the scales. This undertaking to repay arose from the contract of *nexum*, which was older than the Tables; both it and the verbal contract by *sponsio* or stipulation, which was younger, merit further consideration.

*The Nexal Contract.*¹—The tumults and seditions so

frequent in Rome during the first two centuries of the republic are more frequently attributed by the historians to the abuses of the law of debt than to any other cause, social or political. The circumstances of the poorer plebeians were such as to make it almost impossible to avoid borrowing. Their scanty means were dependent on the regular cultivation of their little acres, and on each operation of the agricultural year being performed in proper rotation and at the proper season. But this was every now and again interfered with by wars which detained them from home at seed-time or harvest, practically rendering their farms unproductive and leaving them and their families in straits for the commonest necessities of life. A poor peasant, in such a case, had no alternative but to apply to a capitalist for a loan. But it was not to be had without security, and rarely without interest. It was not that the lender doubted the borrower's honesty and willingness to repay his debt; it was rather that there was every chance that next year a fresh war might again interfere with the latter's agricultural operations, leave him again without a crop, and thus render repayment impossible. And so, while interest accumulated and was periodically added to capital, new loans had year after year to be contracted as long as any acres remained that could serve as a security; failing all things, the debtor had to impledge or hypothecate *himself*;² for, phrase it how we may, this was substantially the result of the contract of *nexum*.

The practice of lending *per libram* was doubtless of great antiquity,—indeed the intervention of the scales was a necessity when money or what passed for it had to be weighed instead of counted; and not improbably old custom conceded to a lender who had thus made an advance in the presence of witnesses some very summary and stringent remedy against a borrower who failed in repayment. How Servius subjected it to much the same formalities as he appointed for mancipation—the state scales, the official *libripens*, the five witnesses representing the nation—has been shown already. With the introduction of a coinage the transaction, instead of being *per libram* simply, became one *per aes et libram*; the scales were touched with a single piece, representing the money which had already been or was about to be paid, a formula recited whereby the obligation of repayment was imposed on the borrower, and an appeal made to the witnesses for their testimony. Unfortunately this formula is nowhere preserved. Huschke and Giraud, assuming that the lender was the only speaker, formulate it thus—"quod ego tibi mille libras hoc aere aeneaque libra nexas dedi, eas tu mihi post annum jure nexi dare damnas esto"—"whereas with this coin and these copper scales I have given thee a thousand asses, be thou therefore bound *jure nexi* to repay them to me a year hence." The phrase *damnas esto*, like the rest of the formula, is unsupported by any conclusive authority; but, as it was that most frequently employed in the republic for imposing by a public act liability to pay a fixed and definite sum, it may not be wide of the mark.

What was the effect of this procedure? The question is one not easily answered. Brinz has expressed the opinion that the creditor was entitled in virtue of the *nexum* to take his debtor into custody at any time when he considered such a course necessary for his own

¹ *Literature*.—Savigny, "Ueber d. altröm. Schuldrecht," in his *Verm. Schriften*, vol. ii. p. 396 sq.; Scheurl, *Vom Nexum*, Erlangen, 1839; C. Tafeln*, vol. i. §§ 63-65. There is a *résumé* of the principal theories (down to 1870) in Danz, *Gesch. d. röm. Rechts*, vol. ii., 2d ed., Leipsic, 1873, § 146.

² "He told them how he had been obliged to borrow money, because, when he had been away fighting against the Sabines, his farm had remained uncropped, his house had been burned, his cattle driven off, everything plundered, and at the same time, unhappily for him, a tribute imposed; how first his ancestral lands had gone, then his other property, and at last, like a wasting disease, it had come to his body; how his creditor, instead of putting him to work (*in servitium*), had thrown him into a dungeon and a torture-chamber" (*Liv.*, ii. 23).

protection, even before the conventional term of repayment,—that the debtor was in bonds, virtually a pledge, from the very first, and the tightness or looseness of them a matter in the discretion of his creditor.¹ Voigt holds that the *nexum* did not give the creditor any peculiar hold over his debtor, and that on the latter's failure to repay an ordinary action was necessary, to be followed by the usual proceedings in execution if judgment was in favour of the former. These views may be said to be the two extremes; and between them lie a good many others, more or less divergent. The difficulty of arriving at a conclusion is caused to some extent by the ambiguity of the words *nexus* and *nexum*. The transaction itself was called *nexum*; the money advanced was *nexum aes* (hence *nexi*, i.e., *aeris datio*); the bond was *nexus* (of the fourth declension); and the debtor on whom the bond was laid was also *nexus* (of the second). All this is simple enough. But we find the same word *nexus* employed by the historians as almost synonymous with *vinculus*, —to denote the condition of a debtor put in fetters by his creditor. That might be the condition either of a nexal borrower or of an ordinary judgment-debtor. The former in such a case was doubly *nexus*; he was at once in the bonds of legal obligation and in those of physical constraint. In many passages in which Livy and others speak of the *nexi* it is extremely difficult, sometimes impossible, to be sure in which sense they use the word. It is therefore not surprising that there should be considerable diversity of opinion on the subject, and such frequent identification of the legal status of a nexal debtor (*nexus*) with that of a judgment-debtor (*judicatus*).

Almost all writers—Voigt² is a distinguished exception—concur in opinion that the nexal contract entitled the creditor, after expiry of thirty days from the conventional date of repayment of the loan, to proceed against his debtor by *manus injectio* without any antecedent action or judgment, and failing settlement to detain him, and put him to servile labour and subject him to servile treatment, until the loan was repaid. The parallel of such a course is to be met with amongst all ancient nations,—Jews, Greeks, Scandinavians, Germans, &c.³ And it was not altogether unreasonable. If a borrower had already exhausted all available means of raising money, had sold or mortgaged everything he possessed of any value, what other course was open to him in his necessity except to impledge himself? That the creditor should have been entitled to realize the right he had thus acquired without the judgment on it of a court of law is equally intelligible. The nexal contract was a public act, carried out in the presence of the representatives of the people, who were witnesses alike of the acknowledgment of indebtedness and of the tacit engagement of the debtor. The only valid objection that could be stated against the creditor's apprehension of his debtor in execution was that the indebtedness no longer existed,—that the loan had been repaid. But a nexal debt could be legally discharged only by *nexi liberatio*, which also was a solemn procedure *per aes et libram* in the presence of five citizen witnesses. What need for a judicial inquiry in the presence of facts so notorious? A creditor would rarely be daring enough to proceed to *manus injectio* if his loan had been repaid; if he did, the testimony of the witnesses to the discharge would at once procure the release of his alleged debtor. It was probably to give opportunity for such proof, if there was room for it, that the XII. Tables required that a creditor who had apprehended a nexal debtor should bring him into court before carrying him off into detention.

But there was no room for the intervention of a *vindex* or champion, for there was no judgment whose regularity he could impugn. Nor was there any room for a magisterial *addictio* of the debtor to his creditor; for the latter's right of detention was founded on contract, and needed no decree to strengthen it. The creditor was entitled at once, after apprehension of his debtor and production of him in court in terms of the statute, to carry him home with him, take such steps as were necessary to ensure his safe custody, and employ his services in profitable industry. But that he could kill him or sell him, as some suppose, is a proposition that is destitute of any authority to support it. Equally untenable is the notion

that the *nexus* became a slave, or that, while retaining his freedom, his wife, children, and belongings fell with him into the hands of his creditor. He certainly was not in a worse position than an *addictus*, of whom Quintilian states distinctly that he still retained his position in the census and in his tribe. Many a time, when the exigencies of the state required it, were the *nexi* temporarily released in order to obey a call to arms,—to fulfil the duty incumbent on them as citizens. In fact a nexal debtor suffered no *capitis deminutio* at all because of his detention. If he was a house-father he still retained his *manus* over his wife and *potestas* over his children. But they did not share his quasi-servitude. Their earnings legally belonged to him, but were no doubt retained by them with his consent for their own support. They certainly did not fall to his creditor. It was the body of his debtor that he was entitled to, and too often he wreaked his vengeance on it by way of punishment; there was as yet no machinery for attaching the debtor's goods in substantial reparation for the loss caused by his breach of contract.

The abuses to which the system gave rise alike in the case of Pœtilian nexal and of judgment debtors have already been alluded to. In the law.

year 428 a more than ordinarily flagrant outrage committed by a creditor upon one of his young *nexi*, who, Livy says, had given himself up as responsible for a loan contracted by his deceased father, roused the populace to such a pitch of indignation as to necessitate instant remedial legislation. The result was the Pœtilian law (*Lex Pœtilia Papiria*). So far as can be gathered from the meagre accounts of it we possess, it contained at least these three provisions—(1) that fetters and neck, arm, or foot blocks should in future be applied only to persons undergoing imprisonment for crime or delict; (2) that no one should ever again be the *nexus* of his creditor in respect of borrowed money; and (3) that all existing *nexi qui bonam copiam jurarent* should be released. The first was intended to prevent unnecessary restraint upon judgment-debtors formally given over to their creditors. The second did not necessarily abolish the contract of loan *per aes et libram*, but only what had hitherto been an *ipso jure* consequence of it,—the creditor's right to incarcerate his debtor without either the judgment of a court or the warrant of a magistrate. For the future, execution was to be done against a borrower only as a judgment-debtor formally made over to his creditor by magisterial decree, and under the restrictions and limitations imposed by the Pœtilian law itself. This very soon led to the disuse of nexal obligation; once it was deprived of its distinctive processual advantages it rapidly gave place to the simpler engagement by stipulation enforceable *per conditionem*. As for the release of the then existing *nexi*, Cicero, Livy, and Dionysius say nothing of any condition annexed to the boon the statute conferred upon them; it is only Varro who limits it to those *qui bonam copiam jurarunt*,—those apparently who were able to declare on oath that they had done their best and could do no more to meet their creditors' claims. Such a limitation can hardly be called unreasonable, even were we to assume—as probably we ought to do,—that the release spoken of was only from the bonds of physical restraint, not from those of legal obligation.

*Introduction of the Stipulation.*⁴—Few events in the Stipulation history of the private law were followed by more far-reaching consequences than the introduction of the stipulation.

It exercised an enormous influence on the law of contract; for by means of it there was created a unilateral obligation that in time became adaptable to almost every conceivable undertaking by one man in favour of another. By the use of certain words of style in the form of question and answer any lawful agreement could thereby be made not only morally but legally binding, so that much which previously had no other guarantee than a man's sense of honour now passed directly under the protection of the tribunals. Stipulations became the complement of engagements which without them rested simply on good faith, as when a vendor gave his stipulatory promise to his vendee to guarantee peaceable possession of the thing sold or its freedom from faults, and the vendee in turn gave his promise for payment of the price. The question and answer in the form prescribed by law made the engagement fast and sure. Hence the generic name of the

¹ Brinz, in Grünhut's *Zeitschr.*, vol. i. p. 22. He likens the position of the *nexus* to that of a thing—land, say—mortgaged to a creditor in security of a claim. Such security the Roman jurists constantly speak of as *res obligata*, and sometimes as *res nexa*. As Brinz observes, the thing was *obligata* from the first, and continued so as long as the debt it secured was unpaid, even though the creditor found it unnecessary to reduce it into possession or interfere with it in any way.

² He holds that there was nothing peculiar in the obligation created *nexo*, i.e., that it did not impose any immediate liability on the borrower which the lender could enforce without judicial intervention, but that the latter required to proceed against the former in ordinary course, by what he calls an *actio pecuniae nuncupatae*.

³ See authorities in Brinz's paper in Grünhut's *Zeitschr.*, vol. i. p. 25. The Greek phrase was ἐπὶ ἀσφαρί δαπέφειν. There is a curious style in Marcellus (*Form.*, ii. 27), in which a borrower engages that, until he shall have repaid his loan, his creditor shall have right to his services so many days a week, and shall have power to inflict corporal punishment if there be dilatoriness in rendering them.

Röm.*, vol. ii. § 33, vol. iv., Beilage xix.; Girtanner, *Die Stipulation*, Kiel, 1859; Bekker, *Aktionen*, vol. i. pp. 382-401; Karsten, *Die Stipulation*, Rostock, 1878.

contract; for Paul's derivation of it from *stipulum*, "firm," is much to be preferred to the earlier and more fanciful ones from *stips* or *stipula*. It was round the stipulation that the jurists grouped most of their disquisitions upon the general doctrines of the law of contract,—capacity of parties, requisites of consent, consequences of fraud, error, and intimidation, effects of conditions and specifications of time, and so forth. It may well be said, therefore, that its introduction marked an epoch in the history of the law.

There is, however, no certainty either as to the time or as to the manner of its introduction. So far as appears it was unknown at the time of the compilation of the XII. Tables, at least in private life; one of the first unmistakable allusions to it is in the Aquilian law of 476 U.C. The mention of it in that enactment, however, is with regard to a phase of it which cannot have been reached for many years after it had come into use; and the probability is that it originated before the middle of the 5th century, its first statutory recognition being in the Silian law introducing the *legis actio per condictionem* (*supra*, p. 683). In its earliest days it bore the name not of *stipulatio* but of *sponsio*, for the reason that the interrogatory of the party becoming creditor was invariably formulated with the word *spondes*—e.g., *centum dare spondes?*—while the answer was simply *spondeo*.

Its
origin.

There has been much speculation as to the origin of the contract. Modern criticism has three theories,—(1) that it was the verbal remnant of the *nexum*, after the business with the copper and the scales had gone into disuse; (2) that it was evolved out of the oath at the great altar of Hercules and the appeal to Fides (*supra*, p. 675); (3) that it was imported from Latium, which it had reached from some of the Greek settlements farther south. The last view is the most probable. Verrius Flaccus, as quoted by Festus, connects it with the Greek *σπένδω* and *σπονδή*; and Gaius incidentally observes that it was said to be of Greek origin. A libation (*σπονδή*) is frequently referred to by Homer and Herodotus as an accompaniment of treaties and other solemn covenants,—a common offering by the parties to the gods which imparted sanctity to the transaction. Leist¹ is of opinion that the practice passed into Sicily and Lower Italy, but that gradually the libation and other religious features were dropped, although the word *σπονδή* was retained in the sense of an engagement that bound parties just as if the old ritual had been observed, and that it travelled northward into Latium and thence to Rome under the name of *sponsio*, being used in the first instance in public life for the conclusion of treaties, and afterwards in private life for the conclusion of contracts. The meaning of *spondes* as a question by a creditor to his debtor (although latterly, we may well believe, unknown to them) thus came to be—"Do you engage as solemnly as if the old ceremonial were gone through between us?" There are many examples of such simplification of terms, none more familiar than when a man says—"I give you my oath upon it," without either himself or the individual addressed thinking it necessary to go through the form.

Its
nature.

It is not a little remarkable that, although the idea was derived from abroad, the use of the words *spondes* and *spondeo* in contracting were, down at least to the time of Gaius, confined in Rome to Roman citizens. The *sponsio* as a form of contract was essentially *juris civilis*. So at first were the later and less solemn forms of stipulation,—*promittisne?* *promitto*, *dabisne?* *dabo*, and the like. Gaius speaks of these as *juris gentium*, i.e., binding even between Romans and peregrins. Such they became eventually, but not until towards the end of the republic. Yet, although *juris civilis*, both the *sponsio* and the later forms were from the first free from many of the impediments of the earlier *actus legitimi*. No witnesses were required to assist at them; and they were always susceptible of qualification by conditions and terms. It was very long, however, before parties had much latitude in their choice of language; *spondeo* was so peculiarly solemn that no equivalent could be admitted; and even the later styles may be said to have remained stereotyped until well on in the empire. And it was the use of the words of style that made the contract. It was formal, not material; that is to say, action lay upon the promise the words embodied, apart from any consideration whether or not value had been given for it. In time this serious disadvantage was abated; first

by introducing in certain cases words that excluded action in presence of fraud, antecedent or subsequent, on the part of the creditor, and afterwards by praetorian exceptions, such as a plea of "no value," or by having the contract set aside on the motion of the nominal debtor before proceedings had been taken upon it by the creditor. Originally the stipulation was employed only in regard to engagements whose terms were in every respect definite and certain, and was enforced by the *legis actio per condictionem*. But in time it came to be employed in engagements that were from the first indefinite. This seems to have been due to the intervention of the praetors, and to have originated after the system of the *legis actiones* had begun to give place to that *per formulas*. The remedy in such a case was not spoken of as a condition but as an *actio ex stipulatu*.

CHAPTER III.—THE JUS GENTIUM AND JUS HONORARIUM.

(Latter half of the Republic.)

I. INFLUENCES THAT OPERATED ON THE LAW.

Growth of Commerce and Influx of Foreigners.—While Influx it may be admitted that commerce was beginning to take of foreigners root in Rome in the 5th century, yet it was not until the 6th that it really became of importance. The campaigns in which Rome was engaged until the end of the First Punic War absorbed all its energies. But after that time the influx of strangers, and their settlement in the city for purposes of trade, became very rapid,—first Latins and other allies, and afterwards Greeks, Carthaginians, and Asiatics. For them and the regulation of their affairs the *jus civile*—the law peculiar to Rome and its citizens—was applicable only if they were members of allied states to which *commercium* and *recuperatio* were guaranteed by treaty. But multitudes were not in this favoured position; and even those who were soon found the range of Roman modes of acquiring property and contracting obligations too narrow for their requirements. Hence a *jus gentium* was gradually developed² which very early in its history drove treaty covenants for *recuperatio* out of use; its application may for a time have been limited to transactions between non-citizens or between citizens and non-citizens, but it was eventually accepted in the dealings of citizens *inter se* and became part and parcel of the *jus Romanorum*. Gaius and Justinian speak of it as "the common law of mankind," "the law in use among all nations"; but the language must not be taken too literally. The Roman *jus gentium* was not built up by the adoption of one doctrine or institution after another that was found to be generally current elsewhere. In the earliest stages of its recognition it was "an independent international private law, which, as such, regulated intercourse between peregrins or between peregrins and citizens on the basis of their common *libertas*";³ during the republic it was purely empirical and free from the influence of scientific theory, but its extensions in the early empire were a creation of the jurists,—a combination of comparative jurisprudence and rational speculation. To say that it was *de facto* in observance everywhere is inaccurate; on the contrary, it was Roman law, built up by Roman jurists, though called into existence through the necessities of intercourse with and among non-Romans.

It may be a little difficult for a modern jurist to say

² On the Roman *jus gentium*, see Voigt, *Das jus naturale, aequum et bonum, und jus gentium d. Römer*, 4 vols., Leipzig, 1856-75; Nettleship, in the *Journal of Philology*, vol. xiii. (1885), p. 169 sq.

³ Voigt, *Jus nat.*, vol. ii. 661. He distinguishes the *jus civile*, *jus gentium*, and *jus naturale* as the systems which applied respectively to the citizen, the freeman, and the man.

¹ *Græco-Itälische Rechtsgeschichte*, Jena, 1884, pp. 465-470. Upon the *sponsionis vinculum* internationally, see Livy, ix. 9.

with perfect precision what were the doctrines and institutions of the *jus gentium* as distinguished from the *jus civile*. But the distinction must have been very familiar to the Romans; otherwise we should not have had the statement of Marcian in reference to the ἀπόλλιδες,—that they enjoyed all the rights competent to a man under the former, but none of those competent to him under the latter.

The peregrin prætor. *Institution of the Peregrin Prætorship.*—The prætorship¹ was an outcome of the Licinian laws of the year 387 u.c. Down to the end of the 5th century the prætor then appointed superintended single-handed the administration of justice, alike between citizens and foreigners. But with the altered condition of things in the beginning of the 6th century, and the influx of strangers which has already been alluded to, the work seems to have been found too onerous for a single magistrate, and a second prætor was appointed. The date is not absolutely certain, although generally assumed to have been about the year 512 u.c.; but Pomponius says distinctly that the creation of the new office was rendered necessary by the increase of the peregrin population of Rome, and that the new magistrate got the name of *prætor peregrinus* because his principal duty was to dispense justice to this foreign element. After the submission of Sicily and Sardinia the number of the prætors was increased to four and after the conquest of Spain to six; Sulla raised the number to eight, and Caesar eventually to sixteen. But all the later creations were for special purposes; the ordinary administration of justice within the city was left with the representatives for the time of the two earliest, who came to be distinguished as *prætor urbanus* (*qui jus inter cives dicit*) and *prætor peregrinus*. It would be going too far to speak of the latter as the principal author of the *jus gentium*; for a large proportion of the actions for enforcing *jus gentium* rights were civil, not honorary,—a fact which proves that the rights they were meant to protect and enforce had their origin in the *jus civile*, although moulded to meet new requirements by tacit consuetude and the agency of the jurists. But even in this view the peregrin prætor must have had a powerful influence in giving shape and consistency to the rising jurisprudence, by means of the *formulae* he adjusted for giving it practical effect.

Reforms of Aebutian law. *Simplification of Procedure and Introduction of New Remedies under the Aebutian Law.*—The *Lex Aebutia* is only twice mentioned by ancient writers, and we know neither its precise date nor its specific provisions. And yet, to judge by its effects, it must have been one of the most important pieces of comital legislation in the latter half of the republic; for Gellius speaks of it as having given the deathblow to many of the institutions of the XII. Tables, and Gaius couples it with two Julian laws as the statutory instruments whereby the formular system of procedure was substituted for that *per legis actiones*. The probability is that it was enacted immediately or soon after the institution of the peregrin prætorship. Its purpose, whatever may have been its terms, seems to have been to empower the prætors to adapt existing remedies to altered circumstances, and to fashion new actions on the *jus civile* for the use of the peregrins to whom the procedure of the *legis actiones* was incompetent; while it may possibly at the same time have expressly authorized the insertion in the styles to be devised by them of clauses that would give protection when required against claims that in law were well founded but in fact inequitable. But, whatever may have been the actual provisions of the statute, the result was the introduction of a procedure which gradually supplanted that by the "actions of the law," which was much more pliant than the latter, and whose characteristic was this,—that, instead of the issue being declared by word of mouth by the parties, and requiring in many cases to embody with perfect accuracy the statutory provision upon which it was based, it was now formulated in writing by the prætor, in the shape of an instruction to the judge to inquire and consider, with power to condemn or acquit according to his finding (see *infra*, p. 707).

Provincial Conquests.—The growth of commerce and the enormous increase of wealth, which made great capitalists and enabled them

through the agency of freedmen and slaves to carry on trade on a scale hitherto unknown, and which thus helped to foster the *jus gentium*, was no doubt due to a large extent to provincial conquests. But these operated also in other directions. The authorities who proceeded to the conquered provinces as governors found themselves face to face with laws and institutions in many respects differing from those of Rome. Political considerations dictated how far these were to be respected, how far subverted. In some provinces, more especially the Eastern ones, it was thought unnecessary to do more than supplement the existing system by the importation of doctrines of the *jus gentium* and the procedure of the prætor's edicts; while in others, in which it was deemed expedient to destroy as rapidly as possible all national feeling and every national rallying point, a Romanizing of all their institutions was resorted to, even to the extent of introducing some of the formal transactions which previously had been confined to citizens. But in either case there was a reflex action. The native institution had to be studied, its advantages and disadvantages balanced, the means considered of adapting it to the prætorian procedure, and the new ideas so presented as to make them harmonize as far as possible with the old. All this was a training of no small value for those who, on their return to Rome, were to exercise an influence on legislation and the administration of the law. They brought back with them not merely an experience they could not have obtained at home, but sometimes a familiarity with foreign institutions that they were very willing to acclimatize in Italy. Rome thus enriched its law from the provinces, deriving from them its emphyteutic tenure of land, its hypothec, its Rhodian law of general average, and a variety of other features that were altogether novel. Some of them were sanctioned by tacit recognition, others by edicts of the prætors; but, in whatever way received, they were indirectly fruits of provincial conquest.

Spread of Literature and Philosophy.—The effect on Roman Influence civilization of the addition of educated men in the later republic of literature and philosophy is a matter for consideration in connection with Rome's general history. It is not proposed to consider philosophy here the question how far specific doctrines of Roman law bear the impress of the influence of the schools, especially that of the Stoics; it is a subject much too large to be disposed of in a few lines.² The matter is mentioned simply for the sake of noting that the spirit of critical inquiry aroused and fostered by literary and philosophical study, seriously and conscientiously undertaken, contributed greatly to promote a new departure in jurisprudence that became very marked in the time of Cicero—the desire to subordinate form to substance, the word spoken to the will it was meant to manifest, the abstract rule to the individual case to which it was proposed to apply it. This was the first effort of what then was called equity to temper and keep within bounds the rigour of the *jus strictum*. The prætors, the judges, and the juriconsults all had their share in it. Although modern jurists are prone to speak of prætorian equity as if it were a thing apart, yet the same spirit was leavening the law in all directions and in the hands of all who had to deal with it, the difference being that the form and publicity of the edict gave to its applications by the prætors a more prominent and enduring record than was found in the decisions of private *judices* or the opinions of counselling juriconsults.

Decline of Religion and Morals.—It would be equally Decline out of place to enlarge here on the causes and manifesta- of religion and morals. tions of that decline in religious sentiment and public and private virtue which was fraught with such disastrous results in the later days of the republic. The private law was influenced by it to a considerable extent, alike in those branches which regulated the domestic relations and those which dealt with property and contract.

The ever-increasing disregard of the sanctity of the marriage tie is one of those features in the history of the period which strikes even the most unobservant. While from the first the law had denounced causeless separation and visited it with penalties, in principle it maintained the perfect freedom of divorce,—that it was improper to force persons to continue in the bonds of matrimony between whom matrimonial affection no longer existed. With the simple and frugal habits of the first five centuries

² It is one that was discussed with much greater fervour a century ago than it is now. Of the later literature may be mentioned—Van Vollenhoven, *De exigua vi quam philosophia Græca habuit in efformanda jurisprudentia Romana*, Amsterdam, 1894; Ratjen, *Hat die Stoische Phil. bedeutenden Einfluss gehabt*, &c. ? Kiel, 1889; Voigt, *Jus nat.*, &c., vol. i. §§ 49-51; Laferrière, *De l'influence du Stoicisme sur la doctrine des juriconsultes Romains*, Paris, 1860; Hildenbrand, *Gesch. u. System d. Rechts- und Staats-Philosophie*, Leipzig, 1860, vol. i. §§ 141, 142. The earlier literature is given in Hildenbrand, p. 598.

¹ See Labatut, *Histoire de la Préture*, Paris, 1868; Mommsen, *Röm. Staatsrecht*, vol. ii. p. 176 sq.; Karlowa, *Röm. Rechtsgeschichte*, vol. i. p. 217 sq.

of Rome, and the surveillance of the *consilium domesticum*, the recognition of this principle produced no evil results; family misunderstandings were easily smoothed over, and divorces were of rare occurrence. But from the time of the enactment of the Mænian law in 586 there seems to have been a change for the worse. It *inter alia* displaced the family council as a divorce court and transferred its functions in that matter to a *judicium de moribus*,—a court of inquiry nominated by the prætor, and having as its duty to decide to what extent there should be forfeiture of the nuptial provisions in case of separation or repudiation. The motives of the statute may have been of the best; but its tendency was injurious, for not only did it indirectly facilitate divorce, but it rendered the idea of it familiar, and overthrew that respect for the domestic council which had hitherto been a check upon it. What wonder that with increasing luxury and licentiousness divorce became so common!
